Exploring the Handi-johi.

* "Kaodi jahi" are two Dacotah words, and mean "gathering place of the buffalo fish."

It is surprising to me that Mr. Blackford, or some of the enterprising fishermen of the North, do not utilize our well stocked fishing grounds during the winter season. Fish as it is called in that quantity, is ice is very cheap, and we are seldom troubled with storms during the winter months. The hotels and boarding houses of our city would consume quite a quantity of sea fish if they could be obtained. The cities of Savannah and Charleston, and the cities and towns of Tennessee, Kentucky, and of the interior of Georgia and Alabama, and the English good markets. One steamship leaves Florida weekly, and another leaves New York, and leave our river weekly for Savannah and Charleston, connecting with steamships for Baltimore, Philadelphia, New York

and Boston. If our fish could be iced, forwarded and introduced into the northern markets during the winter months, I feel assured that they would find ready sale. If a steam fishing smack were used the fish could be taken to Savannah, placed on board one of the new steamers leaving for New York, and could be landed in the latter city in a little over fifty hours. In our river we have plenty of shad, mullet and sea trout, and if it was too rough to fish on the "banks," the men could engage in fishing with gill nets and seines. The mullet and trout would find a ready sale in Southern cities and the shad could be shipped North.

I have reason to believe that there is money for an enterprising crew in our coast fisheries, and if any of your readers feel disposed to engage in the business and wish information, they can address "Al Fresco," Jacksonville, Fla., and he will communicate any facts in his possession. AL FRESCO.
Jacksonville, Fla., June 25, 1878.

Fish Culture.

THE McCloud RIVER HATCHERY.

EDITOR FOREST AND STREAM:

The season's work here is well advanced. We have a large force of men at work, about a dozen, and as many Indians. The unusual high water of last winter did considerable damage to the place. The McCloud was higher than ever known before, and covered the whole place. The water rushed through the hatching house and swept out tanks, troughs, and every movable thing; carried away all the fluming and fencing, and it was feared at one time the buildings would go as the water was several inches over the floors, which he raised four feet from the ground, and tore away a part of the piazzas. The water that supplies the hatchery is raised from the river by means of a large current wheel, which rests on two boats. These boats were securely fastened with a wire rope and could not get away, but they were swept into the bank, and when the river subsided, were left high and dry. Small brooks running across the stage road, that in ordinary winters are easily forded, and cut in the summer are almost entirely dry, were rapid streams and impassable for the stage. All the damage done is about repaired now. The boats have been relaunched, flumes rebuilt, and the wheel is running, sending a stream of twenty inches through the hatching house, where new tanks have been built and one double line of troughs put up. Four more lines will be added, giving us 800 feet of troughs, room for 10,000,000 eggs.

The passage of salmon up the river was obstructed early this month. The piers were placed in the river the last part of June, and by the 4th of July the racks were in place and the river closed. Salmon is very abundant this year; very many have gone up to the headwaters, and below the racks the river seems alive with them. We have counted eighty jumping in a minute in the evening. On the 11th we made a trial haul with the seine and landed between a thousand and two hundred fish, of which many were young salmon, two and three years old. Of course they were all returned to the river again. The prospects for taking a large number of eggs this season is very good, and if we meet with no accident, hope to secure ten or twelve millions. The weather is very pleasant this summer, not as hot as usual, although to-day has been rather warm. Temperature 3 p. m.: Shade, 103 deg.; sun, 130 deg.; water, McCloud River, 69 deg. On the 4th we had a little rain, and in the evening the first thing in the morning we raised a handsome new flag, made by Mrs. Stone; then followed rifle and pistol shooting, foot races, Indian bow and arrow shooting by the Indians, a swimming match, and the most amusing of all, a wheelbarrow race. The course was over rough, uneven ground, and each contestant was obliged to wheel a large, round boulder the entire distance, and the efforts to make good the situation, and the barrow were very laughable. In the evening there was a display of fireworks, and the entire day passed very pleasantly. I must mention a pet we have—a young cinnamon bear. Some two months ago an Indian brought him here and Mr. Stone bought him. He was quite small, and as ungainly looking a creature as one can imagine. At first he cried almost incessantly, but as he had plenty to eat and perfect freedom, soon became reconciled to the situation, and improved very fast. He has increased in weight from eight pounds to twenty-eight, has a new coat of hair, and, in fact, is quite a handsome young bear. It is necessary to keep him tied up now, for he is so mischievous. He has a half-grown pup for a play-fellow, and they are excellent friends, though sometimes in frolic they pinch each other a little too hard, and then have a little spat, but it is soon made up. Jack is very sociable and does not like to be left alone at all. Jack frequently takes him out for a walk. He follows like a dog, but if he loses sight of Mr. Stone he immediately begins to cry.

Although there are many more Indians up through this part of the country than whites, which in these times of Indian uprisings causes some feeling of insecurity. I cannot think there is any danger to be apprehended from those in this vicinity. Some eighteen or twenty years ago they were very troublesome, but have committed many depredations, but were severely punished by the whites they have two wholesome dread of them to ever think of any more mischief. Many of them are quite industrious and find plenty of employment on the ranches. Some are engaged in mining over on Pit River and Squaw Creek, a few miles from here. Of course, there are some restless, unruly spirits among them who, perhaps, would like to "break out," but they are in a decidedly small minority.

The Pit River Indians mentioned in the papers as being unfriendly behaved up near the head waters of that river, some two hundred miles or more from here. We have heard that there have been runners among these Indians from the Pit River tribe, and also a Piute Indian, but think they did not accomplish much. K. B. PRATT.

A WISE SUGGESTION.—East Boston, Mass.—Editor Forest and Stream: Would it not be as well for the gentlemen, who have undertaken the commendable task of re-stocking Lake George with bass, to turn their attention, first, to some means of checking their wholesale destruction? Lake Malapog was stocked with bass more than twenty years ago, and under the natural course of things would now be swarming with them; but thoughtless boys, and men without conscience or consideration, are on the watch, in season and out of season, to catch them from their spawning beds as fast as they appear, thus

destroying hundreds for every one they catch. If the farmers, or others owning land around the lakes, or the hotel proprietors (whose interests are especially at stake), would adopt severe measures to protect the fish while spawning, an abundance of fish, in a year or two, would well repay them for their time and trouble. DRYMOS.

In the United States fish culture is at its maximum, but fish protection at its minimum. That is all there is about it.

FROM SETH GREEN.—Mr. Editor: In the year 1875 Mr. Nevell sent us 500 California brook trout spawn. We have now 300 fish raised from the above eggs. They weigh over a half pound each. We took 40,000 spawn from them this spring. We will raise 15,000 of them for breeding fish. I think they are a good fish to stock many of our streams with. They spawn in the spring, and will hatch in much shorter time than our trout, and are a much harder fish, and are game to the last and a good table fish. I can furnish any State or county or private parties with men that are practical fish culturists, and who could take charge of any works. Address, SETH GREEN, Rochester, N. Y.

The men Mr. Green proposes finding positions for are all practical and reliable persons, who have been in his employment for the last five to seven years. They have not only a knowledge of fish and how to hatch them, but are conversant with the waters adapted to fish. In fact, our friend, Seth Green, keeps a first-class fish school.

TROUT FRY.—We invite the attention of interested parties to the advertisement in another column of the Ludlow Trout Ponds.

Natural History.

REPORTS OF THE MUSEUM OF WESLEYAN UNIVERSITY.—The Fifth and Sixth Annual Reports of the Museum show it to be in a very flourishing condition. Through the tireless energy of Prof. G. Brown Goode its collections have recently been greatly increased, not only in size, but in real value, since they now contain the types of the numerous new forms discovered by this naturalist during his connection with the U. S. Fish Commission and his explorations in the West India Islands. At the close of the report for the fifth year we are told that the collection contained about 98,000 specimens of animals representing 11,000 species, about 6,000 specimens of 3,000 species of plants, about 10,000 specimens of 400 species of rocks and minerals, and about 500 specimens in ethnology, a total of 115,000 specimens. Since that report was presented the results of seven months' exploration in the Bermudas, six by Professor Goode and one by Professor Rice, have come to hand and are represented by sixty-five barrels, boxes and crates filled with alcoholic specimens, shells, plants and geological collections. This material will be submitted for study to leading specialists, who will report to Professor Goode on the collections.

As the Museum of Wesleyan University was first organized in 1871, we cannot but feel surprised and gratified at its rapid progress since that time, a progress wholly due to the earnestness and enthusiasm of those who have it in charge.

FOUR NEW BIRDS FROM THE WEST INDIES.—We have just received an interesting paper, describing four new species of birds from the islands of Grenada and Dominica, through the kindness of the author, Mr. Geo. N. Lawrence. In this contribution to our knowledge of the ornithology of these islands, read before the New York Academy of Sciences, Mr. Lawrence defines *Turdus caribbeus*, *Thryothorus grenadensis*, *Claytonia brunneicapillus* and *Quiscalus lutescens*. *Claytonia brunneicapillus* was given by the author as *B. blancoi* in his "Provisional List of the Birds of Dominica," published in FOREST AND STREAM of Dec. 6, 1877, but additional material, and an opportunity to compare the former with Dr. Gundlach's type of *Blancoi*, has convinced Mr. Lawrence that, although closely allied, the two species are distinct.

The specimens on which these descriptions are based were recently received from Mr. Ober, and the types are now in the Smithsonian Institution at Washington.

THE WAIF OF THE SEA.—The Carolina rail, which was caught 350 miles at sea by Lieut. Commander Evans, of the U. S. steamer Saratoga, has been sent by us to Mr. Cooklin, the Director of the Zoological Department at Central Park. There the bird, in a large and commodious aviary, will have better chances of life than in a small cage in a newspaper office. During the four days he was in our office the bird had become quite tame. If ever a bird deserved to live this Carolina rail did.

SAID AND BACHITA.—Two Nubians are they, and the prettiest little hippopotami you could want to look at. It is not often that in describing these beasts the final plural "i" can be used. We generally speak about seeing a hippopotamus, but in this case there are two hippopotamuses. These two creatures, with the most engaging mouths in the world, studded with nascent tusks, arrived here on the Rhine from Bremen on Saturday, and are now lodged in the Aquarium. They were captured last February in Nubia by one of Reiche's expeditions. The two beasts are male and female, Said, the masculine representative, being somewhat the heavier of the two. Both of the hippopotami will weigh together fully 500 pounds. Dr. Kohn of the Aquarium, who had the last hippo in charge, will lavish now his affection on this pair, and will make them as docile as the last one—Baby—which died. On being introduced into the Aquarium, they took to the water

with huge delight, playing in it like kittens. Their food is milk, as they have not yet been weaned—the milk strengthened with a dozen or so of the yolks of eggs. These are the only pair of hippos at present in the world, and all New York ought to go and see them.

THE NOTE OF THE MIGRATORY QUAIL.—Williamsport, Pa., July 3.—Mr. Editor: I have taken great interest in the attempts—which now promise to be successful—to acclimatize the migratory quail in this country. There is one pleasant feature about this bird that I am surprised none of your numerous correspondents ever mentioned, and that is their exceedingly pleasant song or call note. We had one in confinement, procured from a New York bird store, for a number of years, and every spring or summer morning, even before the wood thrush or robin thought of shaking up their little feather buds, preparatory to singing their morning prayers, the clear, metallic notes of the quail, in its German *Wachtel haas*, would stir the morning air. These notes, although not as sweet and melodious as old Bob White's, can be heard a longer distance, and, as before remarked, have a peculiar metallic ring about them, from which I presume the expression, *schlagen* (German for "to strike"), comes. The German does not say "The quail sings," but "The quail strikes (*schlagt*). After a preliminary strut and a guttural cluck! the quail raises itself to its full height, and then from three to eight times it repeats, as near as can be written, "Plek-per-a-wick!" There is a pause of perhaps a second between each sharp and clearly defined note. After the last note there is a pause of two or three seconds before repeating. Throughout perfect time is kept. BOBOLINK.

NESTING OF THE MISSINA QUAIL.—We are very thankful for the welcome tidings given below. We shall promptly publish information of the young birds, sent by our numerous friends all over the country who have promised to give us the earliest news of the mating of these new-comers: Mr. Editor: I have good reason to believe that a pair of the newly introduced European quail has nested and hatched the present season in this place. Visiting a friend who lives on the outskirts of the town yesterday, he reported having twice seen a quail (with young) which he was sure was not our importation, having apparently long been equally pointed wings. I shall take an early opportunity to follow this up; but a sure identification can of course be made only by shooting one of the birds, which must not be done yet awhile. We will report further when able. F. C. BROWN, Framingham, Mass., August 2.

Mr. Editor: The migratory quail imported by the Salisbury Game Club last spring are doing finely, several broods of young ones having been seen, and their calling, which as much resembles the "twit, twit, twit" of a young turkey as anything, is to be heard all over our fields. If sportsmen generally will let them have a few years to get established here, we feel sure of success. We should like to hear from the other importations of this spring. If all have been equally pointed with our club, we should have a fine stand by fall. Our farmers like the birds very much, and think that they kill bugs and worms enough to more than pay for the grain they expect them to eat this fall. W. H. V. Lakeville, Conn., Aug. 5.

AN ALBINO SWALLOW.—Mr. W. B. Garrahou, of Newark, informs us of having killed an albino swallow, but unfortunately his choice-brood spoiled the bird as a specimen. He was not pure white, our correspondent writes us, having two light but colored feathers in his left wing. His eyes were black, with legs and feet of flesh color.

ABNORMAL BIRD'S EGGS.—Editor Forest and Stream: June 20, 1878, Mr. John H. Sears collected a nest of the golden-crowned thrush (*Sialia auricapilla*) at Boxford, Mass., containing four eggs, three of which were of the normal form, and of distinctive size and markings. The other was of an elliptical form, and of unusual size. The rest of the series were of the normal form, and were selected this spring. ARTHUR F. GHAZ. Danversport, Mass., July 29, 1878.

READ THE PAPER MORE CAREFULLY.—A correspondent, writing from Pittsfield, Mass., under date of July 15, says: "Is it a usual thing for the red squirrel (*Sciurus hudsonicus*) to be carnivorous? Having always considered them strictly vegetarian, was more than astonished to see one eat a young robin, taken from the nest on Thursday, 13th. We were informed by the farmer and his family, who were much excited over the occurrence, that that was the second bird taken from the nest in two days. On further inquiry we learned that the red squirrel also catches and eats mice."

We dislike to have to give up our really valuable space to questions that we have answered time and again. If our correspondent will refer back to our issue of June 37 he will find his question answered in the "Natural History" column.

A FOND FOSTER-FATHER.—Our friend, Mr. S. W. Williston, writing to us from Maclean, Kansas, relates the following very interesting incident. He says:

"My sister here has a male *Cardinalis virginianus* that has been lived in a cage of newly-hatched birds. The male's more or less were put in his cage a few weeks ago, and since that he has devoted his whole time to rearing them. He has stopped his singing and feeds them assiduously, and when turned into an empty room is trying to teach them how to fly. It is extremely comical."

ROBINS POISONING THEIR YOUNG.—The Lancaster Intelligencer says:

"Two robins in Westchester recently fed their offspring on poison vine because the children had caged them. It is characteristic of these birds to poison their caged young when no hope of their liberty is offered."

A very old idea, but whether it has any foundation in fact is doubtful.

NEW YORK FLOWER AND FRUIT MISSION.

(Extracts from the Reports of 1876 and 1878.)

THERE is an Arab proverb—"If any man have two leaves of bread let him exchange one of them for the flowers of the Narcissus; for bread nourishes the body alone, but to look on the Narcissus feeds the soul." It is to satisfy the hunger of the soul that the Flower Mission came into being. What it has accomplished during the past eight years is now so well known that it seems hardly necessary to defend our existence. Still, if here and there some skeptics are to be found who exclaim: "What, all that fuss over a few roses and strawberries! Do you think it is worth while?" to them we would say: "Is it not worth while to bring such cheer into crowded pauper hospitals, that the physician says, 'Even the operations are more successful on flower day, for then the patients seem to take courage? Is it not worth while to carry a bunch of grapes to the old woman dying alone in the attic of a Baxter street tenement and hear her murmur with tears in her eyes, 'Ah, but my lady, the best is, they taste so sweet to my heart? Is it not worth while to bring the 'glory of the lilies' into the darkened lives of that great multitude of struggling, starving, and sorrowing beings living in the depths of our great city, to show those whom, perhaps, words would never reach, the purity and blessedness of Him whose loving heart yearneth after them?"

Those of us who have accompanied the flowers on their mission have seen how a few violets softened the heart of a poor suffering girl who had been preached and prayed over in vain, and that a bunch of roses often brought new life to a sufferer whom medicine had failed to relieve.

If those skeptics who think that charity should be confined to soup and bannet, the necessities of life, could have witnessed the joy with which the "Flower ladies" were received on their first visit to one of our great Charity Hospitals, we think they would have been more ready to believe that, after all, now as of old, we do not live by bread alone.

At first the patients to whom the little bouquets were offered, though looking at the flowers with longing eyes, all said they "didn't care for any that day;" but at last one poor girl, almost too far gone in consumption to speak, exclaimed, in broken tones: "Indeed, I would give anything for one of them roses, may I have one?" and so it went. And so we explained that the flowers had been sent as a gift by those who, although strangers, had thought about and felt sorry for them in their suffering, the news seemed too good to be true. These poor creatures were so accustomed to be forgotten by the outside world, that at first they could hardly realize this touch of brightness which had come in to them; but in a few minutes, however, all those who had been placed by the flowers around our buckets, began to cry in single file, while those who were too sick to be out of bed were beckoning to us with a most pitiful eagerness. We shall long remember the joyous tones of a poor crippled girl, who limped off on one crutch, waving the other in the air, and shouting at the top of her voice: "Look a here, girls; git up, git up; here's some ladies with a lot of flowers to give away for nothing."

The joy and feature of the occasion was that, though our bouquets were of the smallest, possible dimensions, we could not make enough to supply the eight hundred patients, and the disappointed looks of those who were passed by were most trying to us.

When we visited the hospital again, several weeks after, many of the patients had allowed the dried flowers, which they were given, to blow away till you brought some more."

When we had not flowers enough to go round—too often, alas! the case in our great hospitals—preference was always given to those confined to their beds, and the various subterfuges to which the convalescents resorted to secure the much-coveted bouquets were most comical. One old blind woman, though well enough to be up and dress, and to get up, would not let the flowers go, begging for one in single file, while those who were too sick to be out of bed were beckoning to us with a most pitiful eagerness. We shall long remember the joyous tones of a poor crippled girl, who limped off on one crutch, waving the other in the air, and shouting at the top of her voice: "Look a here, girls; git up, git up; here's some ladies with a lot of flowers to give away for nothing."

During the past summer (1877) every hospital in this city and vicinity, from Chambers street to Hart's Island, has been visited by the Flower Mission, and the unanimous testimony of the nurses and physicians in charge as to the good actually accomplished, has been most encouraging.

But a branch of our work which has greatly increased within the last two years, and to which we would now call special attention, is the distribution of fruit and flowers among the sick poor in tenement houses. This has been done chiefly by the aid of Bible readers, City Missionaries and Children's Aid Society visitors. Last summer over 11,000 bouquets, with large quantities of oranges, lemons, grapes, strawberries and currants were taken to such cases.

The miseries endured by the sick in a New York tenement house during the intense heat of our summer can scarcely be exaggerated. Without the distribution of fruit and flowers among our charity hospitals; with a scanty supply of the most unpalatable food; with absolutely none of the comforts which alleviate the sickness of our own dear ones; breathing the stilling atmosphere of a tiny room which often serves for a kitchen as well as a chamber, what wonder is it that every summer the mortality list of our poor rises to thousands. After seeing the surroundings of many such a sufferer, one only can be thankful that he is able to live. We are sure that in perhaps with some disease which cannot be admitted into the ordinary hospitals, friendless, losing faith in God and man, it is to such that the Flower Mission goes. The cluster of roses, the basket of fruit fresh from some country garden, and the few words of sympathy given week after week, bring a cheer and comfort that are often the first steps to recovery. And if, as is also often the case, the struggle for life is too hard for the sick children, enfeebled by bad air and lack of food, the Flower Mission has comforted the heart of many a poor mother by laying on the coffin of her little one, who was as dear to her as yours are to you, the bunch of flowers picked and sent by some other child, whose happier lot was to live in God's blessed country.

Tossing upon the straw pallet laid so often on the bare floor of a tiny room, which serves for kitchen as well as chamber, in the stifling heat of a New York July day pouring in, a cup of warm water and a bit of bread the only food—one can well understand how the gift of a bunch of delicate wild flowers, fresh from the fields, an orange and a few kind words seem almost like a glimpse of heaven. One little girl, who lay on the floor mourning her life away with a hopeless disease, said, when she grasped the little bouquet and looked up to see a lady holding out a bunch of white grapes, "Is it an angel, mother?"

As one of the flower ladies climbed, last summer, the steep stairway which led to an upper tenement, where a little boy had lain sick for weeks, she was met by the weeping mother, who said: "Oh, man, Johnny died this morning, but do come in and see him." There on a bed of rags lay the little boy, his eyes closed, his lips cold, his hair matted, and his face as white as a sheet. "It's the one you brought him last Monday. I couldn't get it away even to put it in the water, and last night, when he was a little out of his head, he kept saying, 'Don't it smell like the country, mother?'"

One woman, who had been confined to her bed nearly two years with a most painful disease, was delighted by the gift of a little bunch of pink slips. Some friends had taken her to the hospital, and she had been placed in the wretched room she occupied. Day after day she watched it with the greatest interest, counting every new leaf that came out. As she grew worse and worse, it was almost her only pleasure, and the day before she died, as her last request, she begged it might be taken over and placed on her grave.

The summer of the ladies' visit with the Mission made it her work to take a week's basket of flowers and visit the various tenement houses in some of the most wretched quarters of the city. She sought out especially the sick, but also gave as far as possible a single rose, a spray of lilacs, or, what among the Germans was always most highly prized, a piony, to any poor woman who seemed to specially care for just such a gift. Going into some of these rear-lying, windowless rooms, and finding the sick and dying, and the children, who were quickly surrounded by a crowd of women in every stage of wretchedness, and the eagerness with which they begged for a single flower was really pitiful. These were not children, but grown women, from the tottering grandmother who could hardly crawl along, to the young girl worn misery and want had made a woman of almost before she was twenty.

If the lady had brought a basket of bread to distribute, not half the excitement would have been caused. It was as if the wealth of the Indies had been offered them. One poor creature said, with tears of joy in her eyes, "Why, I never had a bouquet in all my life before." And another exclaimed, as she took the pure and fragrant lily of the Annunciation (a flower to which especially welcome was placed a cross of wood Heart, and said, "I never saw it through every street in New York you couldn't find a sadder or more wretched woman than I." Sometimes they would almost overwhelm the flower lady in their anxiety lest there should not be enough to go around, but some stout-fisted woman was always found to offer herself as a protector, to say as one of them really did, "I'm just going to see that, there ain't, my family in this house mean enough to want two bouquets."

One hot day last July this lady found her way with her basket to the upper story of a great tenement house, knocking at several doors without response. At last a feeble voice was heard to say, "Come in," and there she found in a dark bedroom, having light only through a door opening into another room, a woman in the last stages of consumption. She was sitting alone on the floor, and she had placed a cross of bread and a cup of water. When asked if she had nobody to take care of her, she answered, "There is only my husband and me, and if he should stay at home he would lose his work. When I cough very hard I do feel a bit lonely, but then the neighbors come in sometimes, and it isn't as bad as you'd think." She could hardly realize that the bunch of fragrant lilies was really for her, and said, "Oh, how happy, how happy I am; now I shan't be afraid of dying alone with them by me."

The avenues are continually opening before us. One day last summer a large box of flowers came to our rooms too late in the afternoon to be taken to any hospital. Having heard that there was to be a meeting held that evening at a mission among fallen women in one of the worst quarters of the city, we were suggested that we send the loose flowers there, which we did.

The next day the missionary in charge came up to tell us of the excitement they had caused. At the close of the meeting it was announced that some flowers had been sent, which would be given out to all those who cared to wait for them. The women were almost wild with delight, and crowded around, begging for even a bit of green. One poor girl was

found in the corner of the room sobbing piteously over a faded rosebud of a kind "just like those which used to grow in mother's little garden at home." Several of the most hardened women went away in tears, hugging their flowers to their bosoms.

The lady in charge said, "The great difficulty has been to induce the girls to come to our meetings, but if you would only send us flowers sometimes I really believe we could be the means of saving some of these poor creatures."

But not for flowers alone do we appeal. We would remind you most earnestly how acceptable, not only fruits of all kinds, but even the fresh vegetables which you have in such profusion, would be to our sick here. The poor in tenement houses have not even the comforts of the hospitals. Imagine your own loved ones trying to recover from a fever on a diet of lumps of greasy soup of the toughest description, with the occasional luxury of some wretched vegetable which has been kept in the market until its price has fallen to the limits of the poor man's purse. Think of the young girl dying with lingering consumption (brought on by overwork and exposure), with only a crust of bread and a cup of water, not even cold, to tempt her appetite.

But while dwelling upon what yet remains to be done, we would not forget to thank most heartily those friends whose generous contributions in the past have already enabled us to accomplish so much. And list, the various express companies to whose liberality we are most deeply indebted. Indeed, but for their generous offer to bring us packages free of charge, our work could not have been carried on. It has been a great gift, and one which we all appreciate. Even the expressmen have taken the liveliest interest in the Flower Mission, and when staggering up to our rooms with the heavy baskets and barrels they so often bring, their cheer, "Well, we've got a splendid load for you to-day," was always encouraging.

Then to the children, who have ever been among our best friends. Many day-schools in neighboring towns have made most liberal contributions, and several Sunday-school classes of young people, who have loved the flowers they have themselves collected and made into little bouquets.

And lastly, our warmest thanks are due to the hundreds of friends throughout the country who have taken such a hearty interest in the New York Flower and Fruit Mission. They have made us most liberal contributions of both flowers and fruit, whose collection and packing have often cost them real personal sacrifices. It is to their efforts that the success of our work is due, and, as the summer draws near, and we would every individual contributor by letter, we would say here that more thanks and blessings have been bestowed by the grateful recipients of their bounty than would suffice to reach every one of them. During the past season forty towns sent us regular weekly contributions, while from thirty-eight others occasional contributions were received. In many of these towns the Flower Mission has been organized, and forward flowers and fruit, and we would recommend that our plan should be carried out whenever practicable, as so much more is accomplished by organized and systematic effort. In order to form such a branch it is best to have notices given in the churches and newspapers that contributions for the New York Flower Mission will be received once or twice a week at some specified hour. Then appoint a committee to urge people to send, and if only a few flowers or a handful of forward flowers and fruit, and we would recommend that our plan should be carried out whenever practicable, as so much more is accomplished by organized and systematic effort. The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, sign of suffering, etc.

THE MINNESOTA FIELD TRIALS AND BENCH SHOW.

ST. PAUL, July 30, 1878.

MR. EDITOR.—It is a matter for congratulation and a hand-shake all around, that the prospects of a completely successful show and field trial here next September are so brilliant. Assurances strengthen as plans mature and letters arrive at the headquarters of the Kennel Club. There is no doubt a wide-spread interest felt in the coming events. The exhibits of the Bench Show will not be confined to Western dogs, and I know it to be the intention of one Boston gentleman at least to enter the pick of his kennel in competition with dogs which have been broken on game not known in New England. As usual, Mr. Charles Lincoln's efforts have been most happily directed and employed, while his experience in the management of similar affairs, his acquaintance with sportsmen and dogs all over the country, and his general knowledge of the physical features of geographical sections and the habits of game, are felt to be invaluable. The advantage of personal acquaintance with men, and the attributes of their dogs, cannot be too highly estimated. By some logical sequence of fortuitous circumstances Mr. Lincoln has gradually drifted into the position of Superintendent of Bench Shows; and I now consider his aid and advice, gathered from long experience, quite as essential to a proper presentation and a satisfactory result as those of a general officer would be in an engagement. It is the same kind of discipline and education—a gradual growing into and annealing of the work, as it were, which gives to FOREST AND STREAM its vantage ground among journals, and enables it to know and administer to the requirements of its constituency with the same intelligence and sagacity that a physician diagnoses a disease.

I regard the Minnesota Field Trials as most important in their immediate and ultimate bearing upon the whole subject of dog culture and selection. Hitherto our field trials have been run on quail only, the latitude of whose habitat is wider than the range of the speckled trout. Dogs are more generally broken on quail than on any other single variety of bird, taking the entire area of our country into the account. Of course I do not mean to intimate that the dog so broken may not be a good all round dog, equally staunch on woodcock, ruffed grouse, snipe, etc.; but to the nose of three-fourths of the dogs in the country the scent of the prairie fowl is a stranger, and we are anxious now, not only to inspect the work of western-reared animals at home, but to note and compare with theirs the performances of our Eastern and Southern dogs in scrub oak and grass. We wish to learn what constitutes a thoroughly competent dog; whether any special qualifications are requisite for prairie work; and whether, in the opinion of the judges, Mr. A's dog, of Boston, is an inferior animal to B's dog, of Kansas, only because he fails to pick up his points on *pedicetes phasianellus*. Rule 9 of the N. A. Kennel Club requires dogs to discriminate between plover, snipe, etc., and the quail and grouse which he is being hunted on, but it awards no demerits for pointing terrapins, shoats, and stink-birds. There is a delicate question involved here, which I hope the keen perception of the judges will be able to decide; for (I am pleased to state) the rule referred to has been scratched.

It was my good fortune to be present last night at a meeting of the Kennel Club, held in the Court House, to adopt a scale of points for judging the Field Trials, or rather, to adapt those of the National Kennel Club to the conditions of the coming competition. Certain changes were made with much care, after conferring with prominent sportsmen in many States; but it is particularly desired that fanciers and owners of dogs shall bear in mind that the schedule in question applies solely to the forthcoming trial—on sharp-tailed grouse. Two more points have been allowed for nose, and with very good reason. Birds lie much better to dogs which wind them than to those which track; or rake; and if nose is to be depreciated we may as well hunt with a greyhound (who hunts by sight only), as with setters and pointers. The scale of points as reconstructed now stands:

SCALE OF POINTS FOR JUDGING THE FIELD TRIALS.	
Merits.	
5 points.....	25
Backing.....	8
Nose.....	7
Face.....	10
Style.....	5
Quarterming.....	5
Retrieving.....	5
Total.....	60

In the puppy trials no merits or demerits are to be allowed for retrieving; also the rule requiring puppies to be drawn and work singly, is cancelled. It is also to be left to the judges to decide whether points made are true or false.

I cannot reconcile myself to the negative value placed upon retrieving, especially as applied to setters, whose ancestors were retrieving spaniels. To ignore this quality in a setter is simply to bar one of his chief natural characteristics. It is an English prejudice that too close contact of game with the nose injures the scent, but I am inclined to pin more faith on the natural propensity of the setter to fetch and carry than on the opinion of men. Of the pointer I have nothing to say; and while I advance the foregoing thoughts, I admit that the question is a delicate one, for which there is still room for much more discussion.

The great charm of the coming Field Trials will consist in the fact that they are to be held *en bivaque*. The entire army of owners, handlers, judges, exhibitors and commissaries are to go into camp by one of the most beautiful lakes near Sauk Centre, in Stearns county. I know the region well as one of the best in the State, with an abundance of birds, a magnificent outlook and unsurpassed natural scenery. The advantages of a bivaque on the field, with an early start, fresh dog and fresh man, will be appreciated by those sportsmen who are wont to rise with the lark to bag the early bird that catches the worm. What an experience can be more charming to men to whom the prairies are a novelty! As an Eastern man, sojourning here for a brief period, I can truly say that no trip or experience can be more enjoyable to Eastern men than a jaunt to Minnesota next September. Birds are unusually abundant, and the breadth of stubble will be vast; and after the formal trials are over sportsmen will have only to lapse confidently into the hands of those hospitable Western friends, who are more than anxious to do them service and honor. Here will be an opportunity not often afforded to come to what was so recently the Far West, and to enlarge one's ideas in the proportion afforded by 3,500 miles of travel. The railroads are, as usual, liberal and fares are much reduced.

Mr. Charles Lincoln has been kind enough to supply you with current notes of the events to come, and through his courtesy I am enabled to send you the following list of special prizes, which will be much enlarged:

For the best English setter stud dog, to be shown with two of his get, Messrs. M. F. Kennedy & Bros., manufacturers of fine guns, offer a handsome Smith & Wesson revolver, pearl handle and silver mounted, suitably engraved, value \$25.

For the best English setter brood bitch, to be shown with two of her progeny, a splendid silver cup, value \$25, presented by the Metropolitan Hotel.

For the best Irish setter stud dog, to be shown with two of his get, a splendid silver cup, presented by the Merchants' Hotel, value \$25.

For the best Irish setter brood bitch, to be shown with two of her progeny, a splendid silver cup, presented by the Windsor Hotel, value \$25.

For the best Gordon setter stud dog, to be shown with two of his get, a splendid silver cup, value \$25.

For the best Gordon setter brood bitch, to be shown with two of her progeny, a splendid silver cup, value \$25.

For the best pointer stud dog, to be shown with two of his get, a splendid silver cup, value \$25.

For the best pointer brood bitch, to be shown with two of her progeny, a splendid silver cup, value \$25.

For the best dog or bitch, of any breed, most suitable for ducking purposes, Capt. Lee Davis offers a splendid trout rod, value \$20.

For the best collection of fox hounds, to consist of not less than three couples (dogs or bitches), a splendid silver mounted rifle, presented by S. B. Dillay, Esq., of Lake City, value \$50.

For the best cocker or field spaniel (dog or bitch), prize \$10, presented by W. B. Burkhardt, Esq., dealer in sportsmen's goods.

For the best greyhound (dog or bitch), Messrs. Myers & Finch, jewelers and manufacturers of silverware, offer a splendid silver cup, value \$25.

St. Louis Ball Co. have presented 2,000 shells to begin to the best Gordon setter stud dog, to be shown with two of his get.

By the way, I may mention as an incident of the approaching competition, that I have met Mr. George B. Clason, of Milwaukee, who offers to run after the main trial a brace of 6 months pups by Royal Duke out of Gift, against Mr. J. H. Whitman's Berkenthall's Rake out of native Pearl. Mr. Clason is a most proficient sportsman and earnest advocate of the silent system of training and working dogs; and when we allow that the trained dog reflects the character of the man, it is easy for us to judge "what a man he's kind of," as the Dutchman says. The performance will be a most interesting one.

P. S. I hope to send you the fourth letter of my regular series in time for your next issue.

LIST OF PREMIUMS—MINNESOTA BENCH SHOW.

DIVISION 1—SPORTING DOGS.

[Note.—No Dog or Bitch can compete in classes numbered 3, 4, 5, 9, 13, 14, 16, 17, 21, 22, 26, 27, 28 and 29, that has ever won a first prize at Chicago, Baltimore, New York, St. Louis or Boston. All other classes are "free for all."]]

Class 1—Champion Imported English Setter Dogs. Free for all. Silver cup, or \$30. Class 2—Bitches. Free for all. Silver cup, or \$30.

Class 3—Imported English Setter Dogs. Silver cup, or \$20; second, silver cup, or \$10. Class 4—Bitches. Silver cup, or \$20; second, silver cup, or \$10.

Class 5—English Setter Puppy, dog or bitch, under 12 mos. Silver cup, or \$10; second, silver medal.

Class 6—Champion Native Setters, of any strain. Free for all. Silver cup, or \$30.

Class 7—Champion Native Setters, of any strain. Free for all. Silver cup, or \$30.

Class 8—Native English Setter Dogs. Silver cup, or \$20. Second, silver cup, or \$10. Class 9—Bitches. Silver cup, or \$20; second, silver cup, or \$10.

Class 10—Native English Setter Puppy, dog or bitch, under 12 mos. Silver cup, or \$10; second, silver medal.

Class 11—Champion Irish Setter Dogs. Free for all. Silver cup, or \$30. Class 12—Bitches. Silver cup, or \$30.

Class 13—Imported Irish Setter Dogs. Silver cup, or \$20; second, silver cup, or \$10. Class 14—Bitches. Silver cup, or \$20; second, silver cup, or \$10.

Class 15—Irish Setter Puppy, dog or bitch, under 12 mos. Silver cup, or \$10; second, silver medal.

Class 16—Native Irish Setter Dogs. Silver cup, or \$20; second, silver cup, or \$10. Class 17—Bitches. Silver cup, or \$20; second, silver cup, or \$10.

Class 18—Native Irish Setter Puppies, dog or bitch, under 12 mos. Silver cup, or \$10; second, silver medal.

Class 19—Champion Gordon Setter Dogs. Free for all. Silver cup, or \$30. Class 20—Bitches. Free to all. Silver cup, or \$30.

Class 21—Gordon Setter Dogs.—Silver cup, or \$20; second, silver cup, or \$10. Class 22—Bitches. Silver cup, or \$20; second, silver cup, or \$10.

Class 23—Gordon Setter Puppies, dog or bitch, under 12 mos. Silver cup, or \$10; second, silver medal.

Class 24—Champion Pointer Dogs. Free for all. Silver cup, or \$30. Class 25—Bitches. Silver cup, or \$30.

Class 26—Pointer Dogs over 50 lbs. weight. Silver cup, or \$20; second, silver cup, or \$10. Class 27—Bitches over 50 lbs. weight. Silver cup, or \$20; second, silver cup, or \$10.

Class 28—Pointer Dogs under 50 lbs. weight. Silver cup, or \$20; second, silver cup, or \$10. Class 29—Bitches under 50 lbs. weight. Silver cup, or \$20; second, silver cup, or \$10.

Class 30—Pointer Puppies, dog or bitch, under 12 mos. Silver cup, or \$10; second, silver medal.

Class 31—English Retrievers, curly or wavy coated. Silver cup, or \$15; second, silver cup, or \$10.

Class 32—Chesapeake Bay Dogs. Silver cup, or \$15; second, silver cup, or \$10.

Class 33—Irish Water Spaniels. Silver cup, or \$15; second, silver cup, or \$10.

Class 34—Cocker Spaniels. Silver cup, or \$15; second, silver cup, or \$10.

Class 35—Field Spaniel, other than Cockers. Silver cup, or \$15; second, silver cup, or \$10.

Class 36—Box Hounds. For the best couple, silver cup, or \$15; second, silver cup, or \$10.

Class 37—Beagles. Silver cup, or \$10; second, silver cup, or \$5; Class 38—Dachshunds. Silver cup, or \$10; second, silver cup, or \$5.

Class 39—Fox Terriers. Silver cup, or \$15; second, silver cup, or \$10.

Class 40—Greyhounds. Silver cup, or \$10; second, silver cup, or \$5.

Class 41—Scottish Deerhounds. Silver cup, or medal, \$15; second, silver cup, or medal, \$10.

DIVISION II—NON-SPORTING DOGS.

Class 42—Mastiffs. \$5; second, silver medal.

Class 43—St. Bernards. \$5; second, silver medal.

Class 44—New Foundlands. \$5; second, silver medal.

Class 45—Shepherd or Collie Dogs, rough or smooth coated. Silver cup, or \$15; second, silver cup, or \$10.

Class 46—Dalmatians or Coach Dogs. \$5; second, silver medal.

Class 47—Ball Dogs. \$5; second, silver medal.

Class 48—Bull Terriers. \$5; second, silver medal.

Class 49—Black-and-Tan Terriers. \$5; second, silver medal.

Class 50—Skye Terriers. \$5; second, silver medal.

Class 51—Yorkshire Terriers. \$5; second, silver medal.

Class 52—Scottish Terriers. \$5; second, silver medal.

Class 53—Pugs. \$5; second, silver medal.

Class 54—Italian Greyhounds. \$5; second, silver medal.

Class 55—Poodles. \$5; second, silver medal.

Class 56—Miscellaneous. For any breed of dogs that have not been named, a silver medal.

Class 57—Trick Dogs. For the best performing Trick Dog a silver medal.

WHAT IS A NATIVE?—The following question has been put to us by Mr. W. Arthur Wheatley, of Memphis: "Joe, Jr., was conceived and born in this land. His father had been here for years, and his mother is several generations removed from any imported strain, and is of Irish, English and Gordon stock mixed. Question: Is Joe, Jr., a native?" Answer.—Joe, Jr., is a native. The same rule applies to dogs in this matter as to man or any other animal. There can be no official organization which has the power to make arbitrary rules applicable to a dog, so as to determine when he becomes a native. The race-horse is imported or native, according as he is bred in this or some other country. It is the same with a man. This can be verified in regard to the man at any bureau of naturalization. The question as to whether in this case Joe, Jr., is a native requires no argument. The opinion that the dog in question is a native can be proved by the best authorities in New York.

FEEDING DOGS ONCE A DAY.—Editor Forest and Stream: For the past eight years I have owned a dog, and most of that period several dogs; sometimes to the number of five and six. I have preferred to have my English setters fed once a day and tan. My rule is to feed them once during the day, and I doubt any one can show three healthier, stronger or better looking dogs of the same breeds. I am not troubled with skin humors or weak eyes in my dogs, for I think the great portion of diseases of dogs arises from over-feeding. My setters I feed about 5 p. m., giving them all they want. If they clean the dish I get more, and as soon as they leave the dish with food on it I take it away. In the morning they are not hungry, and do not wish for food then. If I am going out for a day's gunning I put some crackers in my pocket, and after they have worked an hour or two give them a bite. This fall I shall use Spratt's cakes. I should like to hear from some dog owners, and if those who have dogs with skin diseases breaking out every little while would try the feeding once a day method, they might be less troubled. Of course I don't break a dog from three meals down to one per day immediately, but do it gradually. PAUL.

West Babylon, Mass.

Without agreeing precisely with our correspondent as to the one-meal a day idea, what we do think is that a great many dogs are over-fed. In the numerous tests of maladies, cures for which are asked of us, our diagnosis generally shows that half the diseases in adult dogs arise from a surfeit of food. A light breakfast for a dog is wise, and the great bulk of the food should be taken by the animal at about 5 o'clock in the afternoon. Still, in working a dog the case is different. We are quite certain that a light meal before starting in the morning is good and proper. You must have something in the dog to draw upon. Like a good traveler who doesn't know where he can get the next meal, and always takes a good truck before starting on a journey, it is wise to give a dog something before going into the field. The excellence of Spratt's biscuit lies in the fact that three or four of them can always be carried in the sportsman's pocket, but then one can't always get the biscuit. We have known, if it can be o

any advantage to our correspondents, of horses on heavy work only getting one meal a day and doing well. There was a case of a man, lately recorded in the public prints, who never ate but one meal a day, and was well and happy. Still, such a condition we consider as abnormal.

A DASTARDLY OUTRAGE.—The poisoning of dogs seems to be on the increase. We call attention to an advertisement in our paper, where \$50 is offered by Dr. Stubb, of 136 Dean street, Brooklyn, for the discovery of the malicious person who poisoned a fine Newfoundland dog. This case seems to be a most aggravated one, as the dog was known to be kind and gentle. A good sentence, with a term of imprisonment if a heavy fine were not paid, would inculcate a good lesson.

THE SHEEP QUESTION.—Mr. Editor: In reply to your query, Will female dogs worry sheep? I must say they will. A very fine pointer bitch owned here by Thomas Haeist was shot while fastened to a sheep, so there could be no mistake about it, as both bitch and sheep were killed by the same discharge. In defence of the bitch, I must say that her education had been sadly neglected. J. O. F.

AN ADMIRER OF PODGERS.—*Savannah, Ga., July 23.*—Mr. Editor: I have read with great pleasure in your paper of July 4 a letter from "Podgers," of San Francisco. I would like to meet this gentleman and be able to "talk dog" with him. I have owned dogs from childhood, and never saw anything in print or heard any one say before what so exactly met my views of our four-legged friends as does "Podgers." I now own a Gordon and a pointer, both trained by me, and I understand them and they me in every word and look. My dogs are as good as I, but for the good reason that I do not think many can beat them. We often talk together, and every night my pointer, Punch (who has his liberty at night, being more sedate than Don, the setter, and not so much given to roaming), comes to me on the piazza and we have a little talk. Very few men know what they lose in not treating their dogs more like friends, and very often they are truer friends than humans. "Talking Podgers" for the pleasure I took in reading his letter, I remain yours truly, G. L. A.

ALWAYS BE POLITE.—A brave, active, intelligent Terrier, belonging to a lady, one day discovered a monkey belonging to an itinerant organ-grinder seated upon a bank within the grounds, and at once made a dash for him. The monkey, who was attired in jacket and hat, awaited the onset with such undisturbed tranquillity, that the dog balked within a few feet of him to reconnoitre. Both animals took a long steady stare at each other, but the dog evidently was recovering from his surprise, and about to make a spring for the intruder. At this critical juncture the monkey, who had remained perfectly quiet hitherto, raised his paw, and gracefully saluted by lifting his hat. The effect was magical; the dog's head and tail dropped, and he sneaked off and entered the house, refusing to leave it till he was satisfied that his polite but mysterious guest had departed. His whole demeanor showed plainly that he felt the monkey was something "uncanny," and not to be meddled with.—*Nature.*

DENIS.—Denis is an Irish water spaniel, and the property of A. O. F. Bruce, now of Criterion, Lake Megantic, Canada. Denis is by Patsy out of Nora, Patsy by Young Doctor out of Champion Bitch, now of Ontario, Yr. Ling Doctor by doctor out of Beauty, Nora by Grigilback's Pat out of Champion Duck, Pat by Boatwain out of Juno, Duck by Palling's Drake out of Lord Howth's Duck.

CZAR.—Pedigree of Czar, the property of Mr. F. A. Gage, of Fulton, N. Y.: Czar is an English cocker spaniel, liver and white, whelped May 17, 1878. Czar is from Flora and Sam, out of Caper and Captain, and Nellie and Captain, from Juliet and Romeo. The dog came from Mr. McKoon's well-known kennel in Franklin, N. Y.

NAMES CLAIMED.—*Franklin, N. Y., August 3.*—Mr. M. P. McKoon claims the name of Belle (formerly Lively) for his liver and white cocker spaniel bitch, out of S. B. Thorstein's Snip and Juliette, whelped November 20, 1875. Through an oversight she still retains the name of Lively on Mr. Bestor's record book, hence the above to rectify a possible error.

MR. E. S. WANNAKER claims the name of Fame for his red Irish setter bitch pup, by Elcho out of Rose, born April 6 at Centerville, N. J.

WHIRLS.—*St. Louis, July 23.*—The St. Louis Kennel Club Irish setter champion Biddy has whelped to Thorstein three dogs and four bitches. Irish setter Erin has whelped to Thorstein three dogs and two bitches.

Strathroy, July 23.—Mersey, Leicester-Dart, seven puppies, to Gladstone.

SALES.—Mr. H. C. Cornell has purchased from Mr. E. S. Wannaker his English setter dog Ripple; Pride of the Border-Jessie.

—Mr. G. H. Goodrich, of Toledo, Iowa, has recently made the following sale of the Dasa-Nellie litter: To McKoon Bros., Toledo, Iowa, two dogs; Wm. Whalin, Howard, Iowa, one dog; Stoner & Emmerling, Toledo, Iowa, one dog; J. S. Margerum, Washington, Pa., dog and bitch; C. M. Walker, Dubuque, Iowa, one dog; J. R. McClarkie, Toledo, Iowa, one dog; Geo. N. Beckwith, Pittsburgh, Pa., one dog. The black and tan dog advertised in *FOREST AND STREAM* is disposed of. G. H.

VISITS.—*Strathroy, July 23.*—Dart to Leicester; Mr. D. Bryson's Zephyr, Rake-Fanny, to Gladstone.

—Dr. William Jarvis, of Claremont, N. H., has placed in Mr. Wannamade hands for breaking his pair of red Irish setter pups, by Elcho, out of Rose, born April 5, 1878; Raleigh, dogs. Lorna, bitch.

YACHTING NEWS.

BROOKLYN YACHT CLUB.—At a special meeting of this club, held July 31, it was resolved to start on a cruise to the Eastward August 28. The rendezvous is to be Glen Cove. Commodore Lester Wallack spoke on the necessity of the club making a good display, and he hoped that all craft that could get away would join, while there was a probability of several yachts enrolled in other clubs joining in the cruise if invited. Authority to extend invitations was granted the commodore. The course laid out is to Black Rock, New London, Greenport and New Bedford.

NEW YORK YACHT CLUB.—Four yachts entered for the match of this club on the Harlem August 1, and sailed for the Harlem River challenge cup, presented by Mr. Dowling, one of the owners of *Emma D.* Course, from 104th street, East River, to stake-bait off Ward's Island; thence to Eighty-ninth street and return, four times around. Tide was ebb and the wind fresh from the southward. It was a free wind up to the first mark, which was rounded by *Emma D.* in the lead, *Mary D.* second. Dowling & Lull's boat was well handled by Ed. D. McLennan and his regular crew. Her only rival was *Mary D.*, the old-time *Comet*, built some twenty years ago by the famous Archie Smith. On the second round *Cora*, up to this time the last in the fleet, took third place, with *Joe Egan* astern. The wind in the meantime had come out puffly, accompanied by squalls and rain. On the third round *Mary D.*, when her chance of winning was fair, was struck by a squall and put on her beam ends without further notice. On the fourth round, and the race finished by *Emma D.* winning in 1h. 53m. 45s., corrected time, beating *Cora D.* 7m. 40s. The challenge cup goes to *Emma D.*, this being the second time she has won it. If successful once more the cup becomes her property, in accord with the deed of gift.

MATCH AMONG THE SMALL FRY.—Mr. J. M. Sawyer, of this city, in connection with what yacht owners, has been making arrangements for an open race for boats 23 to 26 feet in length. Entries \$100 each, first boat to take the entrance fee, second to save hers. *Mardiha M.* and *Vettie* were the only entries made up to August 2, but others are expected. Course to be same as that for New York Bay Regatta.

QUAKER CITY YACHT CLUB.—The ocean match of this club was sailed off Cape May, Del., July 27. Course from Denizor's Pier around lower buoy on Eph's Shoal, thence around the upper buoy on same shoal, rounding these buoys twice and return home, distance twenty miles. Entries: *L. Belle*, Captain W. E. following; *Stella*, Captain W. E. following; *M. E. Quay*, Captain Thomas Kloss; *Phantom*, Captain Charles Selme; *White Wing*, Captain Paul Klotz. They all crossed the line under plain sail, the two sloops of the first class having top-sails set. *L. Belle*, *Stella* and *Phantom* hoisted jib topsails on the run down to the buoy. The latter was rounded by *M. E. Quay* first, *Stella*, *L. Belle*, *White Wing* and *Phantom* following. The latter two went off to the northeast, having mistaken their sailing directions. On the stretch between the two buoys *L. Belle* overhauled the *Quay*, and *Stella* brought up the rear. There occurred another difference of opinion at this point as to the true course, for while the *Quay* went around the two buoys a second time, the other two yachts recalled the whole course. The *Quay* first changed her opinion, and followed the others around the whole course a second time. On rounding the lower buoy again, *L. Belle* led, *Quay* second, and *Stella* third. On the run home *Quay* parted her topsail halliards and doused the *L. Belle* crossed the line in 1h. 57m. 30s., *Stella* 1m. 33s. later, and *Quay* in 2h. 0m. 27s. *White Wing* and *Phantom* not timed. The match was sailed under the auspices of the following gentlemen: Judges—General J. T. Owen and Harry Jackson; referee, Mr. Magee, G. F. Agar and A. A. Hynehan; starter, John Hockley, Jr.

BOATED FOR THE LAKES.—It has been mooted that several yachts of the Brooklyn squadron will, after the termination of their cruise, make for the lake region via St. Lawrence River. Mr. W. H. Wood, a member of the Brooklyn club, is now in Detroit trying to arrange a series of matches with local yachts from Detroit to Cleveland, races to take place in September.

A MONSTER SAFELY DOCKED.—The beautiful Inman Line steamer, *City of Chester*, was successfully docked on Wednesday last, in the large sectional dock foot of Rutgers street. It was at first doubted whether any dock in New York could lift the big ship, but as it was absolutely necessary to replace her broken propeller with a spare one borrowed from the *Algeria*, the attempt had to be made. The *City of Chester* is the longest ship of the Inman Line, with the exception of the monster *City of Berlin*. She measures 476ft. over all, and displaces when fully loaded 3,500 tons. The steamer was docked at the foot of Rutgers street, and the hull towers high above the neighboring shipping. She has an extremely handsome model, her bows being almost those of a yacht in fineness and beauty. Her midship section is easy, with moderate "tumble home," and her run is remarkably clear. She represents a model in which there is a union of lines noticeable throughout the design, a greater degree than generally met with in ordinary Atlantic sailing ships. Like all vessels of the Inman Line, she is full ship-rigged, and is able under canvas as well as under steam. She will be delayed only a day or two by the docking, and will sail immediately for Liverpool in command of Capt. Brooks. Messrs. Dale & Inman deserve credit for the energetic manner in which they have had the vessel fitted again for duty.

THE PLAQUE OF BRITISH YACHTMEN. The inventive Yankee is a veritable nuisance to staid John Bull across the water. No sooner has he tumbled into the belt than he has reached perfection, when up starts some pestiferous Yankee and beats him out of sight, inflicting a rude awakening upon his phlegmatic constitution. The latest that has turned up to plague him is the catamaran. A veritable Herreshoff double-huller sailing around the British fleet, at the Royal London, on or off the wind, or as *Land and Water* has it:

"The Yankee nondescript twin sailing boat was out trying with the British, and went along as if she had a steam engine in her. She easily passed the racing boat on all points of sailing; but such a craft has no pretensions to be styled a yacht; she is a mere sailing machine."

ATLANTIC YACHT CLUB.—The annual cruise of the Atlantic Yacht Club of Brooklyn, set down for Aug. 3, brought together a fleet of eight yachts off Baylis Dock, opposite Whitestone, on the evening of that day. The *Triton*, Commodore Thayer, is the flagship for the occasion, and *Peerless* and *Vision*, with the sloops *Orion*, *Dolphin*, *Imperia*, *Intrepid* and *Nomad*, formed the fleet. *Thistle*, lately from Boston, also accompanied the squadron. In the forenoon a made sail for Glen Cove with a leading wind. *Thistle*, famous in Boston waters, but recently outmatched by the wind-jammer *Undine*, showed the good stuff she has in her, in spite of her defeat by the New York built sloop. She showed her stern to *Orion*, and as she is a weatherly craft likewise, there will be some close work ahead for Commodore Cooper's able *Orion*. The fleet made harbor with *vision* leading, *Thistle* second, *Orion* third, *Peerless*, *Dolphin*, *Imperia*, *Nomad* and *Vision* in the order named. A large accession to the fleet will be made at an early day, as the craft now cruising fall in with the flag-officer's command. *Lizette L.*, *Alma*, *Mela*, *Undine* and others are expected to join, and the fleet will probably number twenty sail by the time Greenport is reached. Thence the open regatta, already mentioned in our columns, will bring together a very large fleet of cabin yachts, and a spirited match is expected. On Sunday divine service was held aboard the flagship, the Rev. Dr. W. H. Thompson, chaplain of the club, officiating. New Haven, New London and Greenport is the order of the cruise as far as settled yet. At the latter port further instructions will be issued to the captain. The open cruise has been ordered under the most favorable auspices, and bids fair to maintain the high standard which this club has acquired for the zeal and drive its members put into the sport, and for the Corinthian character of the yacht owners sailing under the white and red.

BEVERLY YACHT CLUB.—The forty-first regatta of this club will be held off Coult, Mass., August 16. Open to all yachts under 35ft. on water line. Only one class. Prizes in money. Club time-allowance. Start flying. No restriction in regard to crew. Men allowed for 35ft. and under, three men for 31ft. to 35ft., four for 27ft. to 31ft., five for 24ft. to 27ft., six for 21ft. to 24ft., seven for 18ft. to 21ft., eight for 15ft. to 18ft., nine for 12ft. to 15ft., ten for 9ft. to 12ft., and eleven for 6ft. to 9ft., and under 30ft., seven men. No trimming by weights allowed. These last two rules accord so entirely with our own views concerning the proper limitations to be set upon crews and the abolition of sand-bags that we are glad to notice the strict enforcement of these rules by the Beverly Yacht Club, and only wish that the matches among open boats in metropolitan waters could be made by the same sportsmanlike spirit. Entries must be made by August 15 to Mr. John T. Coolidge, Cotuitport, Mass. Regatta Committee—Messrs. G. P. Gardner, J. G. Minot, J. T. Coolidge, G. P. Upham, Jr., and W. Lloyd Jeffries. Judges—J. T. Coolidge, A. L. Lowell, F. C. Lowell and G. Crocker. For the forty-second regatta of the same club, to be held the day following, there will be two classes, yachts over 35ft. and under 30ft., and yachts of 17ft. and under. Regatta Committee same as before. Judges—G. C. Lowell, G. P. Gardner and J. T. Coolidge. The yacht *Elise*, B. Y. C., will serve as judges' boat for the occasion.

BOBSTAY FALLS.—There seems to be considerable trouble among English cutters with parting their bobstay falls. Have they never tried reefing off wire? The *Muriel* has a flat-check block of iron at the end of her bobstay-rod, a single block at the bowsprit end, and a plate wire rope above through, the standing part being secured to the block at bowsprit end, then rove down through the lower block, back through the upper one and inboard to the winch.

SALE OF THE SLOOP ANNA.—Mr. Thomas Manning, yacht broker, 53 Beaver street, has sold to Boston parties the C. B. cabin sloop yacht *Anna*, 43ft. 6in. over all, built by Kirby in 1899. While lying the Atlantic Yacht Club burgee she won seven regattas and has never been beaten. She will be added to the fleet of the Eastern Y. C. Club, and the wire rope reaches Boston will go on a cruise with the *Wayward*, which has been chartered for the season. Mr. Manning has been appointed honorary agent of the Royal Canadian Yacht Club.

CHALLENGE TO JIB AND MAINSAILS.—Mr. Taylor, of Jersey City, will match the *Addie Taylor* against any 23ft. boat for \$250, or will take part in any sweepstake race for \$100 entrance fees.

LONG CRUISE.—The yacht *Okanetta*, of Cleveland, O., arrived at Charleston, S. C., July 31, via the Gulf of Florida.

OAR AND PADDLE.

RETURN OF THE SHOR-WAR-OAE-METTES.—The Monroe crew returned from their visit to Bournemouth, England, in the steamer *Ugboat* of Anchor Line. They arrived in New York, July 31, and were met by delegates from the Triton and Eureka clubs of Newark, who invited them to become their guests and be present at the coming regatta of the N. A. A. O. It is not probable that the invitation will be accepted, as the members of the crew desire to remain at home a while, and the distance from Michigan to Newark is too great. They will attend the coming regatta of the New York Yacht Association however. Concerning their visit to Henley, they say that, though well treated by the townspeople, they did not receive that attention or courtesy which was their due, and which would have been extended to English crews visiting us. But for the sickness of Mr. J. Nadeau, they feel confident they would have won. Mr. Lee, who returned in the same steamer, was given to Mr. Lee by Mr. Brockway of London, that he could enter for the championship race from Putney to Mortlake, and even went so far as to send his boat to the club-house of the London Rowing Club, and was only then informed that it had been decided not to allow visitors to enter. He repudiates the idea of the London press that he was used up, and says, very truly, that it is ridiculous to suppose he could not pull one or two strokes more when leading the race, but that he had been directly instructed to stop at the stump, and when he did so he was under the conviction that he had won the race. Moreover, when he passed the stump the flag was dropped. No explanation was given him of this doubtful proceeding. Moss himself considered Lee the winner, and Mr. Playford assured the American that he had an easy thing of it and was sure winner. Altogether, the action of the Henley Regatta Club, either a sad case of indiscretion and incapacity, or something much less excusable.

HANLON ROSS RACE.—After five postponements Hanlon finally met Ross at St. John, N. B., July 31, and the race terminated in an unsatisfactory manner. The water was smooth, and everything favorable to the match. In the morning Ross objected to row on account of the water not suiting

him and the starting buoy being out of line. Hanlon offered to give him two lengths start, but nothing could induce the St. John man to put. Sheriff Harding, the referee, then threw up his arms and went aloft from the judge's steamer. In the afternoon, however, Mr. Harding, being telegraphed for, consented to act, and steamed out into the bay on the judge's boat at a quarter to five. Both scullers soon put in their appearance, and a start was effected at 5h. 5m. For the first 20 yards neither seemed to gain. Ross was pulling 86 and Hanlon 39. Ross then got a slight lead and kept it for the first quarter of a mile; but Hanlon spurring caught him and at the half mile the two were even. Ross slowing down to 34 and the Toronto man to 31. At Appleby's Wharf, two-thirds of a mile, Hanlon led by half a length, pulling 30 against 33 of Ross. Both spurred vigorously, and by the time that the lead was spun out to a length Ross put on another spurt, when suddenly his oar jumped the patent rowlock and in an instant he was overboard and disappeared. When he came up the boat was rescued by the judge's boat. Ross claims that his boat got in bad condition soon after the start, and that he was watching it and not his opponent. The prevailing opinion seems to be, however, that he was overmached and would have been beaten anyway. From the mile mark, where the accident occurred, Hanlon took matters easy, and paddled over the course in 30m. 58s. And so the great sculler from Toronto has ended up another race. Gradually but surely the list of candidates for him to pull is being narrowed down to Courtney of Union Springs, and efforts are now being made to bring about a match between the two at Ottawa for a purse of \$5,000.

CANOEING IN OPEN WATER.—Mr. Editor: The canvas "Clochette," N. Y. C. G. (Shadow) and "Star" (Rob Roy), which left New York on July 6, cruising, and bound for Newport, by way of Long Island Sound, arrived safely and in good order at Newport on July 26, after making stops at several days at New Rochelle, Rye, Stamford, Sachems Head, New London, Watch Hill and Narragansett Pier. The weather and wind were all that could be desired between New York and New London, but between the latter place and Newport the canoes experienced heavy weather, still though favorable winds, and an ugly sea. While off Rocky Point, three miles west of Point Judith, on July 23, such a heavy sea was rolled by the wind, that the canoes were obliged to put for the shore and come in through high surf. No damage was done beyond a thorough wetting, the breaking of a paddle and some small spars. During the cruise the "Clochette" had an extra two-inch keel attached, which added greatly to her sailing powers. Under sail she was much faster than the "Star," but was no match for the latter with the paddle. L. F. O'G.

THE DORY NAUTILES.—The little dory *Nautilus* has safely arrived in European waters, and put in at Mount's Bay, Cornwall, England, Aug. 1. She left Beverly, Mass., June 12, making the passage in fifty days all told. With the exception of the fatigue occasioned by their cramped quarters and continuous duty at the helm, the brothers Andrews experienced no difficulties on the voyage which good seamanship and watchfulness could not cope with. They propose, after a short rest, to start for Havre. The crew complain only of the fatigue, due to the impossibility of obtaining undisturbed rest, their sleep being akin to stupor and but little refreshing. The dory is 19ft. over all, 15ft. on the bottom, and 27in. deep; carries a lug sail of 25 yds. duck; mast, 8ft. above deck, 8in. diameter; and the boat and rig weigh 500lbs. She was of the usual "dory" model, flat bottom, flaring sides, and raking stem and stern.

WOODSIDE ROWING CLUB.—The new boat-house of this club was appropriately opened for the use of the members, August 6, at Kearney on the Passaic. The house is 80x32 ft., two stories high, and built in Swiss style. The lower floor will accommodate a dozen club-boats and as many more private shells. A dressing-room is partitioned off, fitted up with lockers, bath and wash-stand. On the upper floor is the reception room, handsomely ceiled and finished in black walnut. Balconies surround the building, affording a fine view of the River Passaic. The house is 80x32 ft., 20x16 ft. The club is in a prosperous condition and owns six club-boats, besides the private property of the members. The officers are as follows: President, F. B. Littlejohn; Vice-President, E. W. Sadler; Secretary, F. M. Wheeler; Treasurer, E. N. Norton; Captain, J. H. Osborne; Lieutenant, F. M. Wheeler.

ROWING HIPPLES.

M. F. Davis, F. Plaisted, Evan Morris, and J. A. Kennedy have formed a new professional four on the Hudson, and have addressed a general challenge to the Boston crew, with whom they have deposited \$1,000. This means business. Their challenge is directed to Messrs. Faulkner, Rengan, McGeary and Hosmer, the Boston Four..... Woodside, of Kearney, N. J., are having a fine boat house built.....Ricketson and Mitchell scored three successive victories at New Bedford, Mass., July 20, and take the flags.....Tufts-Cove crew beat the Ross-Poley and Williams crews on Bedford Basin, Halifax, July 16, in a four-oared race, four-mile course.....Weisgerber and Felsinger will pull a three-mile race with turn, for \$600, at Wheeling, Va., Aug. 13.....Eric Railroad carries boats free and oarsmen at half fare to the national regatta at Newark; same on return trip.....O'Donnell, of Hope Club, New Orleans, and Croty, of Galveston, are likely to meet. Bet on Croty.....Union Rowing Association offer \$400 for four-oared race, "outs" of the trip. Will they have the same time in August. Big guns all expected to row.....Hosmer may get foul of Davis, of Portland.....Playford won the Wingfield Scull on the Thames, England, July 22. Fortunate for him that Lee, of Newark, was defeated; time, 24m. 19s.; Putney to Mortlake.

CANOEING IN THE BAY STATE.

PUTMAN, CONN., July 19, 1878.

EDITOR FOREST AND STREAM:

Perhaps some of the canoeists of the old Bay State who are beginning to look forward to the pleasure of a short summer cruise would have no objections to our pointing out a route over which we paddled a summer or two since, and one which includes the advantages of being near to the "Hub" and yet affording opportunities of camping, fishing and pleasant incidents that will repay the captain and all hands for the troubles and "outs" of the trip. We call on you to have the reader to the north of Mass. and, beginning to trace with the point of your pencil at the mouth of the Charles River follow its winding and devious course as far as the town of Natick, where you find yourself only three miles distant from Lake Cochituate. Follow the lake to its foot, where you approach the head of the Sudbury River and again you trace the course of this stream until you reach the Concord; and from thence into the Merrimac River, which you follow to

the city of Lowell, and you are back once more to within only twenty-six miles by rail from your starting point. Here you can either have your canoe and self transported back to the "Hub," or continue your trip to Lake Winnebago.

If the canoeist's leisure time is short he can make the cruise as far as Lowell by water in a week, including time spent in portages over dams and across the lake from the Charles; or, if more time be at his disposal, he can pass two or three weeks very pleasantly fishing and camping wherever inclination predisposes him. The canoe which carried us over this route was a Itob Roy of fourteen feet in length and two and one half in width, and supplied ample storage room for cooking utensils, rubber coat and blankets, fishing rod and all the "accidents" incidentally necessary to the cruise. It was a simple affair. We carried no tent, as it was our intention to sleep in the "cabin" at night, and the mast, with malsail and jib, when folded up, was about the size of an old-fashioned family umbrella. Canned corned beef and boiled chicken, coffee, sugar, potatoes and hard tack formed the requisite provender for the inner man, and with everything stowed away in good shape, and all hands happy over the strong easterly breeze blowing in our favor directly from the ocean, the Itob Roy left the dock at the Union Boat Club on the heels of Boston were striking the hour of seven one bright July morning in 187-. In quick succession we passed under the bridges that span the Charles River, past the Brighton slaughter house and Harvard's famous college, past farm and garden, meadow and woodland, and at noon reach our first portage at the town of Watertown, the dam there stopping the farther flow inland of tide water. Here we transport canoe and baggage, partake of a short lunch and halt not in our journey until just beyond Waltham, where, as night is approaching, we propose to make our resting place. On the edge of the woods close by the water's edge we land, draw the canoe on shore, light a fire, and shortly the strong odor of old Java unites with the incense of pickled fried brown and crisp, caught with a trolling spoon as we paddled along past the lily pads, and, with the addition of fried potatoes and hard tack, comprised a repast that full justice was done to. And here began the troubles of a coffee-put with a tale, as that necessary convenience parted with its spot by incautiously allowing too much heat to strike it from the stove-fire-place on which it rested. The following the covering was discovered, then followed in rotation the hinge of the cover, and finally the handle of the coffee pot, so that when the cruise was ended we hung upon a nail the battered and limber remains of a once useful utensil in "memento" of our experience. Sapper disposed of and dishes cleared away we open a box of cigars from the hold of the Itob Roy and, lazily reclining on the grass, with the blankets for a pillow and one of "Wilkie Collins" novels for perusal, we smoke and read away the time until darkness draws a mantle over the scene; and remembering the old adage, "early to bed and early to rise," we at once conveys in the clear quarters of the canoe and, with rubber blanket over the back-hole to keep out the damp air and moisture, we are lulled to sleep by the melodious bass notes of a huge bull-roarer executing a solo to admiring brethren from the top of a dead stump protruding near by from the water.

Shortly after daybreak we are astir, dispose of an early breakfast, and the Itob Roy is under way again. Passing numerous small towns, stopping here and there to fish, or idle away our time, trolling for pickerel or perch as we sail or paddle snug and, when inclination suggests, taking a bath, we reach Concord, where we anchor under a hanging ledge of rocks, or in the shadow of the woods that at portions of the route line the banks of the river. The end of the fifth day brings us to Natick, where our store of provisions is replenished and the sum of three dollars pays for transporting canoe and cargo to Lake Cochituate. Three days are passed on the lake, two of pleasure and one of discomfort, as a heavy rain-storm from morning until night made any attempt at enjoyment a decided failure. Passing by day and a half on the Sudbury River we continued onward to the Concord, exciting frequent and hearty greeting from the farm hands engaged in making hay, and the innumerable "small boy" who stand on the river's bank to see the strange craft invading the hitherto quiet stream. Into Concord River, past Concord, with its well-tiled surrounding farms and fruitland orchards, we pass on our way and are fully satisfied with our cruise, when the tall chimneys and brick buildings of Lowell, on the Merrimac, come to view, and our two-weeks' trip is at an end. The Itob Roy takes passage on a freight car to Boston and we are once again ready for business, hale, browned and hearty, and remember long the beauties and sport of living in the open air. BEST.

Sea and River Fishing.

FISH IN SEASON IN AUGUST.

FRESH WATER.	SALT WATER.
Trout, <i>Salmo fontinalis</i> .	Sea Bass, <i>Scorpena ocellatus</i> .
Salmon, <i>Salmo salar</i> .	Sheepshead, <i>Archosargus probato</i> .
Salmon Trout, <i>Salmo confinis</i> .	Striped Bass, <i>Rocky Mountain</i> .
Land-locked salmon, <i>Salmo gairdneri</i> .	White Perch, <i>Morone americana</i> .
Grayling, <i>Thymallus tricolor</i> .	Weakfish, <i>Cynoscion regalis</i> .
Black Bass, <i>Micropterus salmoides</i> .	Bluefish, <i>Pomatomus saltatrix</i> .
M. nigricans.	Spanish Mackerel, <i>Cybinus maculatus</i> .
Muskalonge, <i>Esox nubilus</i> .	Cero, <i>Cybinus regalis</i> .
Pike, <i>Esox lucius</i> .	Boito, <i>Sardinia pilchardus</i> .
Yellow Perch, <i>Perca flavescens</i> .	Kingfish, <i>Morone chrysops</i> .

FISH IN MARKET—RETAIL PRICES.—Bass, 20 cents; bluefish, 6; salmon, 25; mackerel, 15; weak fish, 10; Spanish mackerel, catfish, 30; green turtle, 10; halibut, 15; haddock, 6; king fish, 18; codfish, 6; black fish, 12; flounders, 10; porgie, 6; sea bass, 15; eels, 18; lobsters, 10; sheepshead, 18; frogs, 30; whitefish, 12½; Canada brook trout, 40; Long Island do, 31; pompano, salt water, 25; smoked salmon, 18; hard crabs, per 100, \$3; soft crabs per dozen, \$1.50.

Spanish mackerel have been taken in quantity on the New Jersey coast in the vicinity of Port Monmouth, selling at 80 cents; pompano, large catch in Chesapeake Bay; bluefish abundant on the coast from Canarsie east as far as Cape Cod.

MASSACHUSETTS.—Nantucket, Aug. 4.—Bluefish are very thick at present, and expect to have good sport for the next week or so. The largest catches are as follows: Gypsy, 107; Favorite, 77; Elor del mar, 63. Sea fishing is in its prime, one party bringing in thirty-five last Monday. The *Undine* caught a man-eater—the first of the season. While coming through Great Point Rip Friday, the *Vesta* spring her mast, and was damaged to the extent of \$100. JACK CUDWELL.

CONNECTICUT.—East Hampton, July 24.—East Hampton Lake, half a mile from the depot, is the resort of anglers. We spent an afternoon there the other day, from 1:30 to 6 o'clock, catching 14 black bass and two yellow perch. Used shiners, small bluefish and roach. The island in the lake is a favorite camping ground. H. C.

RHODE ISLAND.—Pasque Island Club, August 2.—Two more large bass were taken here last week, one 50½ pounds by Mr. Thomas E. Tripler, and the other 34½ pounds by Mr. A. B. Dunlap. F. O. H.

NEW JERSEY.—Kinney's Ashley House, Barnegat Inlet, Aug. 3.—Unprecedented success among the sheepshead and blackfish. As high as 310 pounds of sheepshead taken in one day; with one pair of hands 197 taken in one day; they run larger than heretofore taken. Blackfish weighing from 3 to 5 pounds taken off the different reefs. The following are some of the scores: O. S. Bilyan, T. S. Dando and G. G. Sill, Philadelphia, 67 weakfish, 76 blackfish, 1 sheepshead off the mediator; Howard, Middleton & Co., Philadelphia, 71 barb; G. T. Mills, 43 barb; Geo. Birdsal, Philadelphia, 34 barb; G. P. Snowden, N. Y., 27 sheepshead; same day 107 taken by all the other boats. Not less than 150 taken per day on the 1st, 1st and 2d. Bluefish—the 1st a dead specimen, Messrs. Cartledge, Westcott & Co. scored 32 on the 2d. They run about 2 pounds, and were caught in the inlet immediately opposite the house.

FISH PESTILENCE IN ILLINOIS.—Mr. Editor: A destructive epidemic is raging among the fish of Rock River, Illinois, and one of its tributaries, the Peconic. It was noticed on the 20th that hundreds of dead fish were floating on the surface of the water. Thousands of them drifted to the shore and lay in heaps upon the flats. They are of all sizes. A surgeon stranded near Rockford that measured eight feet, and weighed 100 pounds. It is noticed that no bass, pickerel or game fish are taken from all parts of the country, and being well stocked with black bass, afford much sport to anglers. Charles Zimmerman, of St. Paul, and friends, have been taking them with a fly. II.

AN OFFICE BOY ON HIS TRAVELS.—The following, from one of the FOREST AND STREAM office boys, is characterized by brevity and pith:

COAST OF MAINE, Aug. 2, 1878.

DEAR FOREST AND STREAM:
I had a good passage to Portland via Maine Steamship Company's line and can well recommend the route for a short summer voyage to get a good sail of the ocean and a little sea sickness. We are camped out on Hog Island and have named it "Camp Lookout." All well and feeling good. More anon. THAD.

BLACK BASS.

THIRD PAPER.

It is good luck to any man to keep on the good side of the man who knoweth fish.—Complete Angler.

IT would perhaps be well to notice some errors concerning black bass before we enter the last and deep mysteries of black bass fishing. There is no subject on which so little is known as upon this, and yet thousands will tell you that they understand it very well indeed. I notice in FOREST AND STREAM that many Florida correspondents speak in glowing terms of the "black bass" they have caught in Florida waters. Now, I deliberately and solemnly deny that there ever was a black bass found in Florida, or, indeed, in the waters of any Southern State, except they have been introduced by human agency. I make this *bona fide* offer to any of the correspondents of whom I have spoken, that if he can find a black bass in Florida—caught there—a native of Florida waters, I will send him a fifty-dollar bill, and on his failure to do so he is to send me the like sum. The fish to be sent to any scientific man or men for examination.

There is a fish in Florida—a congener of the black bass—which looks somewhat like a musky; but he is no more a black bass than a negro is a white man. These fish are found in all southern waters, and they are known from Virginia to Texas as "trout," yet they are less like trout than they are like black bass. They are bold biters, but they soon tire, having none of the game qualities of the black bass; nor are they near so fine a fish for the table, their flesh being coarse, and in many instances giving forth a peculiar musky odor. I bring this in to show you that the fish which you attain to the weight of twelve or even fifteen pounds, a black bass that weighs ten pounds is considered an exceptionally large fish. Longitudinal bars mark the trout, giving it a very pleasing appearance. In many localities in Virginia and North Carolina these fish are called "chub." Why, is a mystery, for they don't look like a chub; and, indeed, in some parts of Georgia they are called "chub" or "chubfish." The perch is called a chub. Why, is another mystery, for the "waymouth" perch is first cousin to the rock bass. And I know no fish that looks less like a rock bass than a chub; yet the rock bass has found in some southern waters—only in Georgia, and only in three streams emptying into the Flint River, and in some emptying into the Coosa.

But our southern fish which is usually called a trout nor a bass—when sold we are told, is often caught in Kentucky and Missouri while fishing for bass. He is there called "green bass" on account of his color. Neither a bass nor a trout, like Mahomet's coffin, between heaven and earth he remains suspended until he shall have been taken down and placed in his proper scientific niche.

But, *recens unus a veris bassis*. Go with me some still, calm evening in June, to the White Sulphur Springs, in Indiana. The gentle current sweeps light, and murmuring at every obstruction, piling masses of foam and yellow blossoms against every overhanging bough. Mark well those places, for under them lurk some black bass that will try your rod, your line, your temper and your skill. Sit down here while I cut away those vines loaded down with yellow

Blossoms—while I part the boughs of this noble sycamore, just putting on its summer liver of green leaves. Now drop your line, with one single buckshot on it, about a yard above the foam; it will float down under it, where the black and yellow beauties lie. Was that the current which gave the line that tug? "No, by St. Bride of Baitwell—no!" It is a veritable six-pounder! See how gallantly he dashes down the river and spins out fifty yards of line, and then leaps high in air, mouth wide open, fins extended and a general air of determination to get rid of the hook at all hazards! Depress the end of your rod now and the real work of capturing a six pound bass with a nine ounce rod commences. Stand a little higher up the stream and you can see the fish, which he is now turning. Give him the butt! The good, tangy rod bends until you can touch the tip with your hand. You hear the timber creak and groan, but it holds, for it was made by an honest man and an honest maker (Conroy), who stands no chance of being beaten by, or with, rods! Now let him run at his own sweet will—and he will be sure to do it. Round and round, in constantly decreasing circles, until, all pained exhausted, he is lifted up the bank—a full grown specimen of

And yet, all the youthful fire is not gone out of the old man. As I recall all the exciting sports of my youth and boyhood, I am tempted to say: "Would I were young again." But age has its hallowed pleasures, to which all other periods are strangers—the fond pleasure of a genial retrospection. To have merely lived, that is not enough. If we have not done some good in our "day and generation" then indeed must our lives be called miserable failures. That the few lines we have written may induce some half dead dyspeptic to try his hand at "bass fishing" were reward enough; to know that genial sportsmen and accomplished gentlemen have read them with pleasure were a still higher reward; but the highest of all, the knowledge that what I have written has been a solace and a pleasure to my own jaded and wearied mind.

Soon, I promise you some articles on "Southern Angling," *Lavinton, Ga.* ST. CLAIR.

The black bass of the North is *Micropterus nigricans*, that of the South *M. salmoides*, and the question of the relationship is very fully discussed in the "Sportsman's Gazetteer," which contains the latest information on the subject. The differences between them consist mainly in the size and arrangement of the scales and the bones of the head, and in the number of the dorsal, pectoral and anal fin rays. There are also differences of habit, the Northern bass preferring running waters while the Southern delights in stretches of still water, such as the mill ponds and quiet bayous of the Southern States afford. There are many variations from these two types, and it is as yet difficult to say whether some of these varying forms are not entitled to be regarded as permanent varieties, or whether individual variation will account for all differences. As stated in the "Gazetteer," "The differences of the two primary forms are, however, perfectly appreciable, so that even the veriest tyro, seeing them side by side, must admit their distinction."

The fish of which our friend St. Clair writes is of course *M. salmoides*, which may be called "the cousin german of the black bass proper."

THE STRIPED BASS IN TEXAS.

HOUSTON, Texas, July 9, 1878.

EDITOR FOREST AND STREAM:

Your correspondent, St. Clair, in his article on bass fishing in FOREST AND STREAM of the 4th states that the striped bass is not found anywhere in the West except Missouri and Arkansas. If Texas is a Western State, then he is mistaken in his statement, or I am mistaken in a fish. For some time past we have had in our market a fish which exactly resembles the fish described by St. Clair as the striped bass, and the fishermen here call it by that name. The only difference that I can see is, that as we have it here it rarely reaches a pound or even weighing several pounds. It is caught in the San Jacinto River and other streams flowing into Galveston Bay. It is a most excellent little fish for the table, and the fishermen tell me that for his size he is remarkably game. I have noticed them for the first time this season, but the fishermen say they are plentiful in the river. I intend to go out to that river in a few days and try them on.

It was for some time perplexed to know where to place this fish ichthyologically, and I may be mistaken in it yet. I at first thought they might be the young of the *Roccus lineatus*, or sea bass, but I never heard of that fish in Texas, and my opportunity has been a pretty good one to become acquainted with our coast fishes. Then I concluded that it must be the *Labrose lineatus*, but Mr. Hallock does not credit us with the possession of that fish. It is very evident that it is St. Clair's striped bass, whatever that may be.

And while on this subject of bass, "which I wish to remark," is this: I have seen nothing in any of the books which properly describes the bass of Western Texas, or the fish commonly known there as the trout. He is very unlike our black bass here. The latter is of a dark greenish color, with a distinct dark line along his flanks; his shoulders are very heavy, and he has a most monstrous and ungainly mouth. He is a furious fighter when hooked. A few days ago I caught one in Eagle Lake, sixty miles west of Houston, weighing 3½ pounds, which fought with such desperation that I thought for a while I had hooked a wild horse. They are sometimes caught weighing 10 or 12 pounds. They are never seen in brooks or shallow water, but stay altogether in deep and still water. The bass of Western Texas are longer, slimmer, of a light color, with no line on the flanks, and have no such shoulders or prodigious mouths. They rarely reach 4 pounds weight. They are very game, but not at all equal in that respect to the terrific hump-shouldered "cusses" we have here. Though inhabiting mainly still water, they are never seen by hunters except in mud brooks, where the water was not more than five or six inches deep. Coming upon them in such sports, they dart like lightning toward the deep water, jumping clear out of the water over one another in their haste to get away. Every brook in Western Texas, in the hilly regions, is filled with them. Indeed this bass is a highland or mountain bass, while our black bass belongs strictly to the lowlands. At least I have never seen the West Texas bass in the lowlands,

or our black bass in the highlands. I believe the West Texas bass is the true *Salmo fontinalis* in everything except his scales and spots.

Is this West Texas bass been described in the books, and if so, what is his name? N. A. T.

We have doubts whether our correspondent is exactly right as to the fish being the *Roccus lineatus*. The Fish Commission is not informed that *R. lineatus* ranges in the Mississippi Valley. At the Smithsonian there is a single specimen from the Gulf, taken at Pensacola. This is the only case of its occurring below the St. John's River. Perhaps the fish may be the *R. chrysops*.

SHOULD FISH BE KILLED AS THEY ARE CAUGHT?

BROOKLYN, N. Y., July 27, 1878.

EDITOR FOREST AND STREAM:

In your journal, May 16, 1878, page 283, you publish a communication on this important subject from Charles Roedel. You supplement his advice on the question with a strong and characteristic article advising each angler as each fish is caught, either to knock it on the head or to throw it over the head "on a stone or the thwart of the boat," or what you say is more genteel and to the point, pierce the cervical column at the "base of the brain with a sharp knife." You say further, "This produces paralysis, or almost immediate death." The postulate with which you commence your interesting article, viz.: "Fish will keep twice as long by being killed by a blow on the head directly after being caught than if left to die a natural death," is, we think, with due respect to your larger experience, rather a proposition needing proof.

We have faithfully tested the matter for ourselves and find your postulate an *ignis fatuus*. Those fishes which we have knocked on the head begin to decay long before those which we have left to die a natural death, and the decay begins first at the bruise. But, further, is it possible to kill a fish by knocking it on the head, or by the knives, as proposed, *id est instantler*, so much so as to become to a humane action? I reply to this question, which I raise with hesitation and all the respect for your experience in these matters, by stating the following facts—nothing but facts will serve at this stage of the argument:

Two or three years ago I spent many days with that noted and most skillful fisherman, the late Republican candidate for Mayor of the City of Perth Amboy, that city just one day older than New York City. Hon. Isaac C. Acken. Every day I accompanied him in his fishing excursions about Perth Amboy bay for nearly a year. He had a very good boat, and he had served for, say twenty minutes, he would up anchor and start for home. As fast as we caught our fish we placed them in a car, thus keeping them alive. If the time was just before dinner, I would take the oars and he would seize his knife and proceed to prepare some of the weakfish for dinner. Many times I have witnessed the following, and I make the statement without fear of contradiction, for Isaac C. Acken's word will not be doubted by any one who knows him, and he is my witness to prove my statement:

After the head of a weakfish had been cut off, and entrails taken out, taken alive from the car, and killed in cleaning for dinner, I have seen the fish actually jump off the seat of the boat and continue hopping about on the boat's bottom. Further, I have seen the cook of our homestead bring a codfish to the table, which she had just killed, and she had just killed and cleaned, and just as she was going to put it in the pot, it actually leaped from the table to the kitchen floor. Like all good and faithful cooks, she uttered a nice little scream and said: "Why, really, that fish ain't dead yet!" I now propose to show that a fish suffers no pain whatever as soon as it is out of the water. I own, at the start, that I cannot show it nearly so clearly as I can by induction. Two one asked to believe unless convinced. "If so be the ship's gone down, she's gone down; if so be the ship's afloat, she's afloat," etc., etc. The hypothesis upon which this showing must rest is as follows, to wit:

Place a man in a room filled with pure oxygen gas, and his life will be short but ecstatic. He will live a lovely life of exquisite happiness in a very short time. He will literally die in ecstasy. Man, in his common air to pure oxygen presents the ratio of a fish from water to common air. The very jumping of the fish is, therefore, by induction, an exhibit of ecstasy, not pain. It is proper to conclude by adding, we faithfully and devotedly believe that the Creator has wisely and with Godlike skill appointed it so that fish should die a death of pleasure when wanted for the sustenance of man.

C. HATCH SMITH.

The question of the fish having no feeling when out of water is only hypothetical. That different organisms have different perceptions of pain is, however, true. When fish jump out of the frying-pan into the fire, it is automatic, and certainly there is no sense of pain. It is, no doubt, true, as our correspondent writes us, that a bruise in an animal is the first place where decomposition takes place. If a knife is used, and the spinal column be touched, instant death occurs, without bruise of course. An excellent way to kill a fish is to take the head, and with the thumb and fingers move it to the right or left, and so the vertebral column at the base of the head is severed. The oxygen theory, however, of fish enjoying themselves when taken out of water into the air we do not agree with. A fresh mackerel on a gravel bank has very little appearance of being happy.

—The Pennsylvania R. R. Company, with its vast and continuous branches, is the best route to take for the great West. We can assure our readers that all dogs intended for the St. Paul Bench Show will receive the best attention, and on as good terms as by any other line. Officers and superintendents of the road are selected with special care as to efficiency, and travelers are forwarded with comfort and dispatch. The ride over the Alleghany Mountains is one of the grandest as to scenery in the world.

—We have seen several very elegant specimens of penmanship—both curious and ornamental—executed by Mr. Charles Gonzalez, of this city. With a pen this gentleman reproduces articles copied from the FOREST AND STREAM so plain and so singularly uniform as to give his work the appearance of original print. It is not only the lettering which is perfect, but the chaste and elegant scroll work around his designs that stamps him as an artist of rare ability.

National Pastimes.

NEW YORK ATHLETIC CLUB.—The ninth annual fall games and third annual competition for the amateur championships of America will take place at the club grounds, Mott Haven, October 12. The club also give notice that the second annual one mile swimming race for the amateur championship of the United States will take place on the Harlem River on Saturday, August 17, at 5 o'clock p. m. The swimming course will be between the Railroad Bridge and Macombs Dam Bridge. Entrance for the swimming race (entrance fee \$1) will close on Tuesday, August 13, at the club post office box, No. 3, 101.

SCOTTISH AMERICAN ATHLETIC CLUB.—The club will hold a series of open games at their grounds on West Fifty-fourth street, August 10, at 5.30 p. m.

ARCHERY.—Following is the score of the regular weekly meeting of the "Orlando Archers," Hackensack, N. J., July 27. The target used is 24in. in diameter, with gold, red, blue, black and white rings, 5in. in diameter. Scale of points: Gold (bull's-eye), 9; red, 7; blue, 5; black, 3; white (outer), 1. Distance, 30 yds, 7 in.:

Game Bag and Gun.

GAME IN SEASON FOR AUGUST.

Woodcock, *Philohela minor*. Red-backed snipe, or ox-bird, *Tringa americana*. Black-bellied plover, ox-eye, *Squatarola leucella*. Great marbled godwit, or marlin, *Limosa fedoa*. Ring plover, *Lygospiza semipalmata*. Willet, *Tringa semipalmata*. Silt, or long-shanks, *Himantopus nigricollis*. Tattler, *Totanus melanoleucus*. Miss L. Zingman..... Yellow-shanks, *Totanus flavipes*. Hebert's snipe, or dowitcher, *Megascopus asio*. Macrorhamphus griseus.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf-bird, phalaropes, avocets, etc., coming under the group *Limacola* or Shore Birds. Many States permit prairie fowl (pinnated grouse) shooting after August 15.

MASSACHUSETTS.—*Nantucket*, Aug. 4.—Black ducks continue to arrive in great numbers. Birds are also coming in in great numbers, and our ponds are so full that they have no place to feed. JACK CURELAW.

CONNECTICUT.—*East Hampton*, July 29.—Shooting prospects in this vicinity are very good. Quail plenty. H. C.

NARRAGANSETT GUN CLUB.—The Narragansett Gun Club elected the following officers for the ensuing year: Pres., James Gordon Bennett; Treas., Frank B. Ponter; Sec., S. Howland Robbins; Governing Committee.—James Gordon Bennett, Frank B. Ponter, S. Howland Robbins, Travis Van Buren, John G. Heckscher, Martin Van Buren, Carroll Livingston and Perry Belmont; Committee on Birds.—S. Howland Robbins, Carroll Livingston and Travis C. Van Buren.

ADIRONDACKS.—*Martin's Saranac*, July 31.—The usual rush here and to surrounding points has not commenced yet, and I do not think will. "Disregard to game laws has rendered this region less attractive to the sportsmen. Another infringement on the region has just taken place—a steamer has commenced running on the lower lake. I find booked here, Mr. Clegg, of New York City. Mr. Wood, of Brooklyn; Mr. Brandy, New York. Yesterday, Dr. W. W. Ely and Mrs. J. S. Ely, of Rochester, N. Y.; Dr. and Mrs. J. L. Romeyn, E. K. Romeyn, of Keeseville, N. Y., and Miss Babcock, Brooklyn, N. Y., passed through here en route to Bartlett's. A grand hunt took place a day or two ago, but the two deer driven in the lake by the boat escaped. The State law forbids killing deer until Sept. 1. Here they make the law to read Aug. 1, and overlook the fact that the law forbids hunting with dogs at all. We need State Fish Commissioners to prosecute every offender, and not until then can we save the deer and trout from being unmercifully slaughtered. S.

A CAT CHASE BEFORE BREAKFAST.—"Val" writes from Columbia, Tenn., of what must be lively fun:

"Do not think that I have reference to a moonlight chase in nether garments after the feline that discourses sweet music from back fence and convenient sheds. The cat in question is her more retired brother, the wild-cat. Daylight found our party of three mounted on bery mules and at the haunt of the cat. We soon surrounded the catnapper and put the cat to flight. A few minutes of silence ensued, and then time each rider kept an eye on his mule's ear to tell when he was going to buck. We were soon relieved of our suspense by the bay of the leader, and we knew 'the cat was thar.' It took some time to drive him out of the brake, but finally we succeeded in ousting him, when he made for the swamp, but was headed off by a gallant charge from 'Tom D.' He then took to the woods, hard pursued by the dogs. After half an hour's run he was tired and brought down by a ball from Uncle John's trusty rifle, and his skin now adorns the sanctum of your humble servant. After the cat was bagged we returned to Uncle John's to breakfast, about sunrise. VAL."

ILLINOIS.—*Charleston*, July 31.—Squirrel hunting is tolerably good around here this summer. Some very good bags made, the best by Freeman Biggs, the old squirrel hunter, and the best in the State. There has been a fine doe seen galloping over the prairie, near the three groves. It is believed that she has a fawn in there. The underbrush is very thick. The unmerciful pothunter is making a terrible slaughter of the pinnated grouse. J. B. D.

Freeport, Illinois, has a newly-organized "Freeport Shooting Club," whose object is the protection of game and glass ball practice. The officers are: President, L. Z. Farwell; Vice-President, Dr. W. H. Mills; Secretary, E. B. Hall; Treasurer, J. H. Stansbury; Executive Committee, President, Farwell, Vice-President, Mills, Jesse Burdard, E. Y. Hall and Charles D. Knowlton.

Wisconsin—*Alerton, August 1.*—If any of our people should come West this season, they will do well to take in Lake Koshkonong and the canvas-backs. At the present time snipe and woodcock shooting is good. The engineer of the steamer, Joe Mackree, with a friend, bagged 33 woodcock Tuesday afternoon last, and not content with that, he bagged six more before breakfast the next morning. Summer ducks are quite plenty now, but the season is not yet open for them. Prairie chickens will be quite plenty, though it was feared the early rains would drive them out. Now is the best time to get the chickens, early that the chickens are on high ground, and are consequently safe. A little steamer has been placed on Rock River and proves of great convenience to sportsmen, who are thus enabled to have quick communication with the sporting grounds. S. M. E.

CALIFORNIA—*Full Brook, San Diego Co., July 10-1*, and very pleasantly located in a lovely little valley of live oak etc., in a very wild country, with plenty of game around. The deer have not yet come down from the high mountains but soon will be here. I have shot three, however, since the deer are not so numerous as there are in the mountains. I have secured per deer for good sport. The quantity of quail within a circle of a mile from where I am writing is truly astounding, but I shall not bother them until winter. There is also fine duck shooting within a few miles in winter. Here are also many other places. It is a different country in every respect from any I have ever seen. The climate is just what I need. The soil is as delightful as one could wish and not half as hot as one would expect of this latitude.

T. S. VAN DYKE.

A BOY, AN AX AND A BEAR—*Mr. Editor*—While a
Aiken a few days ago I saw the foot of a large black bear
that was killed within a few miles of that high and dry town.
It is common to find them on the Edisto, fifteen miles from
the town, but very uncommon to find one so far from his old
haunts. The discovery of the old fellow caused quite an
amusing incident. Mr. Daniel Cook, a respectable farmer
living five miles from Aiken, had sent a colored boy to look
up a very gentle old black ox named Buck. In about an
hour the boy returned with the animal, and a lumbering
lumbering sound, a heavy cloud of dust and a black streak
coming with lightning speed right for his house. This some-
what alarmed Mr. Cook, not being accustomed to such sights
and sounds, and he at once concluded that it must certainly
be the eclipse of the sun coming ahead of time. On it came
right for the house by the front gate, and over a ten-foot fence
clear right into his house lot, where it came to a sudden halt
and stood looking at Mr. Cook. He cautiously approached it
lot and to his amazement and old Bessie's surprise, the lit-
tle key all in a pile, and the boy apparently in his last gasp, with
both hands completely tied up in the hair of Buck's tail. Mr.
Cook called for help and soon extricated the boy, took him
into the yard under a shade, and after using a bottle of cam-
phor and rubbing an hour, the little fellow opened his eyes
and said in a low whisper, "Bar! bar! bar!" and he was
then soon able to give a rational account of his troubles.
The old black buck had him by the tail, driving him
through the beard of the old fellow, and all the while he
reared up on his hind feet and fotch a snort, and bar! he
big bar in tree feet ob. Buck break for de house. I faint
and when I come to Mars. Daniel been rubbin' me in de fac
wid camphine." Mr. Cook alarmed the neighbors, collected
all the dogs and guns he could, and they were soon in hot
pursuit of old bruin, and after an exciting chase of half an
hour and thirteen shots, the old fellow felt a victim in his
foolishness in leaving his old range. Weight, 281 lbs. (Gone
from the bear, the boy and the little boys cried, "Go up
toun Bald-head"—En. l.)

While in Aiken we attended a meeting of the Goddard Shooting Club, and saw some good shooting at glass balls. Probate Judge Williams, of Aiken County, is the Bogardus of the club.

ONE OF THE GANG.

Williston, S. O., July 8, 1878.

A. VIRGINIA BEAR HUNT.—*Big Spring, Va., July 21*—*Mr. J. C. Hays* had been on a bear hunt in the Fort Lewis Mountains, which are three miles from this place. He made several trips in the mountains, and have had fair sport among the birds, but had never been successful in encountering my desired game until the 12th of July, when I fell in with Bruin. I started early on the 11th, taking with me a colored servant and two good bear dogs, and provisions sufficient for two days. After a hard tramp over the mountain we camped for the night; were up by sunrise next morning. Early in the forenoon we started on our hunt. For the rest of the morning without any success. When our dogs passed down into a deep ravine, struck the trail. On coming up to the dogs with the utmost caution, I beheld Bruin at the foot of a tree, snapping and growling at the dogs. Taking steady aim with my rifle, I pulled the trigger; the ball striking too low, and not taking much effect, only served to increase the excitement and fury of the brute. Catching sight of me, he layed back his ears and opening his mouth, with a snort that would have sounded very strange to me, if it had not been between us. Fortunately the dogs fell suddenly on his rear, with a fury which completely diverted his attention. Dropping my gun I ascended the tree, from which I watched the fight below. It lasted some minutes, one of the dogs springing badly hurt from a blow of his paw. The bear suddenly beat a retreat down a slope, followed by one of his tormentors. I descended the tree and looked round for my servant, who was nowhere to be found. Picking up my gun and placing a cartridge in it, I started with all speed, and soon met him as he continually turned to drive back the dog. Placing the rifle to my shoulder I fired, the ball hitting in the right shoulder. It wounded him badly, and roused him to a picture of fury almost impossible to describe. The roar he gave when the ball struck him I shall never forget. It so scared me that I almost dropped my gun. He bounded toward me with a speed one would hardly believe the unwieldy brute capable of. He came within five feet of my left hand, cutting my hand as he getting it out in the hunt. He then gave a snort, and for the attack, which did not take half the time it takes me to write this. He reared on his hind legs, and as quickly as possible I placed three bullets in his chest, when he fell off a heap in front of me. In his dying struggles he continually tried to grab hold of the dog, who still continued to attack him. I now proceeded to look for my servant. After wandering about the woods I discovered him up a tree, half dead, and death staring him in the face, with his hands returned late that night. The next morning he took on trophy home. He was in pretty good condition, weighing 436 pounds.

NOTES OF WESTERN TRAVEL.—Our readers will be glad to learn that the party convoyed by Texas Jack are now well

under way. The following letter is from Rawlins, Wyoming, under date of July 26 :

N. Y. Editor The 16th of this month we left New York City by train for Chicago, where we had for two days a job time with our friends. After Jack had joined us there, I started for Omaha, to stop there twenty-four hours. I think this is a very good place to purchase saddles; we bought a handsome and comfortable one for \$35 apiece, having a kind of choice from. Here we made our usual visit to the saloon to get a drink. Then we went to the station, our destination, intending to save money, as we had about 200 pounds over-weight. After many introductions to reporters and Jack's numerous friends at almost every station, we found ourselves at the Railroad Hotel, which was so crowded on account of the eclipse that, although we telegraphed for rooms, we there were put up in one little room like herring. A good night's rest made us rise early; we were anxious to get ready for our trip. It was possible to get a pair of saddles and some of the available horse or ponies were very scarce. After two days of search we bought seven ponies, four for pack and three for saddle, at the rate of \$45 apiece. Our second guide, whom we hired for \$2 a day, had his own pony and outfit. The usual price for ponies such as we got is \$35 to \$40, but they say that this season the price is higher than it used to be. Our outfit, consisting of pack saddles, tent, blankets, provisions, ammunition, etc., we purchased at moderate prices. We had a good outfit for a party of four, and for a trip, even rifle cartridges for any kind of rifle and any calibre. Our first trip will be south of U. P. R. R., near the border of North Park of Colorado, to Battle Creek and Battle Lake, about 65 miles from here.

The auspicious fishing and hunting both seem to be first rate. Everybody here speaks with great enthusiasm of the abundance of trout in the above-mentioned stream and lake. They say that they bite at a bare hook, but that they saw only one fishing with a fly. The trout are large, fat and plump, and are said to be just as plump as there are trout waters. What is true of this we will soon find out ourselves. This first trip will not extend longer than about three weeks as we made an appointment with Mr. Story, from Chicago, gentleman whom I got acquainted with at A. P. Jones' hospitable retreat at Homosassa, Fla., and another gentleman from Chicago, to leave for the latter place on the 10th of August. The second trip very likely will be none to Wind River Mountains. The last three days we had thunder storm, which cleared the weather, so that we may have it fair for the first week or so. My friend Frank is a very good sports and humor, and cannot await the time to kill his first deer; so is Jack, who is now engaged in packing, and who is sure to have some good things happen to him to-morrow morning. You will shortly hear from us in the field.

MONK ADO. WILD RICE.—*Mr. Editor*: I wish to write through the FOREST and STREAM to all who are writing terms regard to wild (or Indian) rice, that I am not in the business of gathering it; that the article in the FOREST and STREAM of July 4, page 430, was not an advertisement, but, through out suggestions as to the manner of gathering it, in order to secure its germination by parties who are at the trouble to get the seed and desirous of introducing this desirable wild-for attracting food. I will refer those wishing to get the seed what is said in that communication. I still doubt if it will grow after being sown in second year, but may be so. I have been getting it, and sending it any distance. I wish parties who have gathered the seed and been successful in making it grow would post up the "boys" how long before sown, whether dried, how far carried, etc. I would suggest to parties who order the seed to tell in what manner to send it; whether in sacks, green; in sacks, damp; boxes, dry, or seed damp in boxes or kegs, in water. I have received so many inquiries and applications for the seed that I have got the promise from parties to gather some. They cannot fix the price, never having gathered any. I will sell the seed as cheap as I can. It is ordered, probably \$3 to \$5 per bushel. After this year's price can be fixed, but now no one here has any idea what it's worth to gather it. No more will be charged than it costs to grow and ship. It must go by express. I will not advise over half-bushel in one package. If more is desired, put up in different ways. I will see to the putting up and send in the best manner, or as ordered, as soon as the seed is gathered, so that it can be sown in the shortest time. Parties who order must be responsible, or send the money with their order. It will be paid about the middle of September before it will reach the parties, and I will not be responsible for it. I will be glad in something to give pleasure to sportsmen. Let the sufficient answer to all interested.

W. B. RANSOM.
St. Joseph, Mich., August 1.

[illegible][illegible]

HO! FOR BRIGHTON BEACH!—On Tuesday another new route to the Atlantic beach was opened. Nearly five hundred persons embarked on the Pullman cars at the Long Island City depot of the Long Island Railroad for Brighton Beach. Time to be occupied from the foot of Thirty-fourth street to Brighton Beach will be some 45 minutes. The new feature of this road, which is most important for some of the 500,000 people who swelter in New York and Brooklyn during the summer heats, is that Brooklynites can take the elegant cars of the road at Flatbush avenue and go straight to Brighton Beach. The trains leave every 20 minutes up to 4 p. m. from Flatbush-avenue, and after that every 15 minutes. Tens of thousands of people will avail themselves of this new route. On the 6th, Messrs. Breslin & Sweet, of the Brighton Beach Hotel, did the honors at a sumptuous meal, was presented with a check for \$100,000. The rapidity with which the island has been converted into a famous place of summer resort is marvelous, and the Brighton Hotel, with its special roads, will be sure to be the favorite house of resort. Our thanks are due to Colonel Sharp, of the Long Island Road, for attention.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

W. R. K., Lebanon, O.—For an answer to your inquiries see last week's paper.

F. M. N., Silver City, Idaho.—The sage hen and the pinnated grouse are two entirely distinct birds.

J. A. B., Crawford, N. J.—Very good shooting for boys who had never tried their hands at it before.

R. P. B., Louisville, Ky.—Write to Secretary Narragansett Gun Club, Newport, R. I. Send us your scores.

H. L., Versailles, Mo.—You will find Bond's portable boat quite handy in Florida waters. Take a small sail along.

G. K. J., Richmond, Va.—Use solution of bromine or iodine. Gum myrrh mixed with olive oil gives great relief.

J. H. B., O. C. R. R.—Having carefully read your letter we think the rifle you mention best would suit your purpose.

TRAMP, Inks, Miss.—There is no difference between hard water and soft water in regard to the fish dwelling in them.

C. M., Dauphin, Pa.—In Minn. the open season for pinnated grouse opens Aug. 15; quail, ruffed grouse and water fowl Sept. 1.

I. S., Gallipolis, N. B.—You will find good duck shooting in Chesapeake Bay and in the Sasquehanna at Havre de Grace.

C. W. B., Urbidge, Mass.—For information as to the Government lands of Minnesota write to the State Commissioner of Immigration, St. Paul, Minn.

J. A., Rawsonville.—You could have barrels made by the Winchester Repeating Arms Co., by the Providence Tool Co., by Sharps and by Maynard.

SUBSCRIBER, Baldwinville, Pa.—The season for water fowl shooting in Maryland opens Nov. 1. In the vicinity of Elkton you may find good duck shooting.

I. N. M., Toledo, Ohio.—In regard to wild rice see letter in this week's paper. Send to this office the address of your friend. It will not be used without your consent.

A. C. T. B., Lake Megantic.—Cannot give you plans of catamaran at present. Have sent you papers containing information of same. See answers in last week's paper.

A. M. B., Phila., and A. Van D., N. Y.—Send your application to John Avery Esq., City Hall, New York City. He is the President of the Blooming Grove Park Association.

L. M. H., Belvidere, N. J.—Cannot give you plans of racing boat in this column, but will send you a design for \$2, if you will be more specific as to kind of boat wanted.

ADUSTA, Augusta, Me.—You can procure any of the books you desire by sending to Appleton & Co., Broadway, N. Y., or to Charles Scribner's Sons, Broadway, N. Y.

J. P. L., Indianapolis.—Letter at hand. Englehardt's Roving Almanac sent; also paper requested. No design for single shell published, but can send you a set of lines for \$2.

TUNA, Bradford, Pa., and G. K. M., Mount Holly Springs, Pa.—I. M. Brown, of 160 Nassau st., New York, wishes to correspond with you. Will you please send him your address?

R. M. F., West Granby.—Where can I get a book on fish-culture, the best book on brook trout? Ans. Mr. Livingston Stone's "Domesticated Trout." Published by Osgood & Co., Boston.

BLACK GEORGE, Mobile.—In a mis-and-out match C breaks three balls and misses the fourth. D also breaks three straight. Must D shoot at a fourth ball to win the match? Ans. Certainly. It is now a tie.

RAND, Itasca.—Please give me the number of pellets in a good target with 10 gauge gun, 4 drs. of powder, 1½ oz. No. 8 shot in a 30-inch target, distance 6 rods? Ans. Three-fourths about of the whole count of pellets.

W. E. F., Cambridge, Mass.—On Mt. Chocorua, N. H., you may get a shot at a bear if your aspirations are so high as that. Partridge shooting is good. Go to see Piper, an old hunter, who lives at the foot of the mountain.

C. A. T., Glenville.—The Hart shell has two kinds of primers, the common one and the Berdan. Common caps would not do. You would want an ejector to load with. The Winchester cannot be wiped from the breach.

H. W. B., Romeo, Mich.—Please explain what you mean when you say, "Load with 3 drs. powder and 1½ oz. shot?" Is it struck measure or heaping, just as you would take it out of a quantity with a dipper? Ans. The load is a struck measure.

E. T. H., Augusta.—Have a pup 8 months old. Eyes inflamed and running. Has no meat for a month. Appetite good. What can I do for him? Ans. Keep them clean with warm water and use a wash containing three grains of salicylate to one ounce of water.

DICK, Palmetto, O.—In shooting pigeons from trap, double rises, if a man misses his first bird and, his gun being properly loaded, misses fire on his second bird, is he entitled to another bird or another double rise, or not any bird? Ans. He is entitled to another pair.

C. L. S., Berwick, Pa.—Please inform me of some responsible parties that breed and have for sale pure blood dachshunds and fox terriers. Ans. For dachshund address Dr. Twaddell, West Philadelphia. For fox terriers, Captain John M. Taylor, Bellefonte, Nottoway Co., Va.

J. W., Pittsburgh.—The three patterns you send us (251 pellets, No. 6 shot, at 40 yds., Parker gun, 10 gauge; 240, No. 6 shot; and 944, No. 10 shot—made up with 4 drs. Dittmar's just class, good all around, and difficult to better. We think the Dittmar just as safe as any other powder.

J. J. P., Cleveland, O.—For a fast sailing yacht write to Pat McGiehan, Pampano, N. J. He has built the well known clippers Bella, Excelior, Mella, Kaiser, Ina, Corn, etc. H. Smedley, of South Brooklyn, or R. Wallingford, of Court st., South Brooklyn, also are known for their fast turn-outs.

SALTON, N. Y.—The centre of buoyancy is the centre of displaced water. The centre of gravity is the centre of weight of the entire yacht, outfit and crew. The former varies its position as the displacement changes in form; the latter always remains in the same place of the vessel.

O. K., Boston.—I have access to a very large muzzle-loading single gun very well made. Barrel 31 inches. Bore just the size of a silver quarter. What would be a correct charge for same and what size shot would apply to it? Ans. Your gun is a No. 6. Load with 5 drs. powder and 2 ozs. shot.

J. N. P., Auburn.—You want us to give you a good *voies de plaisir* for your hunting stories. We would suggest Jackass-rabbit, Jim, or Coyote Chris. We have not been, however, reading much about Western adventure lately. Buy some ten cent novels with a blood-dripping picture cover and choose for yourself.

E. T. E., Washington, D. C.—Think my setter must have worms. Keeps thin, and throws up his food. Have given him vermifuge, is 17 months old. Ans. Give him a teaspoonful of salt each morning for three days, and then a purge of castor oil. Note effects. If not strong give 2 grs. quinine three times a day for a week.

T. L. M., Brookbridge, Ind.—I ask your opinion of the guns made by —, and advertised for sale by —? I want a good gun—one that will wear well, shoot well, and look well. Are the — guns at \$55, \$100 and \$125 to be relied upon? Ans. You can put the utmost confidence in them. First class work, and will last a lifetime.

F. P. H., New York.—It is not a violation of any express statute to shoot with a rifle on Sunday, but a person so doing might be liable to arrest upon complaint that he was disturbing the quiet of the Sabbath. Creedmoor rules prohibit Sunday shooting on that range, and the example is a good one. Day was not made for rifle shooting.

W. J. M., Danville, Ill.—I. Where can I get a copy of "Randall's Practical Shepherd?" 2. Which is best, a long or mid-range rifle for hunting on the plains and in the "Rockies?" 3. Which is best for use, a 10 or 12 bore? Ans. 1. Write to Orange Judd, New York. 2. Mid-range. 3. According to game. If four-footed, a 10; if wing game, a 12.

G. W. H., Goshen.—1. What size or grade of Dittmar powder should be used for duck and quail shooting? 2. Does Bogardus shot with both eyes open? 3. What sizes of chilled shot should be used for duck and quail with No. 10 gun, one barrel choke and the other medium? Ans. 1. O. powder. 2. Yes, 3. No. 4 for duck; we prefer 8 always for quail.

I. M. B., New York.—Answer Proprietor Hotel, Cobbs's Island, Va., and send your letter to care of Old Dominion Steamship Line, New York. Keating's Insect Powder will give the gentle hint to woodticks that their room is better than their company. Carbolic acid is also effective. For duck shooting use 4 drs. powder and 1½ oz. shot. The F. and S. is mailed Thursday morning.

SUBSCRIBER, Phila.—I have purchased a gun made by —, of London. How do they stand as makers? The gun I have reference to is a 9 pound 12 gauge modified choke, Damascus barrels, rebounding locks, pistol grip and cost \$50. Please state in your next issue if such a gun is reliable and what is the proper load? Ans. Your gun is perfectly reliable. Load with 3½ drs. powder, 1½ oz. shot.

R. M. B., New York.—In Pike Co., Penn., you will find excellent sport at Lackawanna. Williamson's Hotel there is headquarters for sportsmen; board \$8 per week. Deer, ducks, snipe, grouse, trout, bass and pickerel will be found in the neighborhood. Good hotels at Milford \$10 to \$12 per week. Another good centre is Schuylers. There are reasonable hotel accommodations. You can hardly go astray.

R. H. E., Middletown, Conn.—We repeat the oft-repeated recipe for aquarium cement. Make a thick paste of these ingredients: Two ozs. powdered litharge, one oz. ground white lead, three ozs. boiled linseed oil and one oz. corn meal. Another good cement may be made by mixing litharge and glycerine to the consistency of putty. It may be used to mend all sorts of broken household ware. Give it a week to harden.

A. R. C., Germantown.—My Skye terrier has a swelling on his utrial organ. In great pain. Have tried an ointment of carbolic acid which seemed to give some relief. Passes water with difficulty. What shall I do? Ans. Difficulty arises from some local irritation. Purge him with castor oil and give five grains nitrate of potash in a little water three times a day. For all diseases of the bladder the nitrate of potash is excellent.

E. C. D., Montrose, Pa.—For a safe steam yacht write to N. Y. Safety Steam Power Co., 30 Cortlandt st., N. Y.; or to Baird, Huston & Co., Beach and Venus sts., Philadelphia; or to Geo. Farr, Buffalo, N. Y. They are all reliable parties and can do as well with you as any one else. For a second-hand yacht advertise in our columns. A 20 foot steam launch will cost new about \$375 to \$400. Will seat six to eight persons. Speed ten to twelve miles.

D. D. M., East Rockaway.—I have a very fine W. & C. Smith & Sons Shore breech-loading, purchased of Schuyler, Harve & Croft expressed for wild fowl shooting, and am thinking about having one barrel choked. Please inform me through the columns of Answers to Correspondents what your opinion is in choke bores for shooting coarse shot, say No. 4 to BB? Ans. A choke bore, if anything, shoots the larger numbers better than the smaller ones.

J. P., St. Paul, Minn.—My Irish setter has felons over her eyes. I thought I had cured her. Since then occasionally matter will form in her eyes. The eyes look glossy, nose dry, appetite fair, but not strong. What shall I do? Ans. Try to improve general health. Plenty of exercise and good food give a good coat. Give a little sulphur once a week and now and again a mild purge of castor oil, and wash the eyes with weak alum water once a day, three grains to an ounce.

J. W. W., Baltimore.—My Setter dog is 4 years old and has something the matter with him. Coat looks dead, and stomach is swollen. Is dull and apathetic. Have given him oil. Does not seem to suffer. I feed him on scraps. He is troubled with fleas. Ans. Perhaps your dog has dropsy, any physician can tell you, and you must destroy the fleas about the kennel at the same time you kill them on the dog. Cleanse the kennel with lime, and wash the whole with water containing a little carbolic acid.

O. V. L., Springfield.—Setter pup, 4 months old, has been sick a month. Gave him oil and he passed a few worms. As he kept growling worse I thought I would destroy him, but thought I would try some salts. He threw up a great many worms. Gave him then arsenic but he is not in good order. Had cancer in the ear, but that is cured. What can I do for him? Ans. Give him two grains of quinine three times a day for a week. Also a teaspoonful of salt the first thing in the morning for three days.

R. E., Newport.—I want to purchase a new breech-loading shotgun to be used on quail, grouse, chicken, snipe, duck and occasionally geese and turkey. How shall I have the bore for this variety of game? I want the gun light, say seven pounds. Should it be true cylinder for one barrel and moderate choke for the other, or should it be moderate choke for one and full for the other? 2. Is the — the best for the money? Ans. 1. Get a 12 bore gun, one barrel moderate and the other full choke. 2. An excellent gun.

PAUL, West Boylston.—1. Please give proper charge, powder and shot, for a muzzle-loading, 15 bore, 30 gauge barrels? 2. In the trial of "Chilled vs. Soft Shot" I see the Orange Lightning gives better penetration than the Dittmar; also, better pattern. Is the Dittmar as good for every-day shooting as black powder? 3. What would you recommend for fall use in breech-loading shot-gun, Dittmar or black powder? Ans. 1. 2½ grs. powder, 1 oz. shot, 2. Dittmar excellent for all kinds of shooting, 3. Both equally good.

G. O. A., Fitchburg, Mass.—Parrishboro', Nova Scotia, is a fine initial point for game and fish. It is the starting point for hunting moose, caribou, bears, wildcats, red and cross foxes, ruffed grouse, black grouse, woodcock, snipe, plover and curlew, and fishing for trout and salmon. Good hotel accommodations, and guides for hunting and fishing. You cannot lawfully kill moose in the Province before October, and then, being a non-resident, you will have to procure a license (fee \$50) from the Provincial Secretary.

J. A. C. K., Parker City, Pa.—1. What is the best gun for a boy of 16, a muzzle, or breech-loader? 2. How much would a book on canoe and sailboat building cost? 3. Where can I get such a book? 4. How much would it cost for a muzzle-loading rifle? Ans. 1. A breech-loader. Half the excellent article in looking, and for this reason a breech-loader is safer. 2. and 3. "Nelson's Practical Boat Building" will cost about \$1.50. Can send it to you as soon as shipment arrives from England. 4. From \$12 to \$20—most any price now.

T. T., Beaver Avenue, Allegheny City.—Where can I get information on the breeding, management and breaking of goats? Ans. There is a series of articles now being published in the *London Live Stock Journal*. It is a very easy matter to break a goat, providing he is not too old. First break him so that he can be driven around without a wagon. After you have him accustomed to the bit you can put a wagon behind him. You will find it a tough job to break a goat after he is one or two years old, as after this age they become very stubborn.

G. P. K., Norwalk, Conn.—The crawfish are, popularly speaking, a cross between the shrimp and the lobster. The scientific name is *Decapoda bartonii* of the Northeastern States, and *A. mississippiensis* of the Western States, with other names for the species of other localities. They are common in all fresh water streams, and we should presume that you would find them about Norwalk. Can be procured in the market. Do not prefer them to Dolous as bait for bass, though much depends upon locality, etc. See *E. P. S.*, Vol. IX., p. 105; Sept. 13, 1877.

G. G., Homosassa.—You told a boat give her a thin coat of linseed oil and dust on the blacklead, rubbing it down smooth. Pot lead may be obtained from R. J. Waddell & Co., 52 Beekman st., N. Y. Cost 10c. per pound. Order 20 pounds. A gallon of fresh water weighs 10 pounds. Six and a quarter gallons make one cubic foot, which weighs 62.4 pounds; if salt water 64.2 pounds. There are 35.24 cubic feet of fresh water in a ton (2,240 lbs.) cubic feet salt water. Ton, 2,240 pounds. Will send book on boat building as soon as shipment from England comes to hand.

L. F., New York.—What kind of game is found in Wyoming and Montana? Which of the two are best for a hunter and trapper? Ans. In these territories you will find elk, mule, black and white-tailed deer, cinnamon and black bears, buffalo, moose, mountain sheep, antelope, mountain lions, jack rabbits, common rabbits, squirrels, gray wolves, prairie wolves, beavers, otters, pinnated grouse, snipe, ducks, geese, cranes, pelicans, brant, herons and sage hens. You will find enough game in either one of them. The Winchester is the better of the two rifles you mention.

J. W. L., Bowmansville.—1. Is powder best kept by putting it into a glass bottle tightly corked? 2. Should it be kept in a warm, dry place? 3. Would Creedmoor rules allow moveable rubber butt to be used if with it the rifle weighed over ten pounds; and in weighing rifle would this be taken off or included in its weight? 4. Would a pad fastened to arm be allowed? Ans. 1. Admirably well. 2. Yes. 3. The rifle alone must not weigh over ten pounds, with trappings. 4. It would be allowed—so that it was not a sling or support to the piece.

SUBSCRIBER, Brooklyn.—I have a breech-loading shot-gun 10 gauge, 9½ pounds, which is too heavy for summer shooting. Could I procure a pair of barrels, 12 bore, 25 or 30 inch to fit the stock? How soon could I procure them? Does chilled shot injure the choke of a gun, or has it a tendency to lead it? Ans. 1. A 12 gauge barrel would lighten your gun so very little as to make but little difference. Would cost about \$75. Go to Squires, No. 1 Cortlandt st., N. Y., or to Madison, Fulton st., Brooklyn. 2. About a couple of months. 3. Not in the least.

F. W. B., Boston.—On account of crowded condition of our columns the design for a deep sleep yacht has been deferred. You may take the design on page 181, vol. 10, draw in the desired depth and retaining the beam, sketch in the frames and so make an acceptable design. But when opportunity offers later on we will devote attention to large displacement craft. A twenty foot jib and mainsail will cost about \$300 new, according to quality of build. Would advise you to pick up a second-hand boat. There are many in Boston to be had from \$150 up. Address "X" has been sent to you. Will take about twenty-five days to build such a yacht.

CANYASBECK, Cleveland, O.—The following are the dimensions of canvas for a sloop 24 feet long, medium rig: Mainsail, 21 feet hoist; 21 feet on boom, 14 feet on gaff; jib, 30 feet on foot; 22 feet on leech. Lay out the canvas on paper, find the centre and place mast so that it will balance with centre of longitudinal immersed section, centreboard down. No definite rule for setting upon dimensions of canvas can be given. Experience governs the amount. It also depends upon stiffness of the boat, consequently above figures are only approximate, as we have not full particulars of the yacht at hand. Total area about 700 feet, and assuming immersed cross section of the yacht to measure 11 feet she will have about 64 feet of sail to 1 of cross section, which is a fair amount for ordinary use.

BOTH IRYS, New York.—Does Carver use a rifle with two sights, or in shooting does he use the sight or sights? I think it would be very difficult for him to use two, or even one sight, and my impression is that a sight on a shot-gun is not needed. These inquiries are elicited by reading the article of "Excursions" in your issue of Aug. 25. Are the Damascus barrels in the — guns imported or made in this country? Ans. 1. The Winchester is the ordinary one with the two sights, but the sights are not used by Carver in shooting. It would be impossible for him to catch the shots with the sights, so quickly does he aim at flying objects. It is very possible that Bogardus does not use the sights in his shot gun. At first he may have done so, but the end of the barrel directs his aim. We could not, however, dispense with the sights. They are used by the shooter instinctively, 2. Imported.

A. F., Sixteenth U. S. J., Fort Riley.—Subscription expires August 9, 1878. To rig a boat 12 feet long, canoe model, proceed as follows, for ordinary rig: Mast, 8 feet long; stepped 3 feet from bows. Lug sail, 6 feet on foot; 4 feet 6 inches on huff, the latter being perpendicular to the foot; 7 feet 6 inches on leech and 4 feet on head. The light pole for the head and one for foot. Have single halliards run through sheave in masthead, or a simple "hitchable" seized on one side of the mast. The lower boom is kept down by a lashing round the mast, or a cleat. Single rope for sheet about 1 foot in from end of boom. For tacking use a "leeboard." If more sail is wanted add a small jib forward and a corresponding "jigger" aft. Latter is simply a light pole, with boom on bottom and a triangular sail stretched between the two. If required have line of reef points in the lug sail 2 feet up from boom. Make sail tight and draw the drilling. Haul all around. If you get gaff and boom through attached "eyeclets" in the huff. Have line from gaff and boom to masthead and down again, so that you can brail up the boom up and down the mast. Lee board should have 1½ square feet immersed.

A CRITIC CRITICISED.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INJUNCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 9832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

*Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, AUGUST 8, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, Aug. 9.—Trotting at Rochester, N. Y.; Prophetstown, Ill.; Figma, O.; Mansfield, O.; Charlotte, Mich. Base Ball: Indianapolis vs New Bedford, at New Bedford; Buffalo vs. Utica, at Buffalo.

Saturday, Aug. 10.—Scottish-American Athletic Club Games. Base Ball: Indianapolis vs. Providence, at Providence; Milwaukee vs. Cincinnati, at Milwaukee; Buffalo vs. Utica, at Buffalo.

Monday, Aug. 12.—Professional sculling at Barrier, Ont. Trotting: Mendota, Ill.; Utica, N. Y.; Genesee, Ill.

Tuesday, Aug. 13.—Sculling as above. Weisgerber-Feinsinger sculling match at Wheeling, W. Va.

Thursday, Aug. 15.—Eastern Rowing Association Open Regatta at Silver Lake.

ANOTHER MILE-STONE.

To-day our readers receive Volume Eleven, Number One. This reminds us that, with the rolling years, the days of our youth are passing and we are growing old. But while assuming with becoming grace the quiet dignity and the increased wisdom which are popularly ascribed to age, we mean never to lose the freshness and buoyancy of the youthful spirit. With ten bound volumes behind us, a subscription list larger than ever before, a steadily increasing demand upon our advertising space, and the most flattering prospects for the future, we might crave the reader's indulgence if we gave way to a little self-laudation. But the many friends whose names have been on our subscription list from the first few weeks, will not expect any such exhibition of this latent talent, and those who know us less intimately might misunderstand our lapse from accustomed modesty. With an expression of hearty good will to all, then, we go on our way, trusting that in the future, as in the past, the FOREST AND STREAM and ROD AND GUN may pursue its onward course among an ever-increasing number of congenial and warm-hearted friends.

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$9; three months, \$1. To clubs of two or more, \$3 per annum.

IN the August number of the *Atlantic Monthly* appears a critical note which should not be left unanswered. A correspondent, in the "Contributors' Club," takes exception to Judge Caton's statement that the Black-tail Deer is confined to the western slope of our continent, and asserts that, having hunted in most of the States and Territories between the Rocky Mountains and the Missouri River, he has found the Black-tail in all of them, and he is informed that it occurs in Idaho and Washington. He also states that the question as to whether the antelope shed their horns is still a disputed one, and winds up his note with a statement attributed to Jim Bridger, and which is worthy of the old man.

The note to which we refer is an unfortunate one, for it is calculated to convey entirely erroneous impressions to all readers of the *Atlantic* who are not up in scientific nomenclature. The case in hand is only another instance of the lamentable looseness with which common names are applied to animals of all kinds. The Black-tail blunder appears especially hard to kill. We have corrected it many times, but it still comes up—smiling, if we may use the term.

The fact is that there are two entirely distinct species of deer inhabiting our western country, both of which are called, in their respective sections, Black-tail. The one to which the contributing critic refers is the *Capreolus macrotis* of naturalists, called, from the great length of its ears, Mule Deer, but known throughout its range as the Black-tail. It inhabits the Missouri River country, and the Rocky Mountains as far as the eastern foothills of the Sierra Nevada. A variety of this species is found, too, in Arizona and Southern California, where it is called by the Mexicans the Burro Deer—a name synonymous with its proper English appellation, for *burro* is Spanish for jackass.

Capreolus columbianus is the other, and the true, Black-tail. It is most abundant on the Pacific Coast, but its range probably extends eastward beyond the Sierras, so that it no doubt somewhat overlaps that of the Mule Deer. The two species are so different in appearance that one need not be a naturalist to distinguish one from the other—an inspection of the tail will decide the matter at once. That of the Mule Deer (*C. macrotis*) is naked below, covered with short, white hairs above, and terminates in a heavy brush, or pencil, of black hairs. It is as different as can be in appearance from the tail of the Virginia Deer. The tail of the Black-tail, on the other hand, is broad, and, except in its color, resembles the tail of the Red Deer (*C. virginianus*), but it is black above and white below. Besides these characteristics are many others which would render the confusion of the two species well nigh impossible even to the most casual observer. It is the name that has done the mischief, and nine men out of ten, no matter where they have hunted, when they hear of the Black-tail imagine that it must be the deer which they know by that name.

This confusion of names is very common, and a few examples will serve to call attention to its unfortunate consequences. All of our readers know that the partridge of the South is the quail of the North and West, while the partridge of the Middle and New England States is the pheasant of the South and West, and is, after all, neither a pheasant nor a partridge, but a grouse. The gopher of Georgia and Florida is a land tortoise (*Xerobates carolinensis*—Ag.), that of the plains is a little ground squirrel (*Spermophilus*), while the gopher of California is another and very different rodent, the pouched rat (*Thomomys* and *Gromys*). Dozens of analogous cases might be cited.

In nine years of campaigning on the plains, in the Rocky Mountains, and on the Pacific Coast, we have never met a reliable hunter who did not believe and strenuously affirm that antelope shed their horns, and the fact has been known to naturalists for about ten years. We must not be understood as maintaining that the whole horn is shed, as is the case with the deer. It is only the sheath that drops off, leaving the core of the horn clothed with a soft, hairy skin which grows hard in a short time, and within a month or two attains its full length. This shedding takes place in late November or December, some little time after the rutting season is over. An interesting account of the process of shedding will be found in Gray's "Catalogue of the Ungulata in the British Museum" (London, 1872).

We may mention in this connection that we have on hand two very interesting articles, one on the "Black-tail of the Pacific Coast," and the other on "Antelope Shedding Their Horns," which will appear as soon as we can find space for them.

THE FLOWER MISSION.

THE conception of the Flower Mission was eminently feminine. Like many another charitable project sprung from the impulse of woman's good soul, it was not at once recognized by the prosaic. We are not surprised that when the New York mission was started some nine years ago, there should have been well-meaning advisers to urge the substitution of the utilitarian for the aesthetics—bread and butter for violets and lilies. How the wisdom of the ladies has been shown by the sequel, and how the flowers have proved themselves to be famished souls more than meat and raiment to the body, is eloquently told in the simple recital of facts which we publish in our Woodland columns. These records are a contribution to floral literature. In all the prose and poetry of flowers we recall nothing more beautiful or touching than some of the incidents here recounted.

The first Flower Mission originated in Boston; there are now similar missions in Baltimore, Cincinnati, Chicago, St. Louis, and possibly elsewhere. There should be one in every city in the land. The New York society was formed in the spring of 1869, and has since carried on its modest work of love with most surprising and gratifying results. The work and its object have only to be known to be warily seconded by generous contributions of flowers and fruits from woodland, garden and conservatory. During the summer of 1877 contributions from seventy-eight different towns amounted to 73,823 bouquets, which were distributed among Hospitals, Homes, Asylums, Prisons, etc. Eleven thousand distributions of fruit and flowers were made to the sick in tenement houses. The actual expenses of carrying on the Mission for the past eight years have only been a little over one hundred and twenty-five dollars. Any donations of money, which are always thankfully received, are spent in the purchase of fruit for special cases of severe illness in tenement houses.

But with the increasing facilities and larger means have also come new avenues of labor. As the work is better known new demands come pouring in, the field constantly enlarges, the demand is ever greater than the supply, and the complaint of the ladies is that with all their careful management they cannot split a rose.

The simple story of their work, as told by the ladies who are engaged in this ministry of the flowers, is a much better plea than any comments we ourselves could make upon it. Our purpose in devoting space to it is a very practical one: Let the men and women and children who read this journal contribute their quota to the good work; and if modesty stands in the way, let the fruits and flowers be sent to the Mission as coming from the readers of the FOREST AND STREAM.

THE DORY "NAUTILUS."

OUR London advices of the 2d inst. announce the safe arrival at Mount's Bay, Aug. 1, of the dory *Nautilus*, from Beverly, Mass. Though we find little to commend in any such foolhardy undertakings as that of the brothers Andrews, who formed the volunteer crew of this little boat, and believe such trips are they undertook to be fraught with dangers altogether out of proportion to the benefits to be obtained from the rash undertakings, the arrival of the *Nautilus* carries with it a little lesson probably never thought of by those who, without any apparent object or aim, set their lives needlessly at peril. The public at large is imbued with a fallacy which the venture of the *Nautilus* will do much to disprove. It seems to be generally the impression that size is one of the chief elements of safety in ships and yachts, and that the smaller the boat the greater the risk of fatal issue at sea. This, however, is not the case. On the contrary, the very reverse is true. The smaller the yacht the safer she becomes. Model, and not size, is the main element of safety. The dory had a better chance of safely crossing the ocean than the big *Mohawk*, and many another craft of her kind. The latter are built on wrong principles for sea-going vessels. Their curves of stability indicate clearly the great danger such craft are in of capsizing at sea. But a boat of only 20ft. in length can be so modeled as to be absolutely uncapizable, and therefore perfectly safe in any kind of weather. She may be less comfortable than her larger sister, it is true, but for all that her small tonnage has nothing to do concerning her safety. It is model and not size, then, that should be considered either in designing a vessel for sea, or for investigating her chances in heavy weather. The smaller the boat the stronger will she be in proportion to the strains brought upon her. Cork up a bottle, put some weight on the bottom, and no gale can destroy it at sea—the neck will float above water dry and snug. Build a yacht on similar principles—ballast low down, easy form, handy rig, and you can brave the storm that would make matchwood or a scrap heap of the biggest vessel afloat.

A NEW HAPPY HUNTING GROUND FOR ENGLISHMEN.—No sooner has the European imbroglio been cleared, and that good lady, Victoria, been made Queen of Cyprus, than Englishmen are casting longing eyes on the game to be found in and near their newly acquired possessions. Perhaps to many English gentlemen, when the news reached them that Cyprus was theirs, this idea was paramount, "What a jolly good time we are going to have with the game in Cyprus! Earl Beaconsfield is a thoughtful fellow after all." As a centre from whence hunting expeditions can be made, Cyprus must present great advantages. The *Field* tells us that on the mainland of Asia Minor, extending from Adalia to Marash, on the Taurus Mountains, there are red deer, fallow deer, roe deer, ibex, chamois, bears, and any quantity of wild boars, besides francolin, while on the plains, between the mountains and the sea, there are partridges, woodcock, snipe and large quantities of wild fowl. With the wonderful facilities England possesses for travel, in four days the sportsman might leave England, be in Cyprus, and in a day more find himself amid the lofty ranges of the Taurus. When England exhausts one hunting ground, she casts her eyes about for another. The gobbling up of Cyprus, and the facilities it will give in Asia Minor for hunting, will make the present diplomacy of the greatest man in Europe most popular. The first wild boar shot ought to be sent to "Dizzy." He would not be prevented by religious scruples from eating it.

MARK BALL.—Scores of our readers will learn with sadness of the recent death of Mr. Mark Ball, who was so well and

widely known among sportsmen. For twenty-three years he was a conductor on the Erie Railroad, in which position his uniform courtesy won many friends. Later, as the traveling agent of the Chicago and Northwestern Railroad, he extended his acquaintance among traveling sportsmen. From 1863 to 1870 he was a member of the Forester Club of Buffalo, N.Y., and afterward the founder of the Canisteo Valley Sportsmen's Club.

ARRIVAL OF CAPTAIN TAYLOR.—We had the pleasure of receiving a visit from Captain John M. Taylor, who arrived from Europe on Wednesday last. Captain Taylor brings with him a pure Yorkshire blue terrier for C. H. Raymond, Esq., bred by the Fosters of Bradford. His portrait and pedigree will appear in this journal in due time. He has also brought with him for his own kennel one lemon and white pointer bitch pup, also a black and black-ticked pointer dog pup, both bred by J. H. Salter, of Tolleshunt D'Arcy, and stud, Dandle Dimmont terrier, bred by Hugh Dalzell, Esq. Captain Taylor had with him also a stud fox terrier. The latter jumped ashore, however, at the Victoria docks in London and bolted home. Captain Taylor trusts they will find the fox terrier again; if not the National Line will have to make it good, as he has the receipt of the National Line, and paid freight on all the dogs. We shall receive from Captain Taylor a course of letters of what he saw connected with the dog, rod and gun in England. Our correspondent speaks in the highest terms of the courtesy he met abroad, both in England and the Continent. Captain Taylor proceeds at once to his plantation in Nottoway County, Virginia.

TIME, SPACE AND "THE HERALD."—Captain Bogardus defeated Mr. Aubrey Coventry, Tuesday afternoon, on the grounds of the London Gun Club, London, England. New Yorkers who read the *Evening Telegram* and the sign boards say that every one reads it—were discussing the scores over their tea biscuits, and the *Herald* account over their morning coffee. The *Herald* and its safety-valve, the *Evening Telegram*, make nothing of time and space. It is a matter of perfect indifference to them whether a thing to-day happens in Paris, London or New York. It all appears this evening and to-morrow morning.

[FROM OUR SPECIAL CORRESPONDENT.] IN ROBINSON CRUSOE'S ISLAND.

ST. PIERRE MARTINIQUE, July 3, 1878.

EDITOR FOREST AND STREAM:

In the language of the eminent statesman of my native State, "I still live." Notwithstanding the time that has elapsed since last I wrote you, I have held my memory ever dear, as usual. Two months ago I nearly "burst the bonds of silence" that bound me, and poured forth my soul in ink flow. The how of it was thus: A weather-stained, storm-beaten package of papers—the same you sent me in February—reached me just as I returned from a month in the woods. I was hungry, I was thirsty and tired, and yet, though my quart of Bass' pale ale stood at my elbow ready to be quaffed, it waited half an hour longer than usual; for just then I espied, in a corner of my shanty that veritable package of FOREST AND STREAMS. With what eagerness I pitched into that same package, only he who has been deprived of their presence for a good year can imagine.

In traveling with the goodly band of hunters who narrate their experiences in your columns, I forgot both food and drink, and only the waning light of afternoon and the little darkey who arrived with my dinner, recalled me to my duties. Then I was hunting over hallowed ground; no less a place than "Robinson Crusoe's Island." Of a truth, my dear friend, I have trodden the very sands in which "poor old Robinson Crusoe" first saw the impress of Friday's foot; I have gathered shells on the very reef on which his vessel wrecked; I have hunted the wild goat, the peccari or wild hog, the wild dog, armadillo and agouti in the forests made ever memorable by De Foë as those in which his hero lived; even the very cave in which was stowed the powder that Crusoe saved from the wreck and in which Friday secured their prisoners, I have visited. In the dark and gloomy forests of the interior and along the rocky shore, with its numerous beaches of silver sand, I have shot birds whose plumage might vie with the rainbow; birds of strange shape and with weird notes; birds with feathers of gold and green, blue, yellow, crimson, and vermilion. My camps have been by the side of rushing streams, beneath gigantic tropic trees and palms that lifted their plumed heads far into the sky.

And this was in Crusoe's Island.

In writing this I give you the credit of having read, when a boy, as every boy has done, the adventures of Robinson Crusoe; of having neglected breakfast, dinner, supper; of having "played hooky," as I have done, to read the pages of that wonderful book. I have a vivid recollection of my first sight of that volume. How I waited for months before the librarian of our public library "forked over" the number which had been on my card so long. With what avidity did I devour it, piecemeal, as I walked home; how many times did I stop—beneath the old elm, beneath the poplars by the cemetery, sitting a while on the ledge that jutted into the road, and when I once got it safe home there was no rest until it was mastered. No book, I can safely say, possessed the interest that centered in Crusoe and his man Friday.

It was only through great exertions that I reached Crusoe's Island; by slow sailing in a small sloop, beneath a tropical

sun, glowing stars and a silver moon, alternate; guided at night by the beautiful Southern Cross, which here serves the same purpose to the mariner that the North Star does to the sailor of more northern seas. I was sailing then from an island where still exist, in almost countless numbers, bands of monkeys, monkeys with the intelligence of human beings (always excepting ourselves, of course); monkeys who would, when I missed a shot at them, curl their mighty tails over a limb and "thump their noses" at me; monkeys that nightly robed cocoa and nutmeg groves and placed the useless hands of the former on the owner's doorstep. That was a month after leaving the island in which I camped in the crater and ferreted out, through storm and mist, the truth respecting the mysterious bird of the volcano. And now I am back again in this island in which I landed one year and a half ago. I have two things to encounter here—snakes and prejudice—but hope to successfully triumph over both.

The snakes are the deadliest known to man; there is no known remedy for their bites, no antidote for their venom. Weekly occur deaths among the laborers, and not a hunting season passes without a death being chronicled of some gentleman of the country. That there are antidotes known to the negroes, I have been assured, and shall try to secure them for the benefit of science. Relying upon the old and tried alligator boots, that for five years have defied alike elements and serpents, I expect to escape. There is, however, no snake possessing the peculiarly venomous nature of this serpent. It seems to entertain a feeling of positive hatred against the human race. It lies in wait, curled over a branch overhanging the bridge paths of the mountains, for the horseman, and deals quickly and certainly a fatal blow. The poorer classes have a superstitious horror of it. They positively declare that it will watch the people from the country going to market, and will stretch itself across their path at dusk when they return, in order to bite them. I hope he is not so black as he is painted, though. Regarding this individual, as well as many others, I must write more fully at some future time. In my gorges and in comings out of the forests and mountains, I much resemble some water animal coming up to the surface to breathe, for no sooner have I shaken the mists of the mountains from my eyes and taken in a good gulp of civilized atmosphere, than back I plunge into the depths of my retreats.

FRED. BEVERLY.

The Rifle.

MASSACHUSETTS—Gardner, July 31.—The Gardner Rifle Club, Haverack range; distance 200 yards, off-hand; two scores of ten shots each; possible 240 Massachusetts, 100 Creedmoor:

	M.	C.	M.	C.	Totals.

On the 28th the second competition for the honor of being placed upon the American Team took place. All the aspirants were present except G. W. Davidson, who is absent at Creedmoor. The other members of the team who represent the Massachusetts Rifle Association are Captain Jackson, H. Tyler, J. E. Brown, J. S. Sumner and William Gerrish, whose elegant scores it will be hard to excel.

CONNECTICUT—Bridgeport, July 23.—The tie on the Howe swing machine, was 255 3 4 5 Geo. F. Hull and J. H. Teackle of Stamford. Mr. Geo. R. Hull won the score of 20, Mr. Teackle making 17. The following is the list of those taking prizes: 200 yards, all comers match—G. F. Hull, score 23, 1st prize; Harry Nichols, 2d, 2d; R. S. Bassett, 2d, 3d; Captain D. E. Marsh, 3d, 4th; G. C. Smith, 20, 5th. Two hundred yards military rifle match—E. R. Latham,

score 21, 1st prize; D. P. Lyons, 20, 2d; William Gormley, 20, 3d; Wallace Gunn, 10, 4th; J. H. Teackle, 19, 5th. Five hundred yards military—Wallace Gunn, score 23, 1st prize; J. H. Teackle, 3d, 2d; Harry Nichols, 14, 3d. Five hundred yards, all-comers match—R. S. Bassett, score 24, 1st prize; S. C. Kingman, 2d, 2d; Wallace Gunn, 2d, 3d; Harry Nichols, 2d, 4th; J. L. Moore, 20, 5th.

CREEDMOOR.—The second competition for the selection of a team to defend the Centennial Trophy during the coming year was continued on Wednesday week last. Three competitors participated, and all made good scores. The weather was very favorable for shooting, a very gentle breeze blowing from the northwest, the light being good and elevations steady. The scores made by the contestants were as follows:

	800 yards.	900 yards.	1,000 yards.	T. I.
F. H. Clark.....	73	72	57	202
G. W. Davidson.....	73	62	64	199
S. G. Dudley.....	73	62	64	199

The spring of Dr. Dudley's gun broke before he finished his score at 1,000 yards. A match was shot by the members of the Irish-American Rifle Club for a Sharps special military rifle. The ranges at which the match was shot were 300 and 600 yards, ten shots at each; standing at 300 yards, any position at 600. This was the first competition. The first winner of the prize was N. D. Ward, who recorded a fine score of 82 points. A number of members of the Twelfth and Twenty-third Regiments shot at the competitions for the selection of teams to represent these organizations in the military matches of the fall meeting.

COMPETITIONS AT CREEDMOOR FOR AUGUST.—Competitions for places on the team of 1875 will be held on Tuesday 13 and Wednesday 14. Saturday, 10th—"National Rifle Association Match," at 300 and 600 yards; Skirmishes' Badge Match, at unknown distances. Saturday, 17th—"Soldier's Match," at 230 P. M., at 200 yards, for military teams of eight; Champion Marksman's Badge Match, at 200 and 500 yards; Wednesday, 21st—"Ballard Match," at 230 P. M., at 200 yards; no cleaning. Saturday, 24th—"Sharps Match," at 10:45 A. M., at 800 and 1,000 yards. Sunday, 25th—"Long Range Challenge Badge Competition," at 230 P. M., at 200 yards. Wednesday, 28th—"Match for 'Gildersleeve Medal,'" at 2:30 P. M., at 200 and 500 yards. Saturday, 31st—"Remington Match," at 10:45 A. M. The Seventh Regiment Rifle Club will shoot for the "Rifles," Saturdays, 10th and 31st. The members of the Amateur Rifle Club will shoot their "Long Range Match," Wednesday, 21st, and the "Short Range Match," Saturday 31st. The Washington Greys Rifle Club will shoot for their "Life Membership" prize, Tuesday, 20th.

COMPETITION FOR AMERICAN TEAM.—To-day the matches will be closed, and next week we will give resume. Ten competitors made their entries on Tuesday. Five of the competitors, Messrs. Jackson, Gerrish, Sumner, Rockwell and Brown, are members of the Massachusetts Rifle Association, and shot in their first two competitions at Walnut Hill range, near Boston; Mr. Davidson is from Providence, and Col. Clark is from Poughkeepsie. The remaining competitors, including Col. Clark, shot their first competitions at Creedmoor. Dr. Dudley, who was one of the competitors heretofore, broke his rifle last week, and as it was not ready yesterday, he will begin the first of his final competitions this morning. The scores were:

	800 yards.	900 yards.	1,000 yards.	T. I.
W. H. Jackson.....	73	73	68	214
Col. H. Clark.....	72	75	66	213
J. S. Sumner.....	73	64	64	201
R. H. Robinson.....	70	71	64	205
R. Fisher.....	66	70	65	201
J. F. Brown.....	67	61	63	191
E. F. Rockwell.....	57	61	53	169
William Gerrish.....	70	51	Retired.	
G. W. Davidson.....	68	61	Retired.	

UTICA—Mohawk Valley Rifle Range, Aug. 3.—Competition for five lion prizes, 200 and 500 yards, seven shots at each distance. We give the leading scores:

	200 yards.	500 yards.
G. A. Trowbridge.....	5 5 5 5 5 5 5 5 5 5	5 5 5 5 5 5 5 5 5 5

E. H. Jr.

NEWARK.—The Amateur Rifle Club, of Newark, Wayne County, N. Y., have issued the programme for their annual prize meeting. It will be held in Wayne County to-day and to-morrow. On the former day a match at 200 yards will be shot at 9 A. M. for prizes aggregating \$35. Forty dollars in prizes will be offered. The feature of the second day's shooting will be a competition at 800 and 1,000 yards for a rifle valued at \$30, and money prizes amounting to \$200. Entries will be received on the range up to the commencement of each match.

ATLANTIC CITY.—A match was shot at Atlantic City, N. J., on Monday, 29th ult., between teams representing various Irish volunteer organizations of this city and Philadelphia. The distance was 200 yards, the highest possible team total 150 points. The best scores were as follows: Irish Volunteers, 105 points; Montgomery Guards, 101 points; Shearers Rifles, 97 points; Emmet Guards, 78 points.

COLUMBIA RIFLE RANGE.—The Columbia Rifle Range, located at Bergen Heights, will be open a few days. It can be reached by the E. R. R. in fifteen minutes. The officers are Col. E. P. C. Lewis, the Hoboken millionaire, President; J. C. Bruce, Vice-President; John Kennell, Secretary, and Colonel Bird W. Spencer, Treasurer.

GEN. SHERMAN AT A SCHUTZENFEST.—Washington, Aug. 6. At the Schutzenfest of the Washington Verein this evening, Gen. Sherman performed the ceremony of crowning the King of the Schutzen Cadets, and made a short speech.

FRAGMOOR—New Orleans, July 28.—Match between teams of four, seven shots each at 200 and 600 yards:

Louisiana Field Artillery.				200 yards.				600 yards.			
Schmitz.....	4	5	4	3	4	4	23	5	5	4	5

MEETING OF THE N. R. A.—On Tuesday, August 6, the programme of the International Military Match, as before published by us, was adopted. General Wingate stated that he had received correspondence in regard to the military match from the Adjutant-General of Massachusetts; General Smith, Commander-in-Chief of the Militia of Connecticut; Colonel Fraser, of Montreal, and Colonel Lorrer, of Nova Scotia. Louisiana and the Department of the Atlantic will probably send teams. On motion it was decided to allow teams to enter from the Engineer and Ordnance Departments of the United States Army, and allow competitors to shoot their fourth competition upon any ranges which they may choose. The beginning of the meeting will be on Wednesday, September 17. The place and dates not yet been determined as of the matches. There will be 24 contests, including the Military Champion Match. The match will be shot in two stages, the first at 200, 500, and 600 yards, seven shots at each distance; the second stage will be shot at 800, 900, and 1,000 yards, and will be open to the competitors who make the 21 highest scores in the first stage.

DR. CARVER'S PROGRAMME UP TO NOVEMBER.—Albany, at Central Park Picnic and Driving Grounds, August 6 and 7; Saratoga Springs, at Glen Mitchell, August 9; Sing Sing, at Brookside Driving Park, August 10; Utica, August 12. Thereafter at Syracuse, Rochester, Auburn, Buffalo and Watertown, arriving at New York, August 15. Newark, N. J., August 16. Place and dates not fixed from August 20 to August 29. Probably at Deckertown, N. J., August 28; at State Fair, St. Paul, Minnesota, six days, 2, 3, 4, 5, 6 and 7; at Pittsburg Exposition, Pittsburg, Pa., twenty-four days, Sept. 9, 10, 11, 12, 13, 14, 16, 17, 18, 19, 20, 21, 23, 24, 25, 26, 27, 28, 30, October 1, 2, 3, 4 and 5. Address all letters and applications for dates of exhibition care FOREST AND STREAM, 111 Fulton street, New York City, N. Y.

[FROM OUR OWN CORRESPONDENT.]

THE SECOND WEEK AT WIMBLEDON.

WIMBLEDON, July 20, 1878.

After all, the second week of the rifle work here is of the most interest to the general reader. True, any one who has donned the uniform and followed the drum and file as a volunteer—has taken part in matches and company competitions, may feel a high degree of interest in the turn of the Queen's Cup, the St. George and the Prince of Wales competitions; but for work of precision, for interesting matches, where the nip and tuck sustains the spectators until the last shot is fired, the second week bears off the palm this year. The second week of the big shooting match has proven even more successful than the first. The weather was not enough to drive all London out to the camp—not that it was much cooler there, but there were plenty of sights and scenes to make one forget the excessive heat. In many of the private camps within the great inclosure there were athletic sports and other entertainments in progress almost every evening. The Canadians in their camp entertained the Duke of Cambridge one evening, and were treated to a speech from the Commander-in-Chief, who regretted that he could not congratulate them as the winners of the Kolopore Cup, but in view of the excellent general work done by the team in the individual competitions, their visit had not been in vain.

"Middle" Sunday, as it is called, gave opportunity for a grand church parade by representatives of the several detachments in camp, to whom the Rev. Dr. Shore, Chaplain to the Queen, preached, while the hymns were accompanied and the musical part of the services given by the bands of the Victoria. The afternoon brought new jam, and luncheon to and fro between the officers and old members of the association were in order. Farrow and John, who are here doing

good work with the Ballard rifle, were invited to luncheon by Sir Henry Hallford, who speaks at all times in highest praise of his visit to America, and never tires of praising the excellent American system of team shooting.

This second week of this nineteenth meeting at Wimbledon has been important in the way it has shown up the American rifles to the eyes of the English shooters. There has been a growing feeling that the American breech-loader had in it some merit which the muzzle loader did not possess, but the tenacity with which Englishmen cling to their opinions, right or wrong, is strikingly exemplified in regard to the relative merits of rifles. They have long held that, while the breech-loader is better for military purposes, for the work—that is, accurate shooting—the muzzle-loader is the preferable weapon. Several members of the American-British team had their faith shaken. Lt. Col. Fenton and Sergt. Gilder have been doing excellent work with the Sharps rifle, and one member took care to carry back a Remington breech-loader with him, that having been the rifle used by the majority of the American team. The member referred to was Mr. A. P. Humphrey, of Cambridge University, and his good sense has been fully justified by subsequent events. Mr. Humphrey this summer, by the use of the Remington rifle, has added materially to his fame in winning the Cambridge Cup by an unprecedented score. This prize was shot for at the annual meeting of the Cambridge University Long Range Rifle Club, June 15 and 19, on University Rifle Ranges, Cambridge.

The shooting in this match was quite unexampled by any previous performance in the competitions for the coveted trophy. The score of Mr. Humphrey (the winner) stands alone, far away, the finest performance that has ever been made in a public match at these ranges (900, 1,000 and 1,100 yards), and the scores of the next eight competitors are much less than that with which the cup was won last year. Mr. Humphrey's grand total, 218, while the scores of the "next eight" ranged from 178 to 180.

But this, crushing as it is to the Englishmen's pet notion, is not all. The recent shooting at Wimbledon bears on it with even greater weight. At this meeting Mr. Humphrey, still shooting with the Remington, won no less than four first prizes during the first eight days of the contest, making in all nearly every day the highest score possible at 900 yards. Thus he made the highest possible score at 900, 1,000 yards respectively in the Armer's and Whiteley competitions, and in the contest for the Halford or Ne Plus Ultra prize at 1,000 yards, in which only "bull's-eye" counted, he made the highest possible count by a magnificent score of seven consecutive eyes.

The superiority of the American gun was further attested on July 1, in the Lords of the Commons match. The highest individual score at both ranges (200 and 600 yards) was made by the only competitor who used the Remington breech-loader, the Hon. R. Plunkett. At the 500 yards range Mr. Plunkett put in ten successive eyes. Of course these results, reflecting great credit on American inventive and manufacturing skill, will inevitably have the effect of upsetting the English prejudices referred to in the beginning, and of bringing American guns into increased demand.

All it means is that the marksmen, determined to have the best possible weapon, think they see it in the almost perfect American breech-loader. The weather, too, has been favorable—hot and dry. "The greatest care has been necessary with the muzzle-loaders to prevent caking of the powder and lead. In the case of the Sharps, this is noteworthy with what care the muzzle-loading advocates take of their weapons. The new arms a glance through the tube tells at once whether it be clean or not. When the next international match comes the Americans will find one of the points which told in their favor—that of superiority of rifles—entirely removed, for the teams here will either shoot with the imported rifle or will use others of precisely similar make on the same side.

Passing over a dozen of matches, team and individual, merely mentioning that the Canadians lost the Kolopore Cup by 11 points, and that after the Eaton boys had taken the Ashburton Shield, with the Scotch lads from Glenalmond at the bottom, a youth from this latter took the Spencer Cup at 500 yards against the Cheltenham and Charterhouse champions, we come to the Elcho Shield match, which is, after all, the chief attraction of the week. As American riflemen, the "match" came off on Thursday last, and if there ever was an American summer's day at Wimbledon it was that one. From an almost cloudless sky the sun came down with terrific force, and the mercury rose to 140 degrees in the open. The teams were not over ready in getting to the firing points, and it was nearly 11 o'clock before the opening shot came from the American quarter. Ferguson fired it. A bull's-eye it was, but upon one of the Irish targets, and his blunder cost his side five points.

The wind was blowing across the range pretty strongly, but what was more important for good work, it was not gusty. It was soon manifest where the victory was to lie. All the teams were strong. No raw men were put in, and with less than half a dozen exceptions, all the teams were made up of old Elcho Shield men. At one of the Scotch targets Whitelaw and Lake coached, and at the other Fraser and McIsaac acted; but the team shot quicker and there was too much Scotch stubbornness. McKerrill, Girdwood and Menzies held to the old face position. The variety of rifles made coaching in the team difficult, even had the men been amenable to it. The English team had three face men, Toller and Blackhouse—perhaps the best of the Scotch riflemen—and Baker, who has fired very wildly and seems to get good scores despite his handicapped position. All the other members of the English team used the back position in some form. A. P. Humphrey, with his Remington, used your Fulton position, as did Lieutenant-Colonel Fenton, who fired a Sharps. The Irish team were all back men, and all but one used Rigby rifles. The Americans secured one of your team marksmen to have seen the style in which they coached each other. One of your American team men of last year, who sat looking on, said he had never seen such team system outside of Creedmoor. They shot very slowly, Wm. Rigby particularly putting in some of those long waits for which he is famous, and when the other teams had completed at 800 yards the Irish had not yet fired rounds to go. The arrangement of the men on the Irish targets showed that they were not without a few lessons. The two Rigbys were squadded on the target with Dyas and Banks, the young men of the team, who are good holders, but need the judgment and advice of old veterans to keep them on the target. There were now and then during the day points which showed that the men had not grasped the American system entirely. At one time a full of the wind brought the four teams to a standstill, and the want of steadiness by the coaches, glancing over the Irish score, it will be noted that they have but two others—and one of them an opening shot—and not a single miss. This shows a wonder-

ful steadiness in holding. In the English squad three others and a miss tell of poorer work, while the Scotlands deserve a better luck with their single outer and unfortunate miss.

At the end of the 800 yards range, however, there was no reason for either team to despair, seeing that Ireland had a lead of only six points in front of England, and eight above. At 900 yards there was not a brilliant shooting, but Humphrey, of the English Eight, scoring 73 out of a possible 75. The Irishmen, profiting by the lessons in team shooting learned in their recent visits to America, increased their lead still further here to twenty, while Scotland, pulling up a point or two, tied England on both ranges.

It was about five o'clock when the last range was commenced in the morning. Some thousands of people, who had anxiously watched every shot as it went, stood giving expression to their approval, as bull's-eye after bull's-eye came up on the targets, by cheers that were, however, instantly suppressed. At the very first round the Irish increased their lead by five points, and from this time the match resolved itself into a case of "Eclipse first to the rest nowhere," as by the finest shooting ever seen in Wimbledon County, the English all crept further and further to the front, until they had attained the splendid total of 1,610, or 43 points ahead of their winning score of last year, which was the highest that had ever been registered to that time.

The struggle for second place between England and Scotland was gallantly fought out to the end. The northern team seemed to get well on the target at first, and the curious light seemed to enable them to make the bull's-eye more easily than as ever on the barrels and sights of their rifles. There was still a glow on the hot sands between them and the butts, but the targets were veiled by a dark, deceptive haze, and another element of discomfiture was the strange fickleness of the wind at this moment. The Irish representatives went on, however, scoring bull's-eye after bull's-eye with monotonous steadiness, and the English, in the end, were driven to the wall. They were led us to suppose that his rifle was held in vice while he fired. Among the English, Humphrey had begun with an inner, and went on making nothing but bulls until suddenly there came a full in the wind, and his ninth shot at 1,000 yards failed to find its billet on the target. McVittie and Menzies for Scotland, William Rigby and Major Young on the Irish side, all nearly made the bull's-eye, but the wind was by this time well nigh impossible that Ireland could lose. The English thing short of a total collapse, and their admirable steadiness forbade all idea of this. Up to the fourteenth round John Rigby had not dropped a point, every one of his shots being a bull's-eye. Again a change of light came, and the champion was thrown off by it to the extent that he could only get centres for the last two shots, and at 1,000 yards with 73 points, precisely the same as Mr. Humphrey had made at the previous range. John Rigby's total of 215 in 45 shots, or only 10 points short of the highest possible, is the best that has ever been made in a team match in England, and only four behind that which Bruce, the American, made at Creedmoor last year. Mr. Humphrey has beaten it once in preliminary practice, and narrowly escaped doing so again yesterday. But for the one chance he would have won it, and probably have beaten it. As it was, his total of 218 was a great performance, for out of his 45 shots only seven failed to find the bull's-eye; while John Rigby had eight inners and a "maggie," and Lieutenant Fenton's 213 was made up of eight inners, two maggies, and 35 bull's-eyes. The English and Scotch teams had finished first, and the close struggle between them in the last two or three rounds had been a very interesting one, but in absolute silence. Then the spectators thronged among the Hibernians, but though the effect of every shot was marked eagerly and whispered among them all, suspense had gone when it was seen that with yet six shots to fire Ireland already led by some points. Only curiosity to see whether Rigby might complete a magnificent score of all bull's-eyes kept the spectators from waiting to join in the cheers for the winning team, which were called for by Mr. Malcolm, Captain of the Scotch eight, and acknowledged by Major Leech on behalf of the Duke of Abercorn and the Irish eight.

FALLACY OF THE PAD RECORD OF PENETRATION.—We give below some extracts furnished us by a correspondent, from a private letter written by an experienced gunmaker of England. They substantially confirm what we have long ago asserted—that the pad, as a test of penetration, gave the most varying results. Some months ago we gave an account of the O'Neil system, which seems identical with that employed in this instance. Mr. Dennison, the well-known paper manufacturer, told us himself he was not satisfied with the pad system. We believe with our correspondent that the method of trying guns with boards of paper, one placed behind the other, will only give philosophical results. The method is not only certain, providing paper of the same thickness and texture is used, but, in addition, penetration can be determined at a single glance:

"I constructed a longish box, with grooves at irregular intervals, cut perpendicularly on the inner sides. I fitted into these grooves, at such distances as prevented all possibility of their touching each other under the shock of the pellets passing through them, carefully selected Bristol board or drawing paper—thin, fine, regular paste-board in fact, all of one thickness. * * * By charging a large number of cartridges with varying loads, so widely different as to prevent all possibility of arriving at erroneous conclusions, even if the evidence of our senses could not tell the fact and slow shaking by sound, etc., and by firing the whole out of one barrel, we arrived at the two loads, giving, respectively, the highest and lowest velocity beyond cavil—the highest penetrating nearly one half more boards. Tried by this proper test, the penetration was found to correspond with the amount of powder, its composition, of course, the force of shock, the quantity of powder with a light charge of shot giving the highest velocity accompanied with the highest penetration, a foregone conclusion under a proper test. * * * Having then got at the highest and lowest velocity-giving charges, I proceeded fearlessly, yet on mere theory and observation, to give a kind of average, and I used the *Field* paper, forty-five sheets stitched, and prepared by the maker as for the *Field*—in a word, identical. At forty yards the lowest velocity gave the deepest penetration! My friends stared. Again and again this was demonstrated. One of the gentlemen challenged me to go back to fifty yards, so as to give a kind of *terre à rien* assurance. 'This is too severe,' said I; 'say 45.' He threw out a hint that I was afraid, which fired me, and I replied that I accepted the challenge, adding, 'I'll stand or fall by my theory.' Result, penetration exactly equal! Both of the gentlemen present are men accustomed to a high degree of being a magistrate in London, the other a solicitor, and he the most acute men, if not the most acute, on guns I ever met with. I placed myself entirely in their hands. * * * I am not aware that such crucial testing was ever actually carried out before; certainly not in this country. My fellow gunsmiths have been consulting me for some time, and I have been even by the *Field* trials my theory is correct. The penetration at fifty yards, I recollect, was fifteen sheets. I think the respective penetration of the two at Bristol boards was sixteen and twenty-three, nearly 50 per cent. more!"

OYSTER CULTURE IN CHINA.—Nowhere, probably, in the world is greater attention paid to the cultivation of "water farms" than in China, where the teeming population develop to the utmost every source of food supply. Where birds' nests, seaweeds, fish of every kind, from the sea to the land, are used as food, it is not to be expected that the excellence of the different species of shell-fish would be overlooked; but it is only lately that the fact has been observed that the Chinese practice oyster and mussel culture on a system not so very different from that adopted in France and England. In the southern parts of China, "collectors" of the oysters are placed in the oyster beds, much after the same fashion as the elaborate tiles and "lives" employed in France. These bamboo oyster catchers, however, are prepared in a very curious manner. The canes are exposed for about two months to the rays of the sun, and then placed for the same period in salt water, when they are again dried for several days. Notches are then cut in the canes, into which empty oyster shells are fixed, and thus prepared they are driven into the sea shore between high and low water mark, and left standing to catch the young oyster spat. Those localities are considered the best where the same heat and fall of water is the greatest, so that the bivalves may be alternately covered by the flood and exposed to the air on the ebb tide. A large trade is carried on by these simple collectors, and successful oyster culturists are known to have amassed considerable fortunes by the sale of their produce. The young oysters seem to develop very rapidly, for they are ready for the market when two years old, whereas the Thames "native" is not fit to be eaten till it has passed at least four summers. Large quantities of oysters are dried instead of being eaten in a fresh state. For this pur-

pose they are removed from the shells, simply plunged into boiling water and removed at once, after which they are exposed to the rays of the sun till every particle of moisture has evaporated. They will keep for a considerable length of time in this state. The finest and fattest oysters bred and fattened on the bamboo culch, are selected for preparation after this method, those taken from the natural beds being inferior in quality, and not sufficiently fat to endure the operation.—*London Globe.*

THE FALL OF A MOUNTAIN IN SAVOY.—An interesting account of the recent falling of a mountain in Courmayeur, Savoy, causing disaster to two flourishing villages, has been communicated to the *Courrier des Alpes* by M. Berard. The phenomenon has been incorrectly reported as instantaneous and the destructive effect complete, whereas the case is that of a mountain which, for twenty days, without cessation, has been dismembering itself and literally falling, night and day, into the valley below, filling it with piled-up blocks of stone, extinguishing all sounds by its incessant thunder, and covering the distant horizon with a thick cloud of yellowish dust. The entire mass comprised in the slope forms a mutilated cone 200 metres broad at the top and 600 at the base (the slope being about 50 degrees); this is composed of hard schist lying close together, but no longer united, and it is united to the body of the mountain only by a verticle mass of 40 or 60 metres thick, which already is fissured and shaken. Periods of repose occur, lasting only a few seconds, or a minute at the most; then the movement recommences, and continues about 600 hours. Blocks of 40 cubic metres become displaced with no apparent cause, traverse the 1,800 metres of descent in thirty seconds, leaping 400 to 500 metres at a time, and finally get dashed to pieces in the bed of the torrent, or launch their shattered fragments into the opposite forest, mowing down gigantic pines as if they were so many thistles. Each such block was seen to strike a fine fire before reaching the bridge between the villages; the tree was not simply broken or overthrown, but was crushed to dust (volatilized); trunk and branches disappeared in the air like a burning match. Rocks are hurled together and broken into fragments that are thrown across the valley like swallows in a whirlwind; they follow showers of smaller fragments, and one hears the whistling sound of thousands of pebbles as they pass. M. Berard reached the edge of the rock (2,400 metres high), on one of the sides of the falling cone, and ventured along it, obtaining a good view of the "terrifying" spectacle. He confirms his conviction that the phenomenon is inexplicable by any of the usual reasons that account for Alpine disturbances, such as penetration of water, or melting of snows or inferior strata in motion; nor does the declivity of the slope explain it. His hypothesis is that some geological force has worked, of which the complex resultant acts obliquely to the mountain and almost parallel to its sides.

A HUMAN HOG.—The *Whitehall Times* has given publicity to the subjoined challenge. There was a terrible explosion at Whitehall on the Fourth of July if the match came off:

The following has been handed to us for publication. If the challenge is accepted, great sport will be expected on the ever glorious Fourth of July.

EDITOR WHITEHALL TIME.

Sir—I have been told by my friends that Mr. Teff of the Chronicle can eat more than I can at a single feed, and that Mr. Teff made little of my effort on the foot bridge Friday last. Now, sir, I will send this, my challenge, to Mr. Teff, and I want you to print it in your paper so that all peoples may now that Mr. Teff can't eat me.

CHALLENGE.

I, Eli Paquet, will eat Mr. Teff of the Chronicle for 1 hundred \$ dollar a side on the 4th July, 1878, at noon of that day, pay or play, good day and good track. Mr. Teff may have the choice of the vittels, which may be either coked or raw, and wait out in quantities of not less than five pounds each, and repeat, and the match to be the best in three with only 10 minutes rest between halves. I await only objections to Mr. Chancy F. Bates being steak holder, but the steak must be all up on the 3 of July, at noon, all preliminary arrangements can be made through the undersigned.

his
ELI X. PAQUET
mark

GEORGE MARCOO, witness.
Since the above was in type we have been informed that if the match can be brought about the Opera House will be given free for the occasion. No doubt much money will be staked on the result, as both men have records as eaters.

THE ALLIGATORS AND THE OX.—It is the Tallahassee *Floridian* which takes the responsibility for this ox and alligator story; all of which must be taken with much salt and more discrimination:

"The ox went into the lake to drink, and was attacked by the alligator, whose mouth

closed on the foreleg of the animal, crushing the bone. The ox started immediately out of the water, dragging the alligator. Enraged with pain, the poor animal reared and plunged wildly, endeavoring to horn his antagonist. Meantime the edge of the lake was black with the snouts of alligators which had smelled the blood that ran from the ox when it first struck from the water. Four or five of the monsters crawled out, and with wide open mouths started for the attack. Meanwhile the ox loosened the hold of his antagonist, and smarting under the wound, went in with infuriated ardor to the assault of the reinforced assailant. He caught one of the alligators on his horns and threw him high in the air, the clumsy thing falling heavily to the ground, where it lay stunned. Another was tossed far into the lake. But the gallant ox was, by a false manoeuvre, again in the water, in which element his activity was impeded, and being surrounded by his foes, one of which caught a shot by the nose and pulled his head under water, he soon fell a victim by drowning."

A BOY'S LETTER FROM COLORADO.—The following ray letter from a lad has been sent us for publication. The writer is at Bell's Rancho, Colorado Springs, and the date is July 8:

"I am going to ride into town and buy some meat. We raced our thoroughbred mare, Meta, against a very fast horse belonging to a man named Gilpin, and Meta beat by three or four lengths. Charles rode her. We raced for a keg of beer, and we had a tough old house-warming, there being a crowd of cowboy boys on broncho ponies. The beer did not last long. The climate is very nice and bracing, but most of the water has alkali in it. This is said to be a bad place for any one with any heart trouble. We hear the coyotes howling from the place in the night, but they are shy. I got a shot by the nose and pulled his head under water, he soon fell a victim by drowning. From your affectionate son, JOHN E. S."

A PIG TO BE PHOTOGRAPHED.—One of the most remarkable cases of instinct that we ever heard of came under our personal observation a few days ago. Mr. Deveaux, the county jailor, was presented with a small pig by a friend living about four-miles from town, and it was tied by him in the Court-House yard. The pig was not over a week old and was brought the whole distance in a sack. On Friday morning last Mr. Deveaux untied it and did not notice it particularly. In the evening he discovered that it had strayed off. On Saturday morning his friend informed him that the pig had returned to his pen, and was with its mother, it having succeeded in making its way far from town to the place of its nativity. The journey was the more remarkable as the way to be traversed was first across Briton's Bay, which is a half mile wide, and thence through the enclosures of three different farms. The pig was seen by some of the men while crossing the bay, who tried to intercept it, but it swam across and escaped to the cornfield in the direction of its home.—*St. Mary's (N.B.) Beacon.*

VETERAN "JACK."—For many years a low-sized brindled dog, named "Jack," has been the pet of the First Precinct, New York City. He is so sagacious that he will not follow a patrolman belonging to any other precinct, and makes his headquarters on the Battery. With all his sagacity, however, "Jack" could not escape the ubiquitous dog-catcher. While taking shelter under a tree in the Park, some days ago, a wire noose was slipped over his neck and he was jumped into the wagon. The news of Jack's capture spread rapidly through the precinct, and Officer Cotter rescued him from his traveling prison before he reached the Pound. The next day Jack paraded the Battery with a large plated collar bearing the inscription: "Old Veteran Jack, the Pride of the First Precinct. Leave him alone!" The collar is the gift of the police and the Battery boatmen.

THE CHICKEN TORPEDO.—Here is a new infernal machine, described by the *Griffin News*. We bet the unfortunate culled person who comes afool of it:

"The invention consists in placing a torpedo charged with powder, slugs and bullets in the interior of a prepared fowl. The chicken is placed on a perch as natural as life, and the explosion occurs immediately on its removal. The balls within are so arranged that they fly in all directions as the instant that the fowl is removed from the perch or roost, and the remover is certain to be instantly scattered around in small particles. This ingenious contrivance, the inventor claims, is perfectly harmless so long as it remains undisturbed, and no one is responsible for the sudden death of the party who tampers with it except the party himself."

SEREN.—Every body in this hemisphere has heard of Seth Green, our principal fisherman; but few are aware that he hath a merry wit which cometh out on occasion. A few weeks since, at the celebration of the completion of the new State Line Railroad, Seth

was invited to join the excursion. Scarcely had the woe alluded train started from Rochester when the fisherman began a sort of salutation and hand-shaking. He had passed through all but the last car, when Jack—said to him: "Seth, you are out of place; you should be in the car where the Fish is" (referring to the Hon. H. Fish, who was in a forward car).

Seth, after surveying those around him, and noticing certain red noses, replied: "I guess I'm in the right place, as there seem to be plenty of suckers here!"—*Harper's Drifter for August.*

THE IRATE EDITOR AGAIN.—We have already referred to the enraged Western Editor as a naturalist. Another member of the fraternity, the editor of the Omaha *Herald*, adds his contribution to editorial zoology in the following allusion to the editor of the Omaha *Dee*, whom he otherwise designates as a "Bohemian baboon":

"This is the bull ring into which we jerk the stultified and web-footed creature who defies all ethnological classification, and ask a civilized community to note the performance of the thing for whom a United States Senator is playing the part of an unwilling sponsor and reluctant stool-pigeon."

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their TIMING WATCHES are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIFFANY & CO. are also the agents in America for Messrs. PATEK, PHILIPPE & CO., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Publications.

The Sportsman's Library OF STANDARD BOOKS. JUST ISSUED.

This Compilation Contains Brief Descriptions
of Over One Hundred and Fifty Books
Upon Outdoor Sports and Amuse-
ments, Together with Between
Eighty and Ninety Spirited
Illustrations of Game
Birds, Fish, Horses,
etc., Many of them
Drawn from
Life.

A most valuable compilation which should be in
the hands of every sportsman, every one who wishes
to acquire the art of shooting or to obtain informa-
tion regarding game, birds, fish, horses, guns, &
equipment, etc. The trouble with it has been, the people
have not known what works were issued on field
sports and pastimes, or where they could be pro-
cured.—N. P. Stanton, Pres. National Rifle Association.

All interested in outdoor amusements will be
gratified with this publication. To know the con-
tents of the book mentioned will fit any man for the
better employment of his time, and if the knowledge
to be gained in this way is practically employed,
better head and longer life will be the result.—
Henry Fulton, Captain American Team 1876.

Send two three cent postage stamps for sample
copy to FOREST AND STREAM PUB. CO., 111
Fulton street, New York.

THE LATEST AND ONLY CORRECT Treatise on the Game Cock.

The undersigned will issue a publication entitled
"Treatise on the Game Cock," as soon as prac-
ticable after June 15, 1876.

The work has been compiled by Mr. P. W. McDou-
gall, whose long experience as a breeder and trainer
of Game Cocks especially for the pit, is a sufficient
guarantee as to its reliability.

Its purpose is to introduce a new and thorough
treatment in breeding, rearing and training the Game
Cock. It will contain such information, and will be
so serviceable to fanciers and breeders that it will
be indispensable to all, and will be preserved as a
book of reference for years.

A few pages of the book will be reserved for ad-
vertisements at prices within the reach of all. We
give every advertiser book enough to pay for his
advertising space.

Fanciers and breeders subscribing for the book be-
cause the same is printed will have their names in-
serted in black type, in the pages reserved for that
purpose, with the variety of stock they raise, for 35
cents (which entitles them to a book). Price of book,
ten cents.

McDOUGALL BROS.,

64 South Illinois St., INDIANAPOLIS.

Painting.

PAINTING.

EVERY ONE THEIR OWN PAINTER.

50 Per Cent. Saved.

We are manufacturing a very "The Pure Ready-
mixed Paint, mixed in such a manner that any ordi-
nary stable or farm hand can make as good a job of
painting as a painter can with paint mixed in the old
way. This is because our paint does not set quick,
and thus show marks of the brush. We sell it lower
than materials can be bought in the ordinary way,
and pay freight on certain sized orders.

Any one wishing to PAINT, will have mailed free,
upon application, our book—"How Every One can
Paint and Select Harmonious Colors." Address
INGERSOLL PAINT WORKS, South and Dover
streets, New York.

Gunpowder.

Lafin & Rand Powder Co.

No. 23 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

No. 1 to 4, strongest and cleanest made, in sealed
1 lb. canisters. Higher numbers specially are recom-
mended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in
metal cans, 6 1/2 lbs. each, and canisters of 1 lb.
and 1/2 lb. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes.
Sizes, FG, FFG and FFGG, the last being the finest.
Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs.
and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.
All of the above give high velocities and less
residue than any other brands made, and are re-
commended and used by Capt. J. H. GARDNER,
the "Champion Wing Shot of the World."
BLASTING POWDER and ELECTRICAL BLAST-
ING APPARATUS. MILITARY POWDER
of all kinds on hand and made to order.
Safety Fuse, Frictional and
Platinum Fuses.

THE HAZARD POWDER CO MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric Powder."

No. 1 (fine) to 6 (coarse). Unsurpassed in point of
strength and cleanliness. Packed in square canisters
of 1 lb. only.

Hazard's "American Sporting."

No. 1 (fine) to 6 (coarse). In 1 lb. canisters and
6 1/2 lb. kegs. Fine grain, quick and clean, for
upland game shooting. Well adapted to shot-
guns.

Hazard's "Duck Shooting."

No. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters
and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and
clean, shooting remarkably close and with great
penetration. For duck, forest or water shooting, it
ranks any other brand, and is equally serviceable
for muzzie or breech-loaders.

Hazard's "Century Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25,
12 1/2 and 6 1/2 lbs., and cans of 5 lbs. FFG is also
packed in 1 and 1/2 lb. canisters. Burns strong and
rapid. The FFG and FFG are favorite brands for
ordinary sporting, and the "Sea Shooting" FG is
the standard rifle powder of the country.

Superior Mining and Blasting Powder.
GOVERNMENT GANNOON & MUSKET POWDER;
ALSO, SPECIAL GRADES FOR EXPORT OF
ANY REQUIRED GRAIN OR HHOOF, MANU-
FACTURED TO ORDER.

The above can be had of dealers, or of the Com-
pany's Agents in every prominent city, or wholesale
for export.

85 WADSWORTH STREET, NEW YORK.

Sportsmen's Goods.

SPECIAL NOTICE

TO

GENTLEMEN.

We have just received a direct importation of East India novelties, to which we desire to call attention:

- 1st. 25 pieces pure Corah Silk, a delicate fabric, of soft, creamy shade, which we sell by the piece.
- 2d. 25 pieces real Seersucker, which was made in narrow stripes expressly for us. We shall make suits to order, and keep in stock Sack Coats ready made during the month of August.
- 3d. Chogas.—A few of these fine embroidered Camel's-Hair Smoking Jackets for gentlemen, such as we offered two seasons ago.
- 4th. 25 pieces Pure Pongee Silk. These silks, made into suits, we offer as the coolest and most attractive summer garments for gentlemen ever shown. Price only \$11 per suit.
- 5th. 50 sets of Pijamahs and Cobias—or East India Sleeping Dresses. These were made to order in Canton, and are very handsome and desirable, at same time inexpensive. Last season we sold the suits at \$15. This month we offer them at \$9.
- 6th. 30 pieces genuine old fashioned Nankeen. This we sell by the piece or make to order into suits for gentlemen or children.
- 7th. A few dozen East Indian Silk Sashes, to be worn with Children's Summer Suits. These are very fine in quality, but very cheap. Price \$2.

Price, \$71.50, extra by mail. Send stamp for illustrated Catalogue. THOMSON & SONS, P. O. Box 1,016, 301 Broadway, New York.

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly fit any standard make of gun of 10 or 12-calibre—calibre of rifle 22, 28, or 44 as desired. Length of barrel, twenty inches. The shells used with the best advantage are the Winchester Repeating Arms Co.'s cartridges, No. 32 and 38, extra long, and No. 44, model 1873. Send for a Circular and Price List.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

At the international pigeon shooting, Monaco, Feb. 1878, the Grand Prix de Casino, an object d'art valued at \$160, and a money prize of \$700, this the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Chomondony Fennell, with a full-choice bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 28 yards and 1 foot and 29½ yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record. The winning gun at the choke-bore match, 1877, beating 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Purdie, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 56 birds out of 100, using one barrel only. The winning gun also at the great London Gun Trial, 1875, beating 103 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 5, 1875; No. 168,993. BEWARE OF IMPRIMENTS OR IMITATIONS.

W. W. GREENER, St. Mary's-Works, Birmingham, England. H. C. SQUIRES, Agent, No. 1 Cortlandt Street, New York City.

TATHAM'S IMPROVED CHILLED SHOT.

American Standard Diameters.

(RED LABEL.)

Gives greater penetration and better pattern than ordinary shot. Equally well adapted to choke-bore, modified chokes and cylinders.

Our chilled shot will be found free from shrinkage, more spherical, more uniform in size, harder, heavier and of brighter and cleaner finish than any other. SEND FOR CIRCULAR.

TATHAM & BROS., 82 Beekman St., NEW YORK.

Also, manufacturers of PATENT FINISH, AMERICAN STANDARD DROP SHOT, and COMPRESSED BUCK SHOT, more uniform than the ordinary moulded shot.

Medicinal.

BRANDRETH'S PILLS.

We believe these celebrated pills are pre-eminently by their inherent merits to be the medicine of the world. They impart a power by which every organ of the body becomes healthy. Nature has formed the bowels so that they are capable of drawing to them the impurity of any organ of the body, however distant. So we have little more to do when we are sick than to purge freely with a medicine time has proved will not hurt. This treatment always quickly restores the health when adopted in time.

BRANDRETH'S PILLS

cure both constiveness and diarrhoea. Ask the man who was dying from constipated bowels what cured him; he tells you Brandreth's Pills. Ask him who had dysentery for months what cured him; he says Brandreth's Pills. Ask him who has the best medicine for small pox, and they prevent any marks. A case occurred recently where Brandreth's Pills cured a deep liver, which the doctors said would never be removed by amputation; yet twenty-five boxes cured it and restored the patient's health. Reference: W. M. Skinner, of White Plains.

Brandreth's Pills are not a quick medicine, but a scientific preparation, which have been prepared by the present proprietor for over fifty years. They are wholly composed of innocent herbs and vegetable essences, are incapable of hurting the most delicate, yet are to cleanse the bowels and blood and exert a curative effect upon every form of disease. Where for twenty years the patient had a movement of the bowels without much relief, or medical means, a month's use of Brandreth's Pills cured, restoring the bowels to regularity.

The secret of recruiting the vital principle is discovered in this medicine; it generates and increases healthy animal warmth. Provided the great organs are not irreparably injured, there is no disease Brandreth's Pills will not cure. Remember, they concentrate the vitality of the system to effect the disease wherever located in the body.

BRANDRETH'S PILLS

are sold by all dealers—35 cents a box, either sugar-coated or plain—and at Dr. Brandreth's

PRINCIPAL OFFICE,

294 CANAL STREET, NEW YORK.

STOP AND READ.

All forms of Kidney diseases, Pains in the Back, Sides and Loins, are positively cured by

GRANT'S REMEDY.

Its effects are truly marvelous in Dropsy Gravel and Bright's disease. No matter of how long standing the case may be, positive relief is had in from one to three days. Do not despair, hesitate or doubt, for it is really a specific and never fails. It is purely a vegetable preparation. By its timely use thousands of cases that have been considered incurable by the most eminent physicians have been permanently cured. It is also indorsed by the regular physicians and medical societies throughout the country. Sold in bottles at two dollars each, or three bottles, which is enough to cure the most aggravated case, sent to any address on receipt of five dollars. Small trial bottles, one dollar each. All orders to be addressed to

TROUT FISHING.

This twenty years. Do you remember
When, boy and girl, we stole the skiff,
And went a fishing one September?
The lake so clear, it was as if,
Upborne on love's delicious leaven,
We floated in a pure mid-heaven,
With clouds of lilies for a border.
The fragrant summer seemed to ache
In blossom for dear passion's sake,
Excessive with its sweet disorder.
In you, too, was that fond distress
Of flesh and fear and happiness,
Caresses by caress unhanded,
Till, fingers mated on the reel,
I thought the very trout could feel
His double spoil was caught and landed.

Alas! that love which we remember,
Blush-ripe as all the wanton weeds,
Succoed as a blossom of September,
Bora gullies of the promise seeds—
Sweet dying things, whose only duty
Is clothing life in forms of beauty!
For though I held you in my arms,
As full of honey in your charms
As when the troil holds the clover,
Your fingers, tutored in a thimble,
In playing trout were found so nimble
You hooked the fish and cast the lover.

But often, since we slipped the hooks
To play for life with baited hooks
In pools less pure, do I remember
The fragile blossom of September,
Bora gullies of the promise seeds—
A dying thing, whose only duty
Was clothing life in forms of beauty,
With heaven above and heaven below it.
Though life has grown to other needs,
Our boat lies rotting in the weeds,
And we can neither raise nor row it.

—WILL WALLACE HARNET, in *Harpers Magazine*.

Two Bear Stories.—No. 2.

BY PENOBSCOOT.

[Concluded from Vol. X., page 274.]

IN regard to the changeable temperature theory, the following perfectly unvarnished statement of facts ought to settle it: A friend in Maine, being out one day with hounds, started up a buck, which, in his course, happened to run over a bear's den, scaring out an old she bear and her two cubs of the spring before. This was the 10th of December, there being eight to ten inches of crusty snow on the ground. The hunt was at once transferred to the new and more exciting game. Failing to secure them that day, a party of four pursued them all the next without success, their numbers increasing instead of diminishing, as these bears, in their terror, ran over the den of a very large male bear, which also came out and joined the others. The next day the hunters killed the two cubs. The tenth day they killed the old she bear, leaving the big male alone in his glory. During all this time they had confined their operations to a piece of woods a little less than three miles square, in the immediate vicinity of which the hunters lived, the track at night being frequently left within fifty rods of some of their homes. I reached home from a trip to Union River the day the she bear was killed, and it is hardly necessary to say that the next morning the party was augmented by one. For five more days the hunt was kept up, when Christmas dawned on us, one of the coldest throughout the greater portion of New England on record, the thermometer in our neighborhood at sunrise registering 35 degs., and the opinion was expressed among the boys, as we plunged into the woods, that the "old fellow would be too stiff to stir," which opinion was strengthened by the fact that he had been twice so severely wounded that he dropped in his tracks, but had at once regained his feet and made off apparently as well as ever, both the men declaring firmly, however, that they had shot him through. During the hunt we had tried every good dog that we could hear of within ten miles around, but had not succeeded in getting one which would attack the bear. This was, doubtless, owing in a great measure to the cowardice of an old hound we were obliged to keep as a tracker, for it is a well-

established fact that the bear leaves a fainter scent than any other animal in the State. Plenty of ordinary dogs cannot follow the track by the scent at all, even when just made, and not one in a hundred can follow it two hours after the animal has passed. The hound in question was the best in that respect I ever saw, but would not get within a hundred paces of the bear if he knew it; and if by chance he caught sight of him making a charge he would run yelping back, and never stop till he reached some of us, even if we were two miles in the rear. This pusillanimous conduct had a fearfully demoralizing effect on all the dogs we could get, and occasioned an amount of profanity among the boys sufficient to have run an ordinary mining camp for six months. We had long ago learned the futility of attempting to get a shot by following his track, and always after leaving him at night he would execute a series of manoeuvres which would frequently take us till after mid-day to unravel.

On reaching the place where he intended to pass away the night (usually in the thickest spruce growth he could find), he would pick an armful of boughs and, carrying them to where three or four short scrubby spruce or fir grew, would lay them down in their midst, and getting on them would bend the tops of the shrubs over him, forming an arbor under which he would remain always till we started him out, but always getting off before we came in sight of him. We had therefore adopted the plan of stationing ourselves at the various points where he would be likely to pass during the day, one man only following the tracks with the dogs. But on this Christmas morning we all followed up the tracks, for a man can't stand on a runway with the thermometer thirty-five degrees below zero, or at least he can't get off it, if he stands there long! After following the trail for about two hours we found it lead into a small opening made by the fire, the trees turning up after being killed, which rendered it extremely difficult to pass through it; so we skirted its edges, and, going entirely around it, made the discovery that there were no tracks out. This was better than we had hoped for, and we immediately disposed ourselves so as to give him a warm reception when forced to make his appearance. One of the boys had a double-barrel rifle, one barrel of which was a double shooter, thus giving him three shots. Him we placed on the tracks leading into the opening, as experience had taught us that he was more likely to come out there than in any other place. It was my turn to go in with the dogs. I had worked my way nearly to the centre of the "blow-down" with the dogs at heel, when I came suddenly on his bed, under the body of a large tree turned up by the roots. The ground was only partially clear of snow, and here he had lain through that bitter night without anything under him but the snow and frozen ground, and nothing over him but the log, at least three feet above him. I whistled forward the dogs, and almost at the same instant heard behind me the crack of Dan's rifle, making innumerable forest echoes in that cold air. The bear, on hearing my approach, had run a semi-circle, straight to his back tracks behind me, and was at the edge of the opening almost as soon as I got to his bed. A second report quickly followed the first, and as I hastened back a third rang out sharply on the morning air, followed by a shout of "All right."

As I neared the spot where the shooting took place I heard some of the most emphatic language I ever listened to, and on getting there I found Dan, usually the coolest of his shoulders, the most placid of men, in a high state of excitement; but no bear!

It was several minutes before he calmed down sufficiently to give an account of the affair, during which time we had all collected around him.

It seemed that when he first saw the bear he was walking on a log, broadside to him, not having yet got into his "back tracks." Taking a deliberate aim just behind the shoulder, he "unhit," and the bear "went down like a stone." He stood for a moment and was just going to call out, when he saw the bear on his feet and about striking his own trail, the log behind which he fell having concealed him up to this point. A second shot again rolled him over; but instantly regaining his feet he started down his tracks directly toward the astonished Dan, who was beginning to regard him as bullet-proof. As he approached Dan delivered his third and last charge full between his eyes. The brute pitched forward and fell headlong. Naturally supposing that an animal shot through the head must be dead, he had shouted to us, and, setting away his rifle, was very coolly taking out his pocket-knife for the purpose of cutting his throat, when the animal again struggled to his feet and stood reeling to and fro for a moment, so near to him that he could see him lap the blood as it ran down over his nose. Stepping back in a moment he rushed forward on his old tracks, and not caring to be caught fooling with a bear of his size and toughness, with nothing but a pocket knife and empty rifle, Dan very respectfully gave him the right of way. A short inspection of the ground bore out Dan's statement.

In the meantime the dogs, which had gone ahead on the track, showing conclusively that the bear was still alive and able to repel an assault in that direction.

On following him up we found that he was barely able to keep out of our way, as we came in hearing of him several times, the dogs refusing to advance any faster than we did. We soon decided that it was best to leave him for that day, believing that the effects of his wounds, and the cold combined, would render him incapable of getting out of our way in the morning, so we struck out for home, the most of us

going to a Christmas dance that night, so as to be sure and not oversleep ourselves! The next morning we were on hand before sunrise, the weather having moderated but very little. We soon reached the spot where we had left the trail—a very favorable place on the side of an open ridge, which they had previously avoided. The dogs, feeling unusually well, bounded forward unchecked, as we did not anticipate starting him till after the usual amount of circling, which would give us ample time to overtake them. We had gone nearly a quarter of a mile, however, before we heard a tremendous outcry from the dogs, only a short distance in advance. The uproar increased every moment; the baying of the old hound and the savage snarls of the other dogs, mingled with the roars and snorting of the bear, showing that a desperate fight was in progress. We soon reached the battle-ground, and were in speechless surprise to see dogs which for two weeks had exhibited nothing but fear and cowardice, attacking the enraged and foaming bear, not only with courage, but with absolute fury. Even the old hound was barking furiously not twenty feet away; and catching sight of us as we came up, he made a gallant charge on the bear, and actually scratched some hairs from his ridiculous apology for a tail. For some moments, so close was the fighting, we could not get a shot at the bear without running the risk of shooting a dog; but as the old fellow warmed up to his work, he soon cleared a space around him, when a shot under his ear laid him low, ending at once his life and the longest bear hunt on record. A short examination was sufficient to show that the shot between the eyes had glanced upwards on the skull and come out between the ears, inflicting only a slight wound. On skinning him, however, four bullet holes were found in his body, two, evidently shot by Dan the day before, had grazed his lungs, and lodged against the skin on the opposite side. His lungs were very much bloodshot and inflamed, showing clearly what had occasioned his distress. The other two bullets went completely through his body, cutting the intestines in twenty places. In his normal condition they would have proved fatal in from two to six hours, and they had been shot through him, respectively, four and six days before. The plug (a name more expressive than elegant) was found intact, not having any use for his intestines, or any action in them; their being out to pieces did not seem to affect him in the least. His coating of fat had greatly wasted away, and that which remained had totally altered in character, being of a tough, leathery consistency, wholly differing from its appearance when the animal is killed without being run. It seems incredible, and a total subversion of all the laws of nature that an animal could run sixteen days without eating or drinking, or having any action of the bowels or bladder, he shot in the meantime five times and then make a desperate fight. He would undoubtedly have whipped the five dogs easily if let alone. But all the participants in the hunt are alive, and can testify to its entire truthfulness. The conduct of the dogs was as unaccountable as that of the bear. We examined the ground with the greatest care to arrive at solution of the mystery. The bear had gone straight from where we left him the day before to an old den that looked as though it had been used for ten years. It was dug under the roots of an enormous upturned pine. Into this he had crawled, it being well provided with dry moss and leaves, and the dogs had attacked him while in it, as he could easily be told by hair lying at the mouth of it, as the furious manner in which he had torn out of it. What induced them to make the attack will always remain a mystery. They probably came upon him unexpectedly to themselves, and the boldest, encouraged by the others, began the battle, upon which the others joined in.

I had just finished this article (as I supposed) when your issue of May 31 came to hand with its "Gossip About Bears." I am afraid the subject will hardly bear so much writing up, but cannot forbear adding a few comments. So far from being "nearly extinct" in the State, they are certainly rather diminished in Maine and New Brunswick during the last thirty years, in proof of which I might cite the payment of bounties is such a heavy tax in Maine that it was introduced into the Legislature last winter (and I believe passed) repealing it. I have a brother-in-law in that State who has yet to see his thirty-eighth birthday, who, when I left last fall, was looking round a mighty pert for two more bears to make up fifty shots or trapped by him in the last twenty years. And they are certainly not decreasing in the North Woods, for it was the unanimous testimony of guides and hunters last October that the bears had not been so plentiful for years. In regard to the assertion that the bear "has from two to six cubs, usually three or four," I would reply that it is doubtful if there is a single perfectly authenticated instance on record of the American black bear having more than two cubs at a birth, for it must be remembered in the last twenty years as where more than that number have been found with a female are no proof, for numbers of bears, having young cubs, are trapped every spring. These, when pressed by hunger, give utterance to a peculiarly plaintive and pitiful cry, which, in the stillness of the forest at night, can easily be heard for half a mile. This will attract other females having young, when the cubs will be made to remember in the last twenty years I have tracked scores, I have never found more than two following one dam; nor have I ever found or heard of more than that number being found *in utero*. Of course I do not insist that triple (or even quadruple) births never occur, but that they are so very rare that they must, if occurring at all, be classed as exceptions.

EELS GOING UP STREAM.—*Liberty Square, Pa., July 28*—*Mr. Editor:* I have often seen eels going up the Susquehanna and always along the shore. I have caught them in a small net for bait from three to six inches in length. When they start you will find them all along the river; when they stop at one point you will find they stop all along the river. I have noticed on several occasions, when they begin to move, you will find them going up at all points along the shore on both sides, but never along the islands. Although the river may be filled with them, I never saw any eels going down.

Natural History.

For Forest and Stream and Rod and Gun.
CORALS OF LAKE ERIE.

WE have been accustomed to think of the coral animals as having a home only in the torrid zone, which is substantially true of those now living, but the oceanic waters of a former age were sufficiently warm for their existence in other parts of the world, and this is proved by the presence of their corals in beds of limestone far from the Equator. Such a bed lies under the waters of Lake Erie, "cropping out" on the islands and along the shores, and extending many miles away. Nature, not being able to perpetuate the existence of the coral animals in this latitude in consequence of the cooling of the earth, has made their remains immortal by imbedding them in the limy sediments of the ocean, which, in time, together with the remains of other marine animals, became crystallized into solid rock. This ancient formation belongs to the oldest group of sedimentary rocks, which is proved by the fossil remains of trilobites. "Millions of years before man walked the earth these creatures lived their life, and the limestone took on their form, and here they are!" Subsequently this bed of corals was raised above the ocean by "geological revolutions," and it supported large bodies of ice during the glacial epoch. This is proved by the glacial marks on the surface, which are now distinctly visible on the islands of Lake Erie at Strong Point, near Monroe, Michigan, and at Sandusky, Ohio. Those long parallel grooves and scratches may be followed to where they dip into the lake at an angle with the horizon of about five degrees. Subsidence was again effected by other geological disturbances, and it received a vast amount of sedimentary deposits, and then became dry land again as we now see it.

The corals found in these rocks resemble leaves, roots and branches of trees, mushrooms, liverworts and lichens, goblets, vases and the horns of animals. When broken the fracture appears like marble, and the fine lines of the cells or compartments, each like an oval, forming six-sided columns, are distinctly visible. Sometimes the fracture shows spots where the cells are stained a dark red or brown, and in some instances a thick tarry substance has been found in the cells, having the odor of petroleum.

Although millions of years old, we may, perhaps, form some idea of the animals they represent by an examination of those now living in tropical seas. They were simple in structure, each like a form, and some like their skeleton. Their soft, cylindrical bodies were but little higher than their breadth, slightly depressed on top, the outer margin being fringed with leaf-like tentacles, in the centre of which was the mouth opening into the well-like stomach below. Some were identical with those of the present day, so accurately described by Prof. J. D. Dana in his matchless work on "Corals and Coral Islands." He says, "A good idea of a polyp may be had from comparison with the garden aster, for the likeness to many of them in external form, as well as delicacy of coloring, is singularly close. The aster consists of a tufted disk, bordered with one or more series of petals, and in exact analogy the polyp flower, in its most common form, has a disk fringed around with petal-like organs called tentacles. Below the disk, in contrast with the slender pedicel in the aster, plant, the polyp has a short, thick, cylindrical body, often as broad as the disk itself, and sometimes not longer, which contains the stomach and internal cavity of the disk; and the mouth, which opens into the stomach, is at the centre of the disk. Here, then, the flower-animal and the garden-flower diverge in character, the difference being required by the different modes of nutrition and other characteristics in the two kingdoms of nature. The polyp, in fact, is an animal, and the aster is a plant." The part of an animal between the stomach and outside covering or skin, is divided vertically into sections, between which thin, porous plates of coral slowly arise by growth, with one edge in contact with the stomach, and the outer edge joined to a growing circular plate or cylinder of coral inside the skin. This stony structure within the body of the animal is its skeleton. The polyp grows in these partitions grow also, for the bones of an infant grow.

The animals are not "coral insects," as many suppose, moving about hither and thither in search of building materials, as do the bees and the wasps. It is true that corals are found having the appearance of honeycombs, but they were not made in the sense that insects make or build their combs; the polyps do not build at all. They take in food and seawater, from which is secreted carbonate of lime, particle by particle, for the growth of coral, just as other animals secrete from their food the phosphate of lime for their growing bones.

The polyps propagate generally by the budding. A protuberance, or bud, is formed on the external surface of the body, and in time it develops into a perfect polyp, which buds in the same way. Its offspring—also buds, and thus a colony is formed, all united to the parent, and thus a colony, which is one secret from its food its part of the coral formation, which, in time, together with the coral animals, grows into a symmetrical body. This mass of living animals is called a zoothome, and the coral mass is called a corallum.

The above description seemed necessary in order to answer in a more intelligent manner the inquiry, "What gives the six-sided form to the coral cells?"

The bodies of young polyps are soft and cylindrical, and when coral is formed without budding, or when the offspring are not attached to their parents, the coral is cylindrical also. When budding takes place, and a zoothome is formed, all the polyps grow fast to each other, and lose their original form—the cylindrical is merged in the hexagonal. This may be illustrated by a bundle of straw cylinders (rubber tubes, for instance), which, when compressed with an equal force from all directions toward the central tube, become six-sided from necessity.

Some species of polyps do not grow upward in a mass—they spread themselves out horizontally. The parent, on coming to maturity, multiplies by budding, its offspring growing fast to their sides, each having forced within their bodies a rectangular mass of coral, and thus a colony is formed, and all being united to the parent coral growth. A beautiful network, with meshes only one-twentieth of an inch wide, is thereby produced, which conforms to the undulations of the sea bottom on which it rests. In some cases, during the formation, there is a constant deposit of sediment, so that the last, or outside

animals, in coming to life, are obliged to live on a little higher plane of sea-mud than those before them, and the borders of the network will gradually move upward into a scutellated form—a shallow, scolloped basin. Sometimes circumstances prevent their spreading in all directions, and then we have the appearance of skeleton leaves in great beauty.

Fossil corals differ from living corals by having all their cells filled with carbonate of lime by induration. Living corals have their last-formed cells empty when the polyps die.

We may, perhaps, have a faint conception of the age of their ancient formations by going backward through all the generations of man to Adam, and also through all the stages of development of the pre-Adams, then down through the age of mammals, through the age of reptiles, through the age of plants, through the age of fishes to Silurian time, in which polyps first lived. This carries us back to the very dawn of life upon the earth. T. DWIGHT LANSFORD.

Erie, Pa.

MORE ABOUT DEER AND THEIR HORNS.

MARQUETTE, Mich., July 13, 1878.

EDITOR FOREST AND STREAM:

During a ramble in the woods on the south shore of Lake Superior, and from which I have just returned, I picked up a specimen of deer's horns about ten miles north of Grand Island, which I forward to you by express, hoping it may help to explain the mystery of what becomes of the deer's horns. My own theory of this matter is that they are eaten by porcupines and mice. This specimen shows signs of having been attacked by an animal having larger teeth than a mouse. D. H. MERRIT.

NEW YORK, July 16, 1878.

EDITOR FOREST AND STREAM:

Your correspondent, C. S. J., in your issue of the 6th of June last, I think, is quite correct in his views. From a long experience in the woods in the Adirondacks and Canada, I can testify that deer do not bury their horns after shedding them. The fact that they are so seldom found is no proof of the animal's habit of burying them. The debris of a wood and destruction by mice and other rodent, etc., will account for their disappearance. In Canada, in October, 1874, I made a trip to a hill called Caribou Mountain, hoping to shoot some of the aforesaid deer. I bagged no game, lumbering operations during the preceding winter having apparently frightened the animals off this favorite ground; but I did bag a number of fine caribou horns. The right and left antlers were, of course, separate. The ground was strewn with hundreds of caribou horns, some evidently dropped five or six years before, and some the previous spring or late winter. I did find some signs of preservation, however. I think C. S. J. is right, also, regarding the reasons for the deer's habit of scraping their horns against trees and bushes. In regard to a deer's carcass floating when in the "blue coat," and sinking when in the "red coat," I can testify to those facts from experience with many deer shot in the Adirondacks. When red they sink like a stone; when blue, float buoyantly.

MANHATTAN.

TWIN LAKES, ORANGE CO., Fla., June 30, 1878.

EDITOR FOREST AND STREAM:

I do not recollect seeing any mention in the "Sportsman's Gazetteer" of the habits of the deer in feeding at changes of the moon. I do not suppose, however, that a native hunter in Florida has not implied just in the moon theory. They say "deer always feed at moon up, moon down, and south moon above and below," which means rising and setting of the moon and when it is in or against the south, whether overhead or underneath us. Four times a day deer feed—about an hour each time—lying down between times. The natives say the same rule holds good with reference to feeding of birds and fish. I know several of the most successful hunters, who have done nothing but hunt all their lives, and they always time their hunts to the above mentioned hours. What do sportsmen say about this in other sections of the country? S.

The suggestions made by our correspondents, Mr. Merrit and Manhattan, offer, we think, a perfectly satisfactory explanation for the rapid disappearance of deer's horns. They have been made before and in these columns.

The specimen received from Mr. Merrit shows well the manner in which the destruction of the horn takes place. In this one the tines are all gnawed off, and the main branch has been so far eaten away that the spongy tissue of the interior is exposed, and at its widest portion the horn is flat and sharp at the edges—like a paper cut. The rough part above the burr has been attacked and a considerable portion of the horn eaten away, leaving a perfectly smooth, flat surface. At various points throughout its length the horn bears the marks of teeth, but it appears that where it is largest the teeth of the animal failed to effect much.

This gnawing is not confined to horns, but bleached bones are often found bearing the marks of teeth. Fossil bones and fossil horns are frequently seen, which bear unmistakable evidence of having been similarly attacked when fresh. Lyell, when endeavoring to account for these marks on fossils from the Pleistocene bone caves of England, conceived the idea of introducing fresh bear bones into the den of the porcupines in the "Zoo." The result was that the bones were gnawed in precisely the same way as the cave fossils, thus clearly indicating the cause of the mutilation of the latter.

Why the rodents gnaw them has not been fully explained, but it is probable that their main object is to obtain the animal matter remaining in the bones, although it may be only "to sharpen their teeth."

We should like to hear more about the moon theory advanced by S. It is new to us.

ANTELOPE SHEDDING THEIR HORNS.

EDITOR FOREST AND STREAM:

In a note by Dr. Endlich in the August number of the *American Naturalist* doubt is expressed as to the shedding of the horn sheath in the male antelope. For several years I had been so constantly assured of its truth, by the many hunters of whom I had inquired, that I could not well doubt the fact; but it was not till December last that I had an opportunity of myself observing it.

In November last it was my pleasure to make the acquaintance of Mr. William Reed, of Wyoming, an expert and intelligent hunter, who assured me of its truth, fixing the time as the middle or latter part of December. About the 12th of the month, while hunting with him, his unerring rifle brought down from a small herd six, three of which were males, and I was delighted to find all of the latter with their new growth of horns. One of the best skulls was cleaned and sent to the Peabody Museum, and I make the following description from a re-examination of the specimen: The length is a little over six inches, and nearly straight. Two inches of the point, or that portion beyond the core, is hard and firm, but the remainder is almost completely into a softer, more skin-like appearance, and covered with long, rather stiff hairs lying close to the sheath and nearly concealing it. These hairs are pointed upward. The prong is only represented by a slight protuberance at the base of the hardened portion. The other specimens, if I recollect, had less hair upon them and were nearer developed. Mr. Reed thinks that the horns are fully outgrown and hardened by the middle or latter part of January.

I am fully convinced that the great majority of the males do thus change their horns, but whether it is invariably the case I am in some doubt. At all events such a remarkable occurrence in a caviem is worthy of special study. That the fact has been seldom noticed by naturalists is not at all strange. The region that they inhabit is seldom explored by scientists at the season that the falling occurs. The cast-off sheaths are not unfrequently found in regions where the animal is most abundant. The cause of this apparent rarity is, however, owing to their easy decomposition and the readiness with which they are buried by the spring prairie fires.

With reference to the wool in mountain sheep, I can corroborate Dr. Endlich's statement. A female killed in early June of the present year, while the animal was shedding its hair, had its flanks covered with a fine, heavy coat of wool. The flesh at that season was so strongly flavored with the wild onion to be unpalatable, and I was assured that such is usually the case in spring. S. W. WILLISTON.

For Forest and Stream and Rod and Gun.

AMERICAN VS. ENGLISH SPARROWS.

I HAVE noticed that for some considerable time controversy has been going on in regard to the advantage or disadvantage of the presence in this country of the English house-sparrow, not only as a common bird, but as a pest in the suburbs, as well as the alleged fact that they drive away our native birds from the districts in which the naturalized foreigners have settled. It is not my desire to enter into this discussion, as my opportunities of observing the birds, on account of absence from America, have not been sufficient to enable me to form an opinion, but I merely wish to describe an occurrence I witnessed a few days ago, which may possibly be of use to some one interested in the question. Around a house I now occupy, numbers of English sparrows are constantly seen, and not many of our native birds. This was easily accounted for, according to one side of the question, by the presence of the sparrows. A few days since, while sitting on the piazza with a friend, I heard a cry of distress or anger from a sparrow who seemed to be in trouble, and on looking at the place it was the place where I had seen from toward which some four or five of the birds were flying. I saw an English sparrow fighting with one of our little chipping sparrows. "Now," said my friend, "you will see them pull that little fellow all to pieces," and I expected to see his words come true, as all the English sparrows attacked the unprotected little chippy with great fury, and in a moment they were all around him, and he was fast. But, instead of this, the ball fell to pieces, and, instead of the mangled remains of the chippy, he was fighting vigorously; and, carrying the war into the enemy's country, he compelled his assailants to retreat. Not satisfied, apparently, with his victory, he selected a particularly obnoxious cock sparrow, who, with tail up and wings down, evidently had some little fight left in him, and who strutted about in a very important manner, and attacking him, drove him to a fence near by, and chased him up and down the rail for a distance of twenty feet, picking him at every jump, until the immigrant was forced to take refuge in a thick cedar near by and hide himself, thus leaving the chippy master of the field. Since then I have witnessed another fight between the same birds with a similar result, thus showing conclusively that sometimes the English sparrows get well thrashed, and that a half dozen of them are no match for one little chippy. D. G. ELLIOT.

New Brighton, Staten Island, Aug. 1877.

THE RED SQUIRREL AS A SAP SUCKER.—The red squirrel has fared badly in the hands of our correspondents. His carnivorous tastes have brought him into much well-deserved ill-repute. The following letter from Mr. R. E. Robinson, of Finesburgh, Vt., mentions a habit of the squirrel, which may be new to some of our readers:

"A habit of the common red squirrel has come to my knowledge within a year, which I have never seen mentioned. This is their tapping of the twigs and small branches of the sugar maple at the season of sap flow and sucking or lapping the sap as it oozes out. I was just told of this by an old hunter, and soon after my niece saw a squirrel in the act of nipping the bark of a maple branch and then sucking the sap. Within a few days of this I noticed the sap trickling down a maple sapling, and upon examination found the unmistakable marks of a squirrel's smooth back and tail, and a wet place extending half an inch or so from each side of the wound, as if it had been licked. So it seems our only true sap sucker is not a maligned bird, but a small quadruped. This same squirrel has become an outlaw with us for his evil practice of stealing young birds, especially robins, from the nest, a sin too great to be atoned for by his beauty and grace.

THE CYCLE OF A PARASITE.—It may be useful in order to better understand the curious circle of life the parasite travels around, to cite the following discovery made by Mr. Gale in regard to a parasite to and in rats and cockroaches. The *Plutaria rhytipleurites* are produced in the alimentary canal of the rat. These eggs are thrown out with the fecal matters and swallowed by the cockroach. The embryos, when hatched, penetrate the walls of the alimentary canal of the latter, and are encysted in fatty matter, where they await the cockroach's being devoured by the rat. In the rat they now complete their cycle. It is not very pretty nor exactly a "cycle of Calvary."

A KANSAS SNAKE DEN.—We are accustomed to give a very limited credence to the marvelous snake stories which are intermittently offered to us by the ambitious and imaginative reporter. The serpent which figures in the columns of the morning paper, with many yards of length, innumerable coils and terror-inspiring fangs, proves, when the account is sifted down to the facts, to be a very attenuated and a very harmless reptile after all. Sometimes, however, to do the much-maligned reporters credit, the snake does exist in all his pictured enormity or multiplicity, as the case may be. Writing to a correspondent for the confirmation of an account of a Kansas snake den, we have received the following:

CONCORDIA, Kan., Aug. 3, 1878.

EDITOR FOREST AND STREAM:

In reply to your inquiry I would say that there is a snake den half a mile from here, and I was there on the day it was discovered. A little boy found it, and came for me to help him kill them. I stood at the hole and killed for about one hour, and in that time killed over three hundred. Then I had to quit and go home; I gave out, and my hands were all blistered. This was in 1876, and in 1877 we killed 100; and in 1878 we killed some 1,000 or 1,000, but the first thing over 7,000, besides which hundreds were killed that I did not count, for there would be some days from 100 to 500 persons on the grounds; Sundays mostly would be the largest crowd. This year there were several boys who went down into the den and threw them out with their naked hand. The snakes were cold as ice and very numb; let them lie in the sun five or ten minutes and they could run very fast. They are rather harmless snakes. If you crowded on them they would show fight. One day in April we killed 770. I have seen, I should think, at one time, from 100 to 200 alive in a heap or pile. It was a sight to see 4,000 in one pile. People came from 100 to 200 miles to see them. They have quit coming out this year. T. R. GRAYES.

P. S.—It is no humbug; thousands will testify to it.

IGUANAS.—Two living iguanas were recently received at the Smithsonian Institution. They are a large species of lizard, *Iguana tuberculata*, and are found in the West Indies and South America. These specimens came from the island of Navaza. They are about equal in size, about two feet long, having a dark skin and a peculiar serrated or sharp-toothed ridge or crest along the whole dorsal line. Beneath the throat is an extensive pouch or dewlap, which they inflate when under excitement. They are very dull and listless in shade, but become lively and active when exposed to the sun. They live among the trees and also run on the sand and even into burrows, and swim with great activity in the water. They are omnivorous and feed upon fruits, leaves of certain plants, insects and eggs of birds whose nests they are said to search for. Their eggs are deposited in the sand along the shores of the sea, and hatch from the heat of the sun. When enraged they are very fierce in aspect, and will often attack an intruder, but become slowly retreating when exposed to a wound. Their appearance at this time is quite formidable, the dewlap distended, the eyes glaring, and the animal standing erect and threatening. They are considered a very great delicacy, and are hunted in all of the islands for food, in some of them to such an extent that they have become pretty well exterminated. They are usually taken by slipping a noose attached to a short stick over their heads, suspending them by a jerk. Where they are taken to distant parts of the island or mainland it is said they are sent alive, the mouth being sewed up or tied in such a way that they cannot bite.

HENRY HOBAN.

A GARTER FULL OF SNAKES.—*Nantucket, Mass., Aug. 4.*—*Mr. Editor:* Last Friday a man here killed a garter-snake, in the pouch of which were sixty-two little squirming serpents.

JACK COWLEY.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING AUG. 10.—One *Azara's Fox*, *Felis azara*, presented by Mr. R. J. Wheeler, N. Y. City; one Mexican deer, *Cervus mexicanus*, born in the menagerie; one African elephant, *Elephas africanus*; one common rail, *Pelecanus carolinensis*, presented by Editor FOREST AND STREAM and RUD AND GUN; two ravens, *Corvus carolinensis*, presented by Mr. Arthur J. Colburn, Boston. W. A. CONKLIN, Director.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING TUESDAY, JULY 23.—Two bird tortoises, *Testudo tabulata*, presented; one great horned owl, *Bubo virginianus*, presented; one bald eagle, *Haliaeetus leucocephalus*, presented; one red-headed woodpecker, *Melanerpes erythrocephalus*, purchased.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDENS FOR TWO WEEKS ENDING AUG. 6.—Two great horned owls, *Bubo virginianus*, presented; one gray squirrel, *Sciurus carolinensis*, presented; three beaver, *Castor fiber canadensis*, born in garden; one diamond rattlesnake, *Crotalus adamanteus*, purchased; one ground rattlesnake, *Crotalus mitchilli*, purchased; one whip snake, *Bosonotus anguiformis*, purchased; one black snipe, *Bosonotus carolinensis*, purchased; one spreading adder, *Heterodon platyrhinos*, purchased.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, BEO. N. Y. HORTICULTURAL SOCIETY.

HARDY EVERGREENS.

ON visiting almost any nursery in the country, one is struck with the large space devoted to deciduous trees and shrubs, to the exclusion, we were about to say, of evergreens. It is well known that many, if not all, of the Chinese and Japanese deciduous plants ripen their wood better, and in consequence give a better account of themselves here than in either Britain or on the Continent, but we are glad to see that some of our larger nursery men are devoting their strength to the selection and cultivation of choice evergreens, that are not only most beautiful for lawn decoration or grouping, but perfectly hardy as well. The exhibit made by S. B. Parsons & Sons Co., at the summer meeting of the N. Y. Horticultural Society, was one of the best ever brought together, and drew as much attention as even the choice roses, the floral designs, or the rare exotics. It was arranged under seven classes of

Hardy Ornamental Plants, viz.: Ornamental Evergreens; a collection of twenty-three distinct varieties of Retinosporas; a collection of twenty-seven distinct varieties of Japanese Maples; a new plant of the introduction of great beauty, *Pyrus Manley Tricolor*; the new variegated Catalpa *Syringae folia aurea*; and two collections of striking Hardy Variegated-leaved plants. Among the Ornamental Evergreens, the most noticeable were Nordan's Silver Fir, broad and massive with finely curved leaves and branches, turning up their silvery linings to the light. The Weeping Silver Fir is compact and graceful, perhaps the most regularly curved of all weeping evergreens. Euden's Bay Silver Fir is a very small dwarf variety, of a rich dark color. P. Nobilis, the most richly colored of all the Silver Firs, was represented by a very blue-green specimen, quite unique and picturesque in its form. Parsons's Silver Fir has long, exceedingly recurved leaves, whitish underneath; it is one of the most notable and rare of Silver Firs, and is also quite difficult to propagate. The Compact Silver Fir, of which a fine specimen was shown, is the hardest, and perhaps the most immemorial Silver Spruce, with the special features of Messrs. Parsons & Sons Co.'s exhibit, which is their admirable system of pruning or pinching (for it is often no more than that), whereby all formality is avoided and the plant is given the most perfect habit of which it is susceptible. The effect is natural, but at the same time almost an improvement on the intention of nature, even under the most favorable circumstances.

Among the Spruces exhibited were noted especially the Weeping Hemlock, most perfect and exquisite of evergreens; Weeping Spruce, most picturesque and characteristic, with pendent branches hugging the stem in grotesque forms; the Conical Spruce, perfectly symmetrical without pruning, and therefore on this, as well as on other accounts, deservedly popular; Gregory's Spruce, broad, massive and dwarf, a veritable overgreen hemisphere; the Black Spruce, with its neat dwarf habit and wonderfully symmetrical outlines; Maxwell's Glory of the Spruces, having an unusual amount of gold and silver markings on the leaves; the Tiger-tail Spruce, *Abies polita*, of a rich golden blue and very marked in this. In this group was also the curious Umbrella Pine of Japan, *Sciadopitys verticillata*, which grows in such rare and unusual forms. The collection of Retinosporas shown by this firm was perhaps the most complete ever exhibited at any horticultural meeting in America. "The whole group was very remarkable, indicating the utmost diversity of form, both of foliage and growth, which hardy plants are capable of assuming. Weeping plants here seem to obtain to positive exaggeration, forms fern-like, thread-like, compact, erect, and spreading. Their colors also, silver, golden, blue and green, add greatly to the charms of these evergreens, and the variety of their special markings to the American climate renders them fitted to the work of the landscape gardener to a degree not yet appreciated."

Among the delicate and exquisite hardy plants of the exhibition the Japanese Maples are as curious as they are interesting. Messrs. Parsons & Sons have been able to show larger plants this season of these, their special introductions, and consequently their beautiful and showy hardy evergreens, and their special varieties were grouped together; more, we believe, than have ever been exhibited at one time either in this or any other country. The two collections of hardy, variegated-leaved plants contained over seventy of the most remarkable cut-leaved, variegated and weeping deciduous plants that can possibly be gathered together, and include Variegated Ashes, Purple Beeches and tullez, Golden Weeping Larches and Red Spruces, etc., etc., all with the foliage presented in the most perfect manner. In conclusion, we would say that these plants are peculiarly adapted for small places, especially if restrained by a little simple pruning. As a means of producing effects in groups on the lawn, they are scarcely as yet recognized by the landscape gardener; they are gaining in public estimation every day, however, and it is this fact that made this exhibit so interesting and valuable.

HANGING BASKETS.—Baskets of living plants may easily be had in perfection, so long as care is taken to select those best suited for the purpose and location. After all, perhaps, the most satisfactory is a wire basket, which should be painted of some neutral tint, as bright colors quite destroy the effect of the flowers, which should be gay enough of themselves without any addition in the way of paint. Inside the wire work a thick layer of green moss should be put, so as to prevent the soil from dropping through, and the plants then arranged with regard to the season and place they will occupy. For summer decoration there are numberless plants that can be utilized; even some of our drooping annuals can be made to do duty, and will be found very useful. Phlox Drummondii, Sweet Alyssum, Lobelia gracilis, Maurandia, and even the morning glories and Portulacas can be used to advantage if the basket is large enough. Iresines, Centaureas, Colcus, Ivy-leaved Geraniums, Scarlet Geraniums and Nasturtiums, and a host of other plants may be named as effective, both for summer and winter use, either for their color, for their gracefulness, trailing or twining habit. For winter, more especially for halls or dry situations, the various Echeverias, Sedums, and plants of a like character, will be found very useful, and may be arranged in the sides of the basket with the taller and drooping plants on the top. A window-box, made of wood and lined with zinc, supported by four cords or wires, up which can be trained creepers, also makes a very pretty ornament for a room. The great point as regards keeping plants in baskets or boxes fresh and in good health, is to give them plenty of water during the growing season, but more sparingly in winter, and to keep the leaves clean; this is imperative. If baskets are hung high there should be some means of lowering them, which will suggest itself according to circumstances, as it is very troublesome getting up to them every morning with steps. This alludes, of course, to large baskets. For small ones, the best and really only safe plan is to take them down and dip them thoroughly, say twice or thrice a week, and let them drain off before being placed in position again. Should any of our readers wish any information on the subject, or a list of plants suited for winter or summer use, we will be happy to give him or her all the benefit of our experience.

The Kennel.

ST. PAUL BENCH SHOW.

ST. PAUL, Minn., August 9, 1878.

EDITOR FOREST AND STREAM:

I send rule which will govern at the forthcoming field trials. The trials commence Sept. 10, on grounds near Sauk Centre, Minn., the President of the Club, and other members of the committee, go up to Sauk Centre on Monday to locate the grounds, and secure them as far as possible from being shot over. They will also arrange for camp, tents, etc. The following gentlemen have accepted the Committee's invitation to act as judges on the field trials: John Davidson, Monroe, Mich.; C. J. Buller, Stillwater, Minn.; Wm. Muliken, St. Cloud, Minn. The following railroads will carry dogs free of charge to the grounds, when accompanied by their owners: Penna. Central, Erie, Atlantic and Great Western, Wabash, Great Western of Canada, Michigan Central, and all of the Minnesota State railroads. The entrance fee for any of the stakes in the field trials will be \$5. The entries for the Bench Show close on the 10th inst. Entries for the field trials can be made any time during the Bench Show. The following rules, as revised, will govern the field trials in the various stakes.

AGED POINTER AND SETTER STAKES.

Rule 1.—Managers of field trials must advertise the names of the judges before the trials take place, and in the event, from any cause, that any judge or judges are prevented from acting, then the owners of the dogs entered shall have the power to elect a judge or judges to fill the vacancies, each owner of the dogs entered to be entitled to one vote.

Rule 2.—Two dogs shall be run at a time, to be drawn by lot to the usual manner, except that no two dogs which are owned or trained by one person shall be run against each other. When two such dogs are drawn together, one shall be run only, and to with another dog which shall be immediately drawn, and the dog which was drawn and left over shall be drawn for again. If, at the latter end of a trial, it be found impossible to avoid running two dogs together which are owned or trained by the same person, it may be permitted.

Rule 3.—In this class, if dogs do not drop to shot, but remain quiet in a manner not liable to do any harm, it shall not be considered a demerit.

Rule 4.—If, in the opinion of the judges, the day is such that a dog, running from 12 m. to 2 p. m., runs under disadvantages owing to the weather, the judges may, if the owners demand it, give such dogs another trial.

Rule 5.—Each dog shall have the opportunity of making five points on game. Having made five points they shall be taken up and their positive totals for merit shall be reckoned according to the scale of points in Rule 6.

Rule 6.—Positive points of merit: For each point, 5; backing, 3. General points: Nose, 1 to 7; pace, 1 to 10; style, 1 to 5; quartering, 1 to 5; retrieving, 0 to 5.

Negative points for demerit: Each dog to count a lost opportunity to back, 3; each check, 3; breaking shot, 3; false point, 2. Two chances on birds shall put a dog out of the stake.

Rule 7.—In case of running off ties the brass shall have the opportunity of making five points on game. The case can be divided by the consent of all the owners of dogs making the tie. Should it be impossible to run off the tie the same day, they shall be run off the day following.

Rule 8.—No spectators are allowed nearer the handler of dogs than seventy-five yards to the rear. No spectator or others shall make any remarks about the dogs or judges within hearing of the judges; each person so offending shall be expelled from the grounds by the judges, who shall order the special police to eject such persons offending. No handler of dogs shall make any remarks in any way, the judges shall order such handler of dogs to desist; should he still annoy the judges, the judges shall order such dogs as he is handling, up and out of the race. The privilege of making the handler of dogs to ask the judges for information or explanation that has a direct bearing on any point, is depending such question the handler of dogs shall order his dogs in, and cease to hunt until the judges have rendered their decision. Under the above rules, the judges will only allow those dogs the maximum number of points which they do their work without the handlers going with them to show them the bird, and without muzzling or mutilation.

SUPPER STAKES.

Rule 1.—Dogs over eighteen months old shall not be eligible for the puppy stakes.

Rule 2.—All the rules for aged and single dogs on positive points for merit, and negative points for demerit, and general points, shall apply in the puppy stakes, except that a puppy shall not be given the opportunity of making five points on game, and only in running of ties, when he shall have an opportunity to make three points only.

Rule 3.—No point for merit shall be given for retrieving, and none for demerit if a puppy fail to retrieve.

BRACE STAKES.

The rules shall be the same as those for all aged pointers and setters, except that two dogs owned or trained by the same person may be run together; and that in case one dog of the brace retrieves, and the other dog does not, only one-half the number of points for retrieving shall be allowed.

The judges will be given full discretionary powers to say when a dog has a true or false point, and to allow or penalize accordingly. Also, in the case of a flush, the judges will be given discretionary power in penalizing.

CHAS. LACON.

TRANSPORTATION.—The Chicago, Milwaukee & St. Paul R. R. will return exhibitors at one-fifth full fare, they paying regular fare in going, on presentation of certificate issued by the club, and will carry dogs free both ways.

CAPITAL PUNISHMENT.

The following novel execution I myself was an eye witness to:

My father's huntsman, "Lige," was in addition to that position chief herdsman and shepherd on the estate. He fully appreciated the responsibility which, in connection with some peculiar eccentricities, made for him a reputation which was widespread. As the country, with the exception of the sparsely-settled plantations, was a wilderness, the cattle had an almost unlimited range. "Lige" never went upon one of his herds without a gun, and was therefore being fully equipped with gun and hunting accoutrements, and generally followed by several of his dogs. It was while starting upon one of these expeditions that one of the dogs committed an offence which cost him his life. He killed a sheep. Most men would have shot the dog on the spot, and ended the matter at once. But "Lige" decided instead to hang him, and in the presence of his whole pack. The place selected for the execution was the kennel, which was a large one, and generally followed by several of his dogs. It was while starting upon one of these expeditions that one of the dogs committed an offence which cost him his life. He killed a sheep. Most men would have shot the dog on the spot, and ended the matter at once. But "Lige" decided instead to hang him, and in the presence of his whole pack. The place selected for the execution was the kennel, which was a large one, and generally followed by several of his dogs. It was while

they expected something strange to happen. And well they might, as in the space between the kennels and midway between the gate and the house "Lige" had erected a scaffold, such as is used for hanging criminals. The preparations all being completed, the unfortunate dog was led forth, and to him was attached the carcass of the dead sheep, which he was made to draw, with a little assistance from the driver, who was seated on the scaffold. Then the ceremony of the execution, the other dogs were called out one by one and made to take a position to a circle around the gallows, just as well-trained hounds are made to do at the death. Then the culprit was mounted on the scaffold, the fatal noose placed upon his neck, and in another moment the trap fell, and there hung the poor beast in mid air kicking and struggling, until finally strangled to death. Whether this example will deter any more dogs from such conduct, or not, certainly sleep-killing was afterwards of very rare occurrence on that estate.

Nashville, August 8.

THE USE OF SALT FOR DISTEMPER.—*Editor Forest and Stream:* I promised some time ago to give you the result of R. G. C.'s treatment for distemper in dogs. The remedy was to give one a tablespoonful of dry table salt, to be followed the next morning with a teaspoonful of Epsom salts. These to continue on alternate mornings until a cure was effected. In both cases the dose was to be liquid measure. I supposed that a spoonful of dry salt, liquid measure, meant a spoon even full (not heaped), and I proceeded accordingly. My dog was a setter, twenty-one months old. He has always been a poor feeder, and very thin in flesh; never was sick until this time, and always lively and in good spirits. He had been

had not given him any medicine, except a little sulphur to keep his bowels open. He was entirely off his feed; had a bad cough, a discharge from nose and eyes and vomited more or less a nasty greenish matter. I gave him the first dose of salt on a Sunday morning. In about five minutes he began to vomit. I don't think I ever saw any dog so sick. It lasted about ten minutes, and he vomited up a large amount of a thin, frothy, acidulous matter, and the last part was green. He lay down for a while and then I spoke to him. He got up and began to run around and play. I then offered him his breakfast (mash and milk), and he ate all that I would give him. The third morning that I gave him the salt he rose upon his hind legs and fell over on his side, kicking and whining, and had a regular fit. I watched him awhile; he was frothing at the mouth, and was unable to spit about three times, and then he lay down and shut the door. I waited a few moments, and hearing nothing I opened the door and went in again, when he walked over to me with his old intelligent look and lay down at my feet. I took him out-doors and he had his vomit, and then ate his breakfast as before. I gave the remedy just eight days, ending with the Epsom salts. I fed him soft food, mush and milk, and he felt better. I saw about three men, but they now, has taken on flesh, weighs twelve pounds more than he ever did before, and is all right and ready for business.

Newton, Mass., July 27. L.

We think the dose given for eight alternate days too long continued, even for an adult animal, and might result in harm. The old story might be revived, of how a sick Frenchman on the point of death wanted a red-herring, eat it, and got well, and how another herring killed a Dutchman. Distemper is a most uncertain and vague complaint. A general name has been given for a score of diseases. If this cure is tried by any of our readers we should advise that care and judgment be exercised. We do not wish any dead dogs to be put to the score of our paper. The remedy, though a natural one, seems to us to be a little too heroic.

IS MUTILATION JUSTIFIABLE.—We take the following sensible article from the London *Live Stock Journal*:

Seeing several letters on this subject in the *Journal*, I would like to say a word or two both for and against docking dogs' tails and clipping their ears. There can be no doubt that the spaniel experiences great comfort from being docked, a fact which must be patent to every one who has worked or seen such animals worked in close covert, thick underwood, or among crambles, where they are often docked. The same may be said of the very great extent, hence, in this case "mutilation" is a kindness to the animal. Again, the rounding of the ears of foxhounds may be placed in the same category. Scotch terriers used to be both docked and clipped, a proceeding quite unnecessary, cruel, and worse than useless, as these dogs frequently suffered great pain when in foxes' ears, etc., and although the practice has been discontinued, it has not yet occurred had the protection which nature had provided them been left as it was formed. The English terrier, or black-and-tan, has its ears cut for no other purpose, I can see, save to hide some deformity, or to please certain morbid tastes of the fancy. The little tag of ear left on these beautiful terriers renders them obnoxious to me; for, instead of adding to their beauty, it detracts from it, and is a mark of a low degree, and is useless as well as cruel. We see at every show little dogs with cut tails, but ears left intact. These are called in these modern days fox-terriers. Now, I should think that if any part of their appendages ought to be cut off it should be their ears and not the tails, as those of them which would go to earth would be more likely to have their ears cut off than their tails. I am sure that I am not more knowing than I am, probably imagine that the fox-terrier attacks tail first, a belief I also entertain of many of those noisy little animals one sees at dog shows. We see also the woe "Yorkie" sitting on a satin cushion, with its ears thinned to please the taste of its lady owner. I should like to know how she would fancy her ears "mutilated" in the same manner as the ears of the "Yorkie" but I have no objection; in that we shall succeed; but we shall never advance them one step by faking, and I trust every judge throughout the land will set his face against it. Though the practice has been sanctioned in a manner by usage, that does not constitute a right of way with fakery and mutilators. Let them be banished from dog shows, and let us look on animals and birds that God the Nature formed them as they are, and let us see there is a poultry club formed for this very purpose, and it shall have one supporter in

STRATHBOIE.

"WHAT I CAN'T, WE CAN,"—*Editor Forest and Stream*: I have two pointer pups three months old. I was feeding them in the yard away from the kennel, and the chickens (I have a good many of them) were troubling the little fellows considerably by picking in their food. The pups put their heads together over the dish as if in consultation, after which one of them stood back and the other one ate in peace. The

one which had stepped back not offering to eat, but dashing from one side to the other, kept the chickens away from the dish until the one which was eating had eaten fully one-third of the contents of the dish, when he stepped back and drove the chickens away while the other one ate. This performance was repeated several times until the food was all eaten.

Bluffton, Ind., August 3. A. A. W.

A DOG FOR SPAIN—*Editor Kerist and Street.* We have shipped the following puppies: Liver and white marks, dog pup to F. Taylor, Orange C. H., Va.; liver dog pup to Orson Adams, Jessops Cut, Howard Co., Md.; liver with white marks, to Charles M. Wray, New York city; liver with white marks, dog pup, to Dr. Veritas, Nottingham, Prince George's County, Md.; liver and white marks, whelping pup, to Mrs. J. W. C. Bevin, Malaga, Spain, and was selected by one of Mr. B. C.'s friends at his request. We feel somewhat flattered in thinking that this is probably the first exportation of pointers from the United States to Spain, and hope that the pup will prove as staunch a friend to the old daisy as the dog is to the one that distant country. Yours truly, MURKINS KERRIS.

Muirbrick Furnace, Md., August 8.

THE SHEEP QUESTION CLOSED.—The testimony in regard to the female dog killing sheep has been so fully given by intelligent and reliable correspondents that we may now consider the discussion at an end. It takes little time to draw out the truth in such matters.

BROKEN LEGS.—A Ferrisburg (Vt.) correspondent, Mr. R. E. Robinson, tells us of an incorrigible sheep-killing bitch, which was finally expatriated to the wilds of the North Woods, where her propensities found ample exercise in deer-chasing. He adds:

I have often seen the broken legs of sheep set and kept in place by a bandage of sole-leather, having holes punched in the edges and laced on, with perfect success. Very likely the same contrivance might be used to advantage on the fractured leg of a dog.

BROM BONES—*New York, August 2.*—I claim the name of Brom Bones for my orange and white setter dog pup, by Milo (Dan-Venus) out of Fan (Dash-Fan), whelped May 21, 1878.
F. T. BONTSCOG.

WHELPS—*Goldsboro, N. C. August 9.*—My red Irish bitch Gussie (Dan-Ruby stock) whelped four dogs and one bitch on the 28th of July; sired by Joe; imported by J. C. Cooper, Limerick.
H. P. DORTCH.

Hoboken, August 4.—Eleven puppies out of the full-blooded imported dog and prize winner Joe-Jack.

VISITS—*Washington, August 12.*—My imported field trial setter bitch Livy, sister to champion Leicester, visited Arnold Burgis' Druid on the 4th, 5th and 6th instant. Puppies are all engaged, three of them by the St. Louis Kennel Club.

YACHTING AT HOME AND ABROAD.

Mr. Dixon, of London, whom it is no flattery to rank as leading authority on modern yachting, has just published a new book on yacht and boat sailing. This work, take it, is intended to be in the nature of both a supplemental one to "Yacht Designing" by the same author, as well as a more elementary exposition of the essence of the very interesting science of naval architecture. The objections of high price and too great erudition, made against his incomparable work on Design by many who have either not the leisure, disposition nor qualifications required for its perusal, cannot be brought against the new book. The author's aim seems to have been the collection, with due regard to order and precedence, of the more salient elements of naval design, called into play in planning the construction drawings of a yacht or boat; and it must be said that, with this in view, the success of his undertaking has been as thorough as can be desired. We could not point to a book of any kind, treating upon the subject as intricate in detail as the modern science of naval architecture, in which the very pilch has been gathered in a shape so presentable and comparatively unbroken as in Mr. Kemp's new work. There are two cracks, as it were, in the armor of this treatise, which are its only faults. Its attempts are too often swamped, and their utility curtailed by the weight of too much detail, the ordinary reader failing to grasp of his own accord the main principles set forth, losing the line of argument or deduction in a mass of bewildering detail. Again, in efforts made to forestall any such possibility, the authors are too apt to force the student to accept conclusions and axioms not in any way derived and explained in the works before him. He finds the matter at issue set forth in a disjointed way only, and must accept much concerning the truth or advisability of which he may justly have his doubts. No such failings can be charged against Mr. Kemp. He is in no haste to force conclusions upon his reader, and the student about the book bears in mind that there were statements of themselves, however truthful in the light of higher investigations, will not stand among that portion of the public with

whom he is dealing, and whom he desires to instruct as well as interest. We find, consequently, the first half of the book to be devoted to the theory of yacht design, a large portion of which has been reduced to written language, with many appeals to actual experience, thus doing away with the necessity of a liberal mathematical or mechanical education on the part of the reader. There is not a practical boat builder in the land who cannot readily follow the author through his train of argument; and, apart from the insight into the principles underlying naval construction to be obtained from the book, we regard this as its most praiseworthy feature.

It is often maintained that foreign words on yacht design are of no use to Americans; even more than that, they are said to be misleading. To any such opinions we emphatically protest. On the contrary, even did we have American thought and work in this line reduced to print, we maintain that the English standard works is of the greatest immediate benefit to us. The more we know of yachting in America, we have much yet to learn—very much, and in no manner can we improve so readily and rapidly than by example and experience from a nation which has developed the sport of yacht sailing and the science of design to so high a degree of perfection that the average American has no conception of it. It is all very well to resort to such cheap clap-traps as "logical" and "unlogical," but I maintain about the great "Bird of Freedom" knowing everything, and I can teach our British cousins all about yachts and yachting; but such screaming comes only from those whose narrow-minded prejudices preclude a fair and rational consideration of the matters in question. If we accept some things from abroad, it by no means follows that we must take everything and judge just as they happen to come, but that we can select judiciously and wisely. I can teach our British cousins in England and English words no logical person can deny. In the first place, the theory of naval architecture is the same, no matter what type of craft may be in vogue in different waters. To know how to find the centre of buoyancy, of effort, of lateral resistance, to understand the effects of stowage and ballast, to compute by figures or of draft, geometrically, a curve of resistance, to know the effect of the hull, of the keel, of the particular style of yacht, and of the sail, are all alike to the builders of other nations. And, pray, where are we to obtain such knowledge if not from English works?

where there is a *American* book that can teach the mechanical public as concisely and ably as the works of Mr. Dixon Kemp? Is it Griffith's sad jumble of high-sounding words and exasperating mixture of mathematical ignorance and mechanical ability? Or is it Nystrom's extemporized and purely tentative parabolic system; or Pook's comparison of the ship to a sailing machine? The *American* book we are to follow? The builder who attempts to pass through Griffith's will read one page, then throw the book aside and swear with renewed vigor by his jack-knife art. The man who follows Nystrom becomes a mere tool and moves in a rut; and as for Pook or any other author on ship construction who may have flourished unknown to the public, their books cannot any longer be obtained—a fact not to be regretted for, with the exception of Pook's "Wave Lines,"

the light of the modern developments than an old time galliot for a Liverpool liner. An English work on the theory of design is just as useful to us in America as if it had been written by a free sovereign of the republic, directly descended from the first bigot who got his shoes wet when he stepped out on Plymouth Rock from the *Majflower*. But more than this, our builders can learn much from the more practical portion of foreign works on yachts. It is not at all intimated that they can catch up with the *speed*, for a glance at the "lines" of boats published in English works is enough to show that we have little or nothing to learn from them in this respect. Even among the modern and better type of British schooners or cutters we fail to detect that symmetry of proportion and union of curves so notably the prevailing feature in American design, and directly traceable to the innate superiority of the American mechanic over his foreign brethren. With the exception of such craft as have been designed by professional naval architects abroad, there is little to be learned from the designs of foreign yachtsmen. No one here would for example think of holding up as a model such an uncouth and clumsy production as *Lionna* or even *Cambria*. We can beat their lines every time. A comparison of *Sappho*, *Danless* or *America* with British schooners, so far as grace and ease of lines are concerned, would redound immeasurably in our favor. But then handsome lines and speed are not the only things to be sought in a yacht; for is safety, ability at sea, comfort, and quality of goods for rough weather, the more important things, the more so the more the sailing and fitting gear which the English and Americans can select much that will go to improve the condition of our fleets on all these important points. Occasional reference to Lloyd's rules, Mr. Kemp's books and the like will serve to check the tendency of builders and owners on this side of the Atlantic to slight their work, and would mitigate the most serious evils from which our yachting fleet now suffers. Wherein surrounding circumstances differ and purposes vary, allowances can be made. On the whole, then, whether with a view to the standards, a close study of English works will be of vast benefit to the craft we sail and the way we navigate them.

The charge of unfairness and partiality is often urged against English authors. However true this may be of others, it cannot be sustained against those who treat of naval architecture. Among the long list of British and French authorities on this and kindred subjects, the only one we can call to mind who has allowed his blind partisanship to run away with his discretion, is E. J. Reed, formerly Chief Constructor.

R. N. In "O Iron-clad Ships" he goes out of his way to offer a gratuitous insult to American naval officers, questioning their veracity and ability. He intimates that the small roll of monitors observed by them at sea is not worthy of credit, and vehemently discourses in favor of broadside vessels. Like all radicals of that class, their own words some day turn against them, and thus, a few years later, we find him equally as energetically and illogically preaching circular ironclads of low free-board to the bewildered British taxpayer. It so happened, however, that the solid public of this country is not so easily misled, and constantly began to disagree with B. Reed, and failed to take any more stock in him. The Russian "Popoffsk" turned out only partly successful, and to the present day no power has seen the necessity of breaking up their old ironclads and rushing pell mell into the adoption of the circulars. Mr. Reed has in "Naval Science" upon more than one occasion, vented his spleen upon American designers, who, so far as genius and daring, though not matured, enterprise are concerned, were greatly his superiors, while his whole course as chief constructor evidences a gradual and stealthy adoption of the principles given to the

world when Ericson revolutionized naval warfare by launching the first monitor in 1862. On the contrary, however, there exists no ground for complaint against other authors. Cecil Russell, Rankine, Marrett, Bernoulli, Bertin and others have paid homage to the wonderful productions of the New World without stint, and Mr. Kemp, though writing on matters, close rivalry in which might offer some excuse for partisanship, shows himself a devotee of scientific truth, and a true chronicler of facts by rising above the narrow vision of national prejudice and making a bird's-eye view of yachting in the world over, with favor to none and full credit to those who deserve it. The frequent reference to American yachts, and the ready admission, when speaking of the comparative performances of *Seabelle* and *Columbia*, that:

"*Columbia* has made 12.5 miles per hour in a lower-sail breeze blowing a little abeam the beam, the wind pressure being equal to 20 lbs. per sq. foot. *Seabelle* under similar conditions has made 11.4 knots per hour."

must satisfy all that it is quite possible for an English author, while treating of English yachts, to give credit to the greater speed of our own, and that the fair spirit pervading such a book will render it of immediate service to Americans as a means of instituting comparison between the condition of yachting at home and abroad.

If we now turn our attention to a critical analysis of those conditions, we do not think the unprejudiced reader will disagree with us. It is perhaps well known to most that, while with us yachting is at best only in its infancy, it has reached a wonderful development in Great Britain, where the sport has been so thoroughly organized, and the masses of the people are so wedded to it, that yachting may fairly be termed a national characteristic, influencing in no small degree the habits and customs of many inhabitants of the nation. Such being the case, is it derogatory to our self-esteem to learn from them and to candidly acknowledge that we can do so to advantage? Certainly not—the reverse is true; for surely if behind our British possessions we have yachtsmen who can do so, what remedies we may, so that not only in one quality but in all we may be their equals or superiors. The person who would, like the clam at low water, retire into his shell, self-sufficient with what success we have attained, is his advice to be followed, and should prejudice breed progress?

What are the qualities necessary to the perfect yacht? Safety, sea-going ability, comfort, handiness, speed. How many of these are to be expected in a vessel of this size? More than those of Great Britain? The solitary one of speed. Our boats are not only not as safe as those in foreign waters, but with few exceptions they are man-traps. They cannot go to sea; they cannot stand a sea; they must run for a port, when an English craft just gets down to her bearings; they are hard on their helms, hard in a seaway, low between decks, unsteady and uncomfortable in a mill pond, and their rig is unsightly and dangerous; they are fast—very fast—but only in smooth water. On the contrary, the English craft beats us on all points but speed. When we want to travel fast we can take the cars. Is there not some object, then, in sacrificing speed to a very moderate extent to obtain all the other desiderata? Certainly those who take to yachting for other purposes than racing altogether will probably not think it worth while to enter the arena. The parent of the many superior qualities now lacking in our fleet, why we should not select a vessel approaching to that type in use in England, which has stood the test of time and experience on all these points, and the introduction of something like the cutter into our waters we hail with delight as a sign of progress in the right direction; of seamanship, navigation, and the spirit of adventure accompanying it. The time when we were wont to phrase "The cutter is not suitable to our smooth water." And since when is our water invariably so smooth? Are yachtsmen always to remain content within the narrow confines of the Sound, or is the sport likely to branch out and take root in every port along the coast? What, then, becomes of the smooth waters of the Sound and the June zephyrs? When you get caught in a gale off shore you may find the value of a steamer for your feet. And does it never blow? Is there no sea on outside the Sound. In short, are not the circumstances surrounding our yachting changing, and should not the type of yacht be altered to suit the change. Those whose ambition carries them no further than the Sound may well declaim against the cutter; those who want to get off soundings occasionally will do wisely to adopt it; the yacht should be suitable to every sea, smooth or rough, sailing or beating, and means stick to the sloop; but when we propose going to sea, give us a boat we can trust our lives in; we want no *Mohawks* then. That there are in our waters vessels well adapted to take the sea is true. They are unfortunately the exception, and the above remarks refer to our yachts as a class. The ordinary sloop has been found wanting in the rougher waters of San Francisco, where the built-up vessels differently from the skimmers of the Sound. How much more, then, do we need an abler craft to go to sea in here? A fleet of cutters is destined to appear ere long in our waters, and to that the fossilized sticklers for the smooth-water sailing machines may make up their minds at once. If they do not think so they simply cannot read the signs of the times. We want yachts that shall have something more than speed alone. We want yachts that shall make our floating home. We want yachts that can sail from the Race to the Key. They must be well built, strongly built, rigged in sailor-like fashion, fitted out with the same care bestowed upon a frigate, and able to ride out a gale in perfect safety, and with ease to themselves and those on board. Until we have such craft we must grant superiority to British yachts on every single point but speed. We have much to learn from English yachtsmen, and the sooner we set about acquiring their perfection in the arts of seamanship and navigation the better.

YACHTING NEWS.

CAUSE OF THE ATLANTIC YACHT CLUB.—The fleet of the Atlantic Yacht Club having assembled in Glen Cove Saturday and Sunday, an early start was made Monday morning, August 6. Orders had been issued to the captains from the flagship *Triton* to the effect, that New Haven was to be the next harbor to make. Accordingly the fleet here shortly and got under weigh at 6:45 A. M. Wind fluky and sky overcast, with the tide half ebb. The yachts hoisted light sails, *Orion* sporting a huge club topsail and balloon jib. All hands drifted out of the harbor the best way they could in the fitful catpaws, coming from all directions at intervals. Commodore Cooper's sloop led the way, followed by *Thistle*, *Intrepid*, *Sheila*, *Alma*, *Dolphin*, *Triton*, *Imperia*, *Vision*, *Hope*, *Genia*, *Agnes*, *Peelless*. A moderate breeze from the Long Island Sound, and *Dolphin*, having kept well to windward, was the first to benefit by it. At about two bells in the forenoon watch the wind came out steady

from S. S. E., and brought up the rack of schooners and larger sloops with it, but the breeze failed again. *Peelless* and *Vision* in the mean time had duly put her helm to leeward in expectation of something from the Connecticut side. They caught a fair streak and ran away from the rest, with only *Dolphin* and *Orion* ahead, and, tacking off the north shore, stood down again on the port tack for their regular course, followed by *Agnes* and *Triton*. The former got into the doldrums and fell astern, caught by the flood running on the Connecticut shore. *Orion* had worked ahead of *Dolphin* and led the fleet off Eaton's Neck. The breeze freshened and *Triton* began to make a better showing. She passed the sloop *Vision* and hauled up on *Peelless*. The latter got an extra puff and took the lead among the schooners in fine style. In the afternoon the wind once more fell light and suddenly chopped around to the S. W., coming out in wholesale fashion. The fleet now has a leading wind right into port. Balloning and sailing, *Agnes* and *Orion* were the first to go again among the leaders, and without further incident the squadron finally comes to an anchor in Morris' Cove, at the mouth of New Haven River, in the following order: *Orion*, 6h. 35m.; *Peelless*, *Agnes*, *Thistle*, *Triton*, *Dolphin*, and the rest at longer intervals. The morning of August 6 broke overcast and foggy, but with quite a breeze from the S. E. On the whole, the day was not a success, as the wind decided to make a start for New London. Though it would be a turn to windward all the way, the distance was not great, and it was expected the fleet would make the old whaling city by the evening. *Imperia* led out of the harbor, followed by *Peelless*, *Agnes*, *Vision* and *Thistle* in a bunch. *Orion* carried her big topsail as the day before, but when fairly outside was obliged to send it on deck, a move followed a while later by *Triton*, whose topsail would not sit jammed on the mast. Sheets were hardened in to starboard, the whole lot, standing across to the Long Island shore. At times the fog shut down so dense that it was impossible to keep track of the yachts. *Orion* attempted a short board to the N., but soon came about again. The wind freshened and put lee rails under. *Agnes* was first to try for the Connecticut shore, but *Peelless*, *Agnes*, *Vision* and an excellent wind and outwinded the fleet, *Orion* and *Imperia* of her wake. *Peelless* about a mile in her wake. Mr. Maxwell's graceful schooner, however, turned tables on *Triton* and came out on her weather after several boards had been made. The craft that can put *Peelless* under her lee and hold her there must indeed be one of the best two-stickers afloat. Toward evening the breeze fell and the fog again shut down, necessitating a good deal of guesswork as to the whereabouts of *Triton* led past the Barrett's Reef ship, and with a light air bore up for the harbor, followed by *Thistle* and *Dolphin*, the latter's time being 7h. 7m. The remaining yachts made their anchorage during the night, *Nomad*, *Myra* and *Intrepid* having parted company and borne up for Greenport direct. New London is an excellent place to "provision up," her markets afford the best from the surrounding country, and prices are reasonably not at all exorbitant, considering the place is situated to the utmost. In consequence the old town has become quite a favorite place with yachtsmen to replenish their stock of soft tack, fresh grub and ice. The Atlantic fleet did not miss the opportunity, and purposely delayed making sail for their next rendezvous until 9 A. M. At gun-fire from the *Triton* all hands got under weigh promptly, and with free breeze and good wind the fleet sailed. *Sound*, *Orion*, *Vision* and *Agnes* were the first to get under weigh, followed by *Peelless*, *Agnes*, *Dolphin* and *Hope* set balloon jibs, but the others sloops contented themselves with jib topsails. Off the Pequot House *Peelless* was picked up, and *Triton* sent aloft her main topsails staysail. Outside the wind freshened and hauled a bit, so that sheets were trimmed flatter. It fell again, though, and came out from the S. W. putting the fleet on the starboard tack, heading for Plum Island. When near the "cut" it was found impossible to lay a single leg through it, and, as the tide runs through at a lively rate, it was deemed best to avoid a tedious beat and make for the passage to the eastward of the Little Guil. *Triton* led through with *Peelless* following. Once inside of Gardiner's Bay, it was a beat up to harbor in a light wind and ebbing tide. The flagship parted some of her gear and the sails of *Peelless* were patched from her. The lead had so well maintained on the harbor services, that many short boards the anchorage was made by *Orion* at 2h. 5m. 30s.; *Thistle*, 3h. 1m. later; *Peelless*, *Agnes*, *Dolphin*, *Triton*, *Genia*, *Nimbus*, *Imperia*, *Vision*, *Hope*, and *Intrepid* in the order named. In port were found *Mela*, *Sadie*, *Nomad*, *Intrepid*, *Myra* and *Alma* making a fleet of over twenty sail, flying the well known burgee of the A. Y. C. at their mastheads. The New York yacht squadron have the harbor in the evening, and the congregation of yachts in the snug harbor of Greenport was immense and something to delight the heart of every nautical amateur. Pyrotechnics were indulged in at the Manhasset House ashore and aboard some of the yachts. Fireworks aboard ship are evidently out of place, and the custom should be done away with. It is dangerous, dirty, and snuffs altogether too much of the small boy. The morning of the 8th broke clear with a brisk wind from the West, and an outlook for a fine race was exceedingly favorable. The conditions and course of the match held by the Atlantic Club on that day have been given in a previous issue of the *FORER AND STREAM*, and need not here be repeated. *Orion* did not start, and so the match was robbed of one of its chief attractions—a tussle between her and the famous Boston *Thistle*—the New York yacht squadron having taken a party of ladies out for a cruise instead. *Genia* was the first to pick up her berth for the start, fouled *Peelless*'s headbooms, snapping her boom and ripping her mainsail, which put her racing out of the question. *Thistle* had been on the way and came off with a clean bottom, ready to show that it is not always the handsomest craft that can sail. The start was effected at 10h. 50m. A. M. In the first-class *Sadie* and *Thistle* got off together, and *Dolphin* led the second class. *Peelless* was the first to cross to the second on the starboard tack, and a turn home. *Thistle* hauled round the mark first, *Sadie* three minutes later. No change to second buoy. From there it was *Thistle*'s game, and she had the race in her own hands. It takes something pretty smart to turn to windward with this crack. In the second and third class a fine race was made, the *Thistle* wins in many well-known sloops. A summary is *Thistle* wins in first-class in 3h. 35m. 07s.; *Jove*, second class, in 3h. 60m. 20s., beating *Imperia*, *Hope*, *Sheila* and *Storm King*. *Flora* wins in the third class in 3h. 64m. 20s., beating *Nimbus*, *Viking*, *Intrepid*, *Myra*, *Telephone*, *Spray*, *Daisy*, *Alma* and *Mab*. In the evening a grand ball was given at the Manhasset in honor of the visitors; and was humorously attended. The last day of cruise, August 9, brought a white, hazy, foggy day, and the wind was so light that it seemed at last a chance of testing the craft and crew in anything more than a mild zephyr. The wind was none too much for an English five or ten, yet the number of yachts

that were compelled to remain at their moorings in Greenport, pretty conclusively shows that even among the most well-equipped of yachtsmen a large score of instances must be excused when sailing the flat-bottomed craft through a breeze and sea is concerned. At the commodore's gun only *Triton*, *Peelless* and *Petrel*, schooners, and the large sloops *Dolphin*, *Imperia*, *Hope* and *Genia* hove up for a run across to Newport. As this would bring them fairly outside of the mill-pond, and for once put the craft on the briny bosom of the sea, grand old *Thistle* and the smaller fry did well to remain snugly riding to an anchor in a safe harbor. *Genia* had "fished" her shattered boom in good style and was ready to start with the rest. The New York Squadron had left for New London the evening previous, and no difficulty was found in working out of the harbor. Fortunately for the fleet it was a free sheet all the way across, or one might have some spar broken or general smashing up to record. *Imperia* led the way, followed by *Triton* and *Peelless*. *Peelless* "winked out," but the rest kept beams to port. The little *Mab* was passed in Gardiner's Bay on her way back to New York. *Dolphin* carried a small jib-header, the only one in the fleet. *Triton* ran through the lot in the heavy breeze, and the *Petrel* showed good speed off the wind. When *Peelless* finally passed her, *Petrel* jammed her help down and the schooner's weakness was again in good evidence. *Genia* in her way that would have been more service in a shorter run. As it was, the *Peelless* dropped the other schooner after a while and went into second place, setting her jib topsail, an operation followed by *Triton* in the lead. The sloops were now some distance astern, and feel the breeze and swell. *Imperia* hauls down a reef and *Genia* runs by her. The schooner set more sail and *Triton* continued to increase her lead. The sea came on a more boisterous wind, and fairly outbats *Peelless* with sheets filled. Watch Hill was under the beam by half-past nine o'clock, the fleet having made twenty-five miles by this time, and that against a strong flood. The schooners hauled up a bit and trimmed in to port, taking in some canvas, as the wind had increased to a young gale. Course, E. by N. $\frac{1}{2}$ N. Before the Judith Light Lighted buoy was reached the wind was so strong that the sloops indulged in the by the yachts as they beat the heavy swell of the Atlantic. Had the wind been from the E. they would not have fared so well, and it is a question whether they would not have to cut and run. When fairly off the Point, *Triton* lowered mainsail and got it over to starboard. A nasty, short sea was met with as she run into slower water, and the violent pitching of the craft, no doubt, convinced some that a square-rigged model is not exactly the best for a small craft. *Peelless* made the inner harbor by the north channel, the *Triton* passing in at Fort Adams. About half an hour later *Petrel* fetched in, followed by *Dolphin*, *Imperia*, *Genia* and *Hope*, under reefed canvas, came to about two hours later. In Newport harbor *Undine* was met, sailing under the Atlantic colors. It was resolved to disband here and allow the yachts to follow their individual bent. The Commodore came on to the most successful and brilliant cruise of one of our most enterprising and go-ahead clubs. Both the officers of the occasion and the individual members are to be congratulated upon the consistent manner in which the programme was carried out.

MANHATTAN YACHT CLUB.—The third regular annual regatta of this club is to come off at Cohasset, Mass., Aug. 24, for prizes presented by gentlemen of that city. Open to all yachts not over 28ft. long. Centreboards divided into three classes, yachts measuring over 21ft. and 17ft. and under 17ft.; 15ft. and two classes, 14ft. to 20ft. and under 21ft. Speed classes for boats 14ft. and under water. No restriction as to sail in first class centreboard and both classes of keels and special class. In other classes only regular plain sail allowed. Crews, one man for every five feet and fractional part thereof. No trimming by dead weight. Protests to be made within an hour after the race. This is a good rule as it insures their consideration while matters are still fresh in the minds of all concerned. Start from an anchor. Entries to be made to J. P. Hawes, Jr., 103 Mill street, Boston, before 3 P. M. Aug. 23. Prizes in cash from \$40 down. Second, third and fourth prizes only in case three, four or five boats start. Regatta Committee: T. Daland, J. P. Hawes, Jr., C. G. Weld, Patrick Grant, Jr., and W. C. Haskell. This is the second annual regatta given this year by the Manhasset Club, and a large list of entries is expected. Nearly all the yachts will be sailed by Cornishians, and the feature will add much to the value and interest of the meeting. A full view of the match can be had from the shore between Atlantic House and Kimball's on Pleasure Beach, Cohasset.

SWEEPSTAKES MATCH IN GOWANUS BAY. The sweepstakes race in Gowanus Bay, South Brooklyn, was started Aug. 8, and proved a very interesting affair. Course from Frank Bates' Club House to Robbins Reef buoy, thence around Fort Lafayette and home, sailing twice over. Distance, twenty miles. The course was marked by the course judges and the catamaran *Victor* figured as "press boat."

The starters were as follows:

Name.	FT. IN.	Owner.
Excelsior.....	21 10	J. H. Binks.
Addie.....	21 10	Wm. Taylor.
J. Saunders.....	21 10	Wm. McMillan.
George B. Dean.....	21 11	Chas. Swinark.
Sophia.....	21 11	John A. Volant.
H. H. Hayes.....	21 11	Wm. A. Kreymer.

All of them cracks that have figured in many a water before. Tide about half flood, and wind brisk from S. W., making it a dead beat to the first mark. *Saunder* led across the line, with the fleet standing off on the port tack. The first mark was fetched in excellent time, the whole lot working to windward in fine style. With beams to port, they made for the second mark, with *Saunder* in the van, and *Thistle*, *Imperia*, *Taylor* and *Dean* following. *Excelsior* had been picking up somewhat, but suddenly capsized, probably owing to dropping some of her sand bags to windward. *Sophia Emma* followed suit in an attempt to jibe. Her crew was picked up by the catamaran and the yacht towed in to Bates'. The first round was made, with *Saunder* leading, *Addie Taylor* second, *Imperia* and *Dean* astern. On the beat back picked up considerably by windward, *Imperia* and *Dean* with the *Taylor*, went to the front, *Saunder* dropping into third place. The two leaders had a close thing of it all the way around, but the *Taylor* beat her own, and finally crossed the line winner in 3h. 43m. 25s., *Dean* 5m. 25s. later, *Saunder* third and *Holmes* last.

PRIZES AWARDED.—The New York Bay Regatta Committee have finally awarded the prizes to the winning yachts. First prizes, \$45; second, \$11.92. A champion pennant has been given to the winning boat in each class and a silk pennant to the winning crew.

LARK TAYLOR.—Civic holiday, Aug. 2, was celebrated at Belleville, Ont., by a yacht race among the first, second and third class craft. *Davies* and *Malasp* were the only

where the channel was. He said Jersey, so Jersey we went; but we soon found that he was mistaken, for before we had got half way through the rick the *Spry*, which was leading by about twenty yards, struck on a rock and the *Arrow* not being able to steer clear of her, on account of the force of the current, threw her bow on as not to strike the *Spry*, broadside, and struck her sideways. Both canoes rolled over on their sides and the water ran over us as though nature had placed us there to make a waterfall. By the aid of our oars we were barely able to keep ourselves from being swamped. After getting our canoes half full we gradually worked our way into deep water and after going on a short distance hauled our canoes out on a raft, baled the water out of them, dried ourselves as much as possible and lunched. Thus refreshed we launched our canoes and made more and passing through Boston Falls in safety arrived at Phillipsburg. Our friends at Delaware Station tried to persuade us not to go down the river in our canoes as it had fallen nearly six feet after rats had stopped running and it would be very dangerous to go through the rapids and more so as we did not know the channel. But we had made up our minds to give the canvas canoe (Qui Vive) a thorough trial, and we did. Having plenty of rough water, as well as strikers about 25 times on the rocks between the Water Gap and Phillipsburg we found them to be all we could possibly desire. Reaching our 'yas we started down the canal, camping the first night just outside of Phillipsburg, in order to make an early start the next morning. We passed through Stanhope Lake at sun set, which was a beautiful sight, and arrived at Lake Hopatcong that night and camped in the "old spot." Leaving the lake at 4 A. M. the next morning we arrived at Dover before noon. In passing through this town we were hailed by a gentleman on the shore who said he had read a good deal about the canoe in the *FOREST AND STREAM* and nothing would do but he must examine them in from bow to stern.

Continuing on our way until 10:30 P. M. we arrived at Paterson, where we accepted an invitation from a canal man to bunk in with him on the canal boat and had a comfortable night's rest, for after paddling all day a person gets pretty stiff by sleeping in a canoe. After breakfast we bid our friend good morning and started for Bloomfield, where we arrived at 10 A. M., making the distance from Phillipsburg to Bloomfield, about 91 miles, in two days and two hours, paddling the whole distance. We arrived in Orange on Decoration Day in time for dinner, feeling better than we ever had before, being perfectly satisfied with our trip and feeling that we had thoroughly enjoyed ourselves and fully paid to test the merits of the Qui Vive canvas canoe.

East Orange, N. J., Aug. 1, 1878. P. P. and E. P. D.

Sea and River Fishing.

FISH IN SEASON IN AUGUST.

FRESH WATER.	SALT WATER.
Trout, <i>Salmo fontinalis</i> .	Sea Bass, <i>Morone oceanalis</i> .
Salmon, <i>Salmo salar</i> .	Sheepshead, <i>Archosargus probatocephalus</i> .
Lantern-trout, <i>Salmo confinis</i> .	Striped Bass, <i>Morone tennesseensis</i> .
White-fish, <i>Salmo gairdneri</i> .	White Fish, <i>Morone americana</i> .
Grayling, <i>Thymallus tricolor</i> .	Weakfish, <i>Cynoscion regalis</i> .

Yellow Perch, <i>Perca flavescens</i> .	Boat, <i>Carpa gibelius</i> .
	Kingfish, <i>Menticolus americanus</i> .

FISH IN MARKET.—Retail Prices.—Bass, 25 cents; bluefish, 8; salmon, 25; mackerel, 15; weak fish, 10; Spanish mackerel, 20; green turtle, 10; halibut, 12; haddock, 6; king fish, 20; codfish, 6; black fish, 10; donders, 10; porgies, 8; sea bass, 15; eels, 15; lobsters, 10; sleepers-head, 8; Canada brook trout, 35; pompano, 25; hard crabs, per 100, 85; soft crabs per dozen, 81.

NEW BRUNSWICK.—*Bathurst, August 3*.—Good catches of salmon and grilse are now made every day at the rapids near the Nepisiquit River. This stretch of water is a very desirable one for that class of sportsmen who dislike long canoe voyages. It is scarcely three miles by a good road from the Wilbur House, where good board can be had for \$7 per week. The guides' charges are from \$1 to \$1.25 per day. Plover and goose shooting are good later in the season. Our catch, myself and friends, at the rough water to-day, numbers sixteen. Weight not given. STANSTAD.

NEW BRUNSWICK WILDS.—*Camp in the Wilderness, York Co., August 3*.—It is three months since I left the verge of civilization for life in the woods. Trouting has been excellent, the fish large and gamey. Now the water is warm and the fish languid; and the fish are so few that I can only say that I have been made pleasant by the many acts of courtesy and visits of John Stewart, Esq., Superintendent of N. B. & C. R. R., a whole-souled man and thorough sportsman, whose camp on the beautiful Killbuck is at the service of any lover of the angle. The prospect for partridge and duck shooting was never better. Bears, the usual adjuncts of camp life in the backwoods, are not plenty this season; still I took two into camp yesterday: one, a cub, will furnish the principal dish for our evening meal to-day. Allow me, in conclusion, to say a word in praise of Orvis' flies, which have proved to be the best I ever used. CORPORAL LOT WARFIELD.

QUEBEC.—*Matapedia, Aug. 6*.—The weather here is dark and heavy, with strong east wind and water in the Restigouche high and unfavorable for salmon fishing. The only salmon killed here for some days past. I took one to-day, two in number. As soon as settled weather comes and the water falls there will be good fly fishing again. Yesterday I visited Parker's Lake, a few miles back from Campbellton, N. B., where I basketed 54 fine *Salmo fontinalis* ranging from 4 lb. to 2 lb. each. STAMSTAD.

NEWTON TROUT.—The trout on the Nepigon this season is reported to be the very best. The fish average one and a half pound in weight, and give plenty of work to the angler who seeks to draw them out on to dry land. By a fortuitous survival of the fittest, the smaller and weaker fish are all devoured by the picker, so that your hook is not molested by fingerlings.

NEW HAMPSHIRE.—*Georgetown, August 5*.—Steamers run daily through Lake Mimpheengog, making connections with the Vermont Central, Southern and Passumpsic railway, stopping at all points on the Lake, including the beautiful village of Georgetown, which is the abode of the sportsman. Within three miles distance from this place there are between twenty-five and thirty good fishing grounds, where great quantities of lunge (a fish of excellent quality, averaging from five to twenty pounds) are caught. But the greatest of nature's curiosities in this country is a living stream of water one mile in length and half a mile in width, which is situated on the very top of Mount Alaphontum. Great quantities of

spotted trout are caught there yearly by sportsmen from New York, Boston, etc. This pond is situated on the Western side of the lake opposite Georgetown, at a distance of three and a half miles, and accessible by means of a carriage road, that has lately been constructed from the shore of the lake to the outlet of the pond. For fly-fishing this pond cannot be excelled. D. W. A.

MASSACHUSETTS.—*Nantucket, Aug. 10*.—Bluefish are very scarce, the heavy wind having driven them off shore. JACK OURLIEV.

MOVEMENTS OF THE FISHING FLEET.—The latter reports from the Bay indicate an improvement in quality and catch, and it is not too late to hope for profitable returns before the season closes. The weather has been rough of late, and unfavorable for fishing, but some good fares are reported. The shore mackerel fleet continue to meet with ill success, and there is little hope for improvement until the mackerel turn southward in the fall. The number of arrivals the past week has been 12 and the receipts some 600 bbls. Bank and Georges fish have been in moderate receipt the past week. We notice 9 arrivals from the Banks, with 400,000 lbs. codfish and 112,000 lbs. halibut, and 26 from Georges, with 340,000 lbs. codfish. Whole number of fishing arrivals for the week, 43.—*Cape Ann Advertiser, Aug. 9*.

RHODE ISLAND.—*Newport, Aug. 10*.—Bass are being caught from the noted points every morning. The sea, being rough, keeps the water stirred up just enough to please the fishermen. Bluefish are running rather small at present, but fine sport is had trolling for them.

CONNECTICUT.—*Wolcottville, Aug. 11*.—Black bass fishing is middling good at Bantam Lake, Litchfield, Conn., and many fine strings are also, I am told, captured at Warama Lake, in Kent, Conn. Why it is that bass do not bite at West Hill Pond, (plenty in it) or Twin Lakes (Salisbury, Conn.) is a mystery. Cannot some of your readers explain? Pickerel and perch are in abundance in Tyler Pond, Goshen, Conn., and Wilson's Pond, Hartwinton, Conn. *K.

CONNECTICUT.—*East Hampton, August 1*.—A bass was caught at the Lake by Uncle Jed that balanced the scale at 44 pounds. The largest one thus far this season. H. C.

NEW YORK.—*Onondaga Lake*.—Black bass are more abundant in the lake than they have been for years before. Sport is excellent. Mr. John Mann, of Syracuse, recently captured a five-pounder.

ADIRONDACKS.—*Blue Mountain Lake, Aug. 10*.—This region has recently experienced almost a deluge. For more than a fortnight rain has fallen more or less every day (generally more). The waters of this lake at present writing are higher than for many years at this season. Most of the hotels in this region have done a thriving business this season. Both houses here—the "O'Leary" and "Holland's"—have at times had all they could entertain. The long-continued rains have driven many camping parties to the hotels for shelter, though more have braved it out and are still in camp. The high waters have put at a quietus on the fishing for the present, but a few days of fair weather will make all right again. G. M. S.

SHARK FISHING IN THE HUDSON.—Last Sunday afternoon two fishermen at Verplanck's Point, on the Hudson River, about half a mile from shore, found themselves unable to haul up one of their fishing-nets, which assumed more weighty proportions than they had ever known before. Assistance was speedily summoned, and a fierce encounter was had with what old fishermen say is one of the largest sharks ever caught in the waters of the Hudson. For a time it seemed a question whether a larger force would not have to be called to complete the capture. Finally, the victim was hauled to the shore, causing no little excitement among the fishermen and citizens of the surrounding country. It measured nine feet and weighed between 500 and 600 pounds. It was a female of the black species.

LONG ISLAND.—*Sayville, Aug. 12*.—Bluefish are very plenty in Great South Bay now, and have been most of the season. The catch on Saturday was 100 to 150 a boat. Commencing this has become a regular institution that an enterprising boat has a floating mill near the fishing grounds in which he grinds the bunkers. Weak and kindfish are also quite plenty on the reef opposite Sayville. The liberal management and fast trains on the L. I. R. R., under Receiver Sharp, has added greatly to the popularity of the south side this season. Ten and twelve cars to a train are often required to seat the passengers. E. K. W.

NEW JERSEY.—*Kinsey's Ashley House, Barnegat Inlet, Aug. 10*.—Sheepshead still very plenty. A Purvis took 47 in one day; another gent 32. An average of 225 taken daily. Bluefish running about two pounds are taken daily. B. G. Fallon & Brother, of New York, 56 in two days; P. W. Parsons and J. M. Heskell, Philadelphia, same number; W. R. Flynn and party, from Bordentown, N. J., 120 weakfish. Although we have no warden in our county to carry out the laws passed last winter, still some thirty per cent. of our net fishermen have refrained from using these nets out of fear. We feel the benefit. All kinds of fish are more plenty than they have been for years. Our laws are violated, however, by a large class, owing to the laxity of our State Commissioners in not appointing a warden. B.

SHAD IN AUGUST.—*Red Bank, N. J., August 6*.—I procured a fine shad to-day, a female, not spawned out. Is not this late for a roe-fish? A. H. WILD.

We think it very late for shad. But we have before this asserted the fact that in and around New York shad can be caught when wanted, almost every month in the year; of course in small quantity.

PENNSYLVANIA.—*Greenville, Aug. 12*.—James Hunter, of this place, has caught sixty-five black bass since the law went into effect. Prof. Robt. of Thiel College, of this place, caught a splendid pike of about 73 pounds. Pike fishing is splendid here. There has been several caught, varying from 7 to 20 pounds in weight. BNOOKS.

INNOCENTS ABROAD.—A party of Washington gentlemen have taken unto themselves this happy name, go off each year on a fishing and sailing cruise in their yacht *Pert*, and always manage to have a thoroughly good time. The party this year consists of Major C. A. Appel, President; Hanson E. Weaver, Secretary; William H. Goods, Treasurer; Dr. E. T. Schaffert and Ernest Schmid, Executive Committee; L. Stoddard, Sailing Master; and DeW. Haines, Joseph L.

Pearson, O. T. Thompson, Henry Bradley, Bryon Turner, Millard Wenter, and Warren C. Stone. They sail next Saturday from Alexandria, Va., and are to be gone sixteen days. They will proceed to Cherrystone, Virginia. Four miles from the ocean, spending there four days in fishing. From that place they will go to Fortress Monroe, Newport News in Hampton Roads, and all places of interest in that vicinity; then proceed leisurely up Chesapeake Bay, stopping at East Plantankank and Rappahannock Rivers and Sheepshead Rock, or Point Lookout; trout grounds at Ocean river (not Bone), and trout and taylor grounds at Sedge Pond, mouth of Saint Mary's River. They will then visit Marshall's and Adams at Saint George's River and at Piney Point.

MICHIGAN.—*Detroit, Aug. 8*.—H. Dickenson and T. McGraw returned from St. Clair Falls yesterday with over 300 bass for two weeks fishing. They took 97 in one day. DRUID.

MICHIGAN GRAYLING.—*Bay City, Mich., Aug. 9*.—Editor *Forest and Stream*: I have read a great many letters inquiring about the recreation and sport offered in North Michigan, hunting and fishing. I make one answer to many who wish to know if it is worth the trouble of coming to this place. Yes, July 19, 1878, I caught in the main branch of Ansober River a grayling 13 inches long. After removing the intestines he weighed 13 pounds—as fine a fish as any man could wish to catch, and game to the last. The grayling is more elegantly formed fish than the trout. He has a smaller head and mouth, is broader across the shoulders, and tapers off more rapidly to the tail, which is considerably larger than that of the trout, and the pupil much more elongated than that of the trout, the side toward the nose being drawn out to an acute angle. The opposite side is less acute. The back fin is very large. (Here is the exact comparison.) It has twenty-three spines; the ventral fin has sixteen; the pectoral, ten; the anal, fourteen, and the tail eighteen. He sometimes grows to the weight of about three pounds, though one of a pound and half is considered a good specimen. They are often caught with fly. They are the grayling, and no doubt of it. One word more. There is no other as good and practical way to reach them as via J. L. and Saginaw R. R. from Bay City, Mich. Those who write me and enclose postage I will cheerfully answer, but those who do not will hereafter remain unanswered. There is no sport equal to this in our whole country. And one more thing. Grayling fishing is hard work unless you know how, or have an attendant who may instruct you. C. Babbitt, of Grayling, Mich., has boats, etc. He can tell those who wish to know just what a trip down the river will cost without extras. T. C. PHILLIPS.

THE GRAYLING.—The grayling season is now at its best, and many parties of anglers are on the famous streams of Michigan. Others are fishing out. One of the most famous streams is the Manistee. A letter from Mr. Thomas T. Bates, of the Grand Traverse Herald, printed at Traverse City, the terminus of one of the branches of the Grand Rapids and Indiana Railroad, writes:

"I breakfasted this morning off as fine a mess as I ever saw. Two men spent a day and a half on the Manistee and brought back about 100 pounds. The Manistee is the 'boss' grayling stream. You can reach the stream as well and better, from the lake, from this point than from Bay City. We can take boats on here, and keep teams with us so that we can camp up or down the stream with tents, boats and all by land if we choose. This may be of service to us, for if we want to run down the river from camp, 10 to 20 miles by boat, the team could meet us at night and carry us back to camp, five to seven miles, by land (the river runs about three or four miles to one), or if we wanted to go up stream in the morning and make camp by boat at night, the team could start up off O. K. A small party is going out next week in this way. Then, too, we can take in a bass fish in some of our lakes and try the trout also."

The grayling season extends into October.

A NEW TROUT AND BASS GROUNDS IN WISCONSIN.—The following letter was addressed to the editor of this paper by Mr. J. W. Munson, of St. Louis, who is now in Wisconsin with his family. We are pleased to have such satisfactory reports from so reliable a source:

My Dear Mr. Hallowell: When I left you at Trout Brook bridge last Friday, on your way to Madison, my wife and I waited on the side of the railroad only long enough to watch your train over the bridge, when, with our guide, we plunged into the forest, and following a tolerably well defined blazed trail, from this point then from Bay City. We can take boats on here, and keep teams with us so that we can camp up or down the stream with tents, boats and all by land if we choose. This may be of service to us, for if we want to run down the river from camp, 10 to 20 miles by boat, the team could meet us at night and carry us back to camp, five to seven miles, by land (the river runs about three or four miles to one), or if we wanted to go up stream in the morning and make camp by boat at night, the team could start up off O. A NEW TROUT AND BASS GROUNDS IN WISCONSIN.—The following letter was addressed to the editor of this paper by Mr. J. W. Munson, of St. Louis, who is now in Wisconsin with his family. We are pleased to have such satisfactory reports from so reliable a source:

My Dear Mr. Hallowell: When I left you at Trout Brook bridge last Friday, on your way to Madison, my wife and I waited on the side of the railroad only long enough to watch your train over the bridge, when, with our guide, we plunged into the forest, and following a tolerably well defined blazed trail, from this point then from Bay City. We can take boats on here, and keep teams with us so that we can camp up or down the stream with tents, boats and all by land if we choose. This may be of service to us, for if we want to run down the river from camp, 10 to 20 miles by boat, the team could meet us at night and carry us back to camp, five to seven miles, by land (the river runs about three or four miles to one), or if we wanted to go up stream in the morning and make camp by boat at night, the team could start up off O. K. A small party is going out next week in this way. Then, too, we can take in a bass fish in some of our lakes and try the trout also."

The grayling season extends into October.

from the pine trees around it, and I thought perhaps it might have something to do with the color of the fish. They seem to be an individual species—so far, at least, as size is concerned—for no one that we know of has ever caught one in the lake larger than about a pound, and smaller ones are very rare. Yesterday I went down again with several St. Louis gentlemen who are here fishing, and we took eighty bass. We met Captain Rich and Mr. Abbott, of Milwaukee, then fishing from a new machine, and having a fine time. One of the gentlemen of our party tried a trolling spoon, and afterwards a fly, and then a baited bass fly, but none of them would attract, and he was not awarded with a bite or a rise. If I noticed any preference shown for our bait it was for a minnow's head, but if I take the individual score of any one bait I must yield the palm to the festive bull-frog, a small specimen of which we captured on our way to the lake, and which I kept for a bait for several days before he finally lost it down the gullet of a voracious one. The only disadvantage in using it for the first half hour was its occasional trips to the surface of the water, perhaps to see if the fishermen at the other end was all right. On such occasions a sudden downward "yank" of the rod would take him under and he would stay there awhile. I attribute the success of live frog fishing to the fact that ordinary anglers, on their way to the lake, and till he finds a bass with open mouth, when he crawls in, and before the bass can throw him out the hook is fastened and the jig is up. How is this for theory?

If an early start is made from the lake, a few hours can be put in profitably at Trout Brook, above and below the bridge. I took twice the afternoon my wife was with me, and while they were small, you know how much above the ordinary speckled trout they may be prized. Yesterday Capt. Rich and Mr. Abbott took twenty odd with the fly, using only the common brown tackle. Yours truly, Jno. W. Musson.

Ashland, Wis., July 30.

MASSACHUSETTS ANGLING.—Wareham, July 30.—Mr. Editor: The present is really a jubilee of fishes in the head-waters of Buzzard's Bay, embracing Wareham, I feel it an important duty to herald the fact to the outside barbarians of the universe, that they too may participate in these bountiful gifts of Dame Nature. There is not a day in the year that fish of some variety cannot be procured in our waters. Our oysters are of the choicest; quoshes, clams and scallops abound on our shores of miles of shores, rivers, creeks, lagoons and coves. Of our sole fish the white perch, *Morone americana*, a resident citizen, is taken every month in the year, in winter by fishing through the ice. In early March, when the weather becomes warm, he takes the worm and shrimp until the waters are chilled with the frosts of winter. Favorite grounds for this choice fish are on the Agawam and Wee-wa-wa Rivers. The former, the most successful and convenient, as a walk of from three-fourths to one, and quarter miles from our village will take one to the marshes, on the shores of which the angler takes his stand, or by an accumulation of dry seaweed he makes a comfortable sitting.

In March last I indulged in a tide (last of an ebb and first of a flood, we call a tide) of this rare sport, and on the point where I took my stand there were by actual count forty-three fishing; men, women and children, using every conceivable rude stick which bore the slightest resemblance to a rod or pole, and all got more or less fish. About this season our welcome light-catcher also puts in his annual appearance in salt for a few hours, and then removed to the stove oven, where he is roasted or baked, and when done he is served on the table as the choicest of all titbits of one's home. Following next in season is the tautog (in New York black-fish), scup (in New York porgie), striped bass and black or rock bass, all of which remain until late in autumn, except scup. Early in July the most welcome bluefish makes his annual debut with vengeance among the menhaden, while he announces rare sport to the amateur and professional angler. Last comes the squeteague, weakfish (New York), trout (Fort Monroe), *Cynoscion regalis*. He gets along from the middle to the last of July. In fact our waters are now prolific with that gay fish, save fins and tail, which, like peacocks' feet, are most horrible. If there lives in the flesh an amateur angler who has not experienced the sport of catching and landing a squeteague, he certainly deserves the pity of the knaves of the rod and reel throughout the land.

On the 1st of July our Commonwealth of Massachusetts, by statute edict, opened the broad gates to our inland waters, inhabited by that princely game fish, the black bass, and thus far the angler has been well rewarded for time and labor bestowed. Our neighbor, Joseph Alden, a true disciple of the rod, takes the lead in this sport, and has caught from the pond a bass weighing the scale beam at five and a quarter pounds. As scores of lakes and ponds in this locality are stocked with black bass to an extent defying annihilation, there need be no alarm as to want for all time, provided our State laws are strictly observed.

Our surroundings of land and water, sea and inland; our forests stocked with herds of wild deer, foxes and rabbits, partridges, quail, and wild ducks; the fishes that abound in the salt water; the black bass, pickerel and perch in our lakes and ponds, and last, though not least, the wanton trout, who skips in the numerous crystal streams, offer a greater and more varied advantage to the pleasure-seeker and invalid than any point on the whole coast line of New England. Then again every acre of Buzzard's Bay is admirably adapted to yachting.

Tourists who are sleepless in their undecided minds where to go for cheap recreation are advised by me to pack up and come to Wareham. Take a Fall River boat at New York at 5 p. m., which will arrive here at 7 o'clock next morning. Boats for bluefishing are in abundance, with faithful skippers.

CYRUS LISCOMB.

THE SWEDISH HERRING FISHERY.—Prof. Spencer F. Baird expresses in the *Cape Ann Advertiser* the opinion that sooner or later this renewed fishery may be expected to come to an end, and that after an interval of from twenty to sixty years, or thereabouts, the Gloucester skippers may again, if inclined, engage in the business of carrying herring from North America to Gothenburg. This opinion is based upon the following item which Professor Baird communicates to the *Advertiser*:

Regarding the periodical occurrence of herring in enormous schools in the archipelago and fiords of Bohuslan, I have lately read some Swedish newspaper articles and pamphlets on the subject, and will here give you a short extract thereof: Before the sixteenth century no records were kept of the fisheries. As, however, both king and church had some in-

come from taxation and tithe on the herring, it has been possible to ascertain that such fisheries have existed periodically ever since the beginning of the Eleventh century. Before that time the archipelago was hardly inhabited, and the fishing seems not to have been of any importance but to the scanty population on the fiords, who had too primitive implements for capturing large quantities of fish, and no means of preparing the article for a distant market. The following is a list of the herring periods of which we have any knowledge:

1. About the year 1020.
2. In the latter part of the Twelfth century.
3. From about 1260 to about 1341, thus lasting more than 80 years.
4. About the middle of the Fifteenth century.
5. From 1556 to 1590, thus lasting for 35 years; interval to next period, 69 years.
6. From 1659 to 1690, thus lasting for 31 years; interval to next period, 66 years.
7. From 1749 to 1805, thus lasting for 62 years; interval to next period, 68 years.
8. From November, 1877, to February, 1878.

The most important period was the above No. 7, especially during the last twenty years of the last century. It has been calculated that in some years during that time the annual quantity of herring for Bohuslan amounted to at least one and a half million barrels.

During the six weeks, January 1—February 15, this present year, about 160,000 barrels of fresh and salt herring were shipped from the archipelago of Bohuslan to neighboring markets. The fishermen and merchants are preparing largely for making big hauls, when the herring will return in the fall, as is expected.

Believe me, dear sir, sincerely yours, JOSUA LINDAHL.

TROUT AND POTATO BUGS.—Editor *Forest and Stream*: noticed in your last week's number a statement that fish were killed by eating potato bugs. I have good reason to think that is a mistake. Last fall a neighbor of mine was in the habit of putting out a bait of fish daily with from two to three quarts of the beetles, which he had gathered from his potato vines. One day I asked him to give them to me. He handed me the pail, wondering at the same time what I intended to do with them, and supposing, like many others, that potato bugs were poison. But I had seen turkeys eat them with a relish, so I did not hesitate to try them on brook trout. Of course, they ate them, as sensible trout should. In my opinion it does not pay to raise brook trout for table use if we can't teach them to live on potato bugs; and furthermore, I think that any brook trout that can't live on potato bugs in their season and enjoy life, manifest a great lack of good breeding and a great want of refined taste. I feel it my duty to exhort all my brother fishermen to train up their fish (brook trout in particular) with good moral principles and with habits and tastes to conform with this age.

Ludlow, Pa., Aug. 5, 1878.

The reported cases of potato-bug-poisoned fish, we presume, may be accounted for upon the supposition that the bugs have been themselves poisoned by Paris green. Next week we shall give authentic information upon this subject, Paris green poisoning of birds and game, which has become a very serious one in certain localities.

THE OLDEST TROUT IN THE WORLD.—Really this is becoming complicated. To maintain a satisfactory grandeur in size, weight and number of his fish has hitherto tested the inventive and imaginative faculties of the emulous angler. Now, a Buffalo paper comes to the front with an entirely novel yarn, and introduces a new element into the fish stories. Affidavits must accompany a few vital statements:

We believe the oldest trout in the world lives in Onondaga County. James Sherman has a brook trout in his well that is positively known to be upwards of thirty years of age. He has lived in the well all of these long years some thirty feet under ground, making frequent visits to the upper regions, when drawn up in the bucket. For five or six years of the time the well had a chain pump and was covered tight. The trout now will weigh less than half a pound, in shape resembles a bull-head, having grown broad across the head, and sim in the body. He is darker in color than the ordinary fish, and looks the "ancient fish" that he is. Who can match him for age?

WEIGHT, NOT NUMBER.—Mr. C. F. Clapp, the intelligent editor of the *Sunbury (Pa.) American*, echoes the sentiments of a great many anglers when he says:

"If the catches of fish were stated in pounds instead of numbers it would be much more satisfactory. When such large numbers are reported they are generally nearly all fingerlings, which it is a positive disgrace to any one styling himself a fisherman to retain in his creel. It is this sort of fishing that depopulates streams, and finally renders any real pleasure in fishing abortive. Any numbers of such fish will not compensate the real angler for the magnetic thrill of hooking a one or two pounder. The most reprehensible practice is this greed for numbers."

DO FISH TALK?—Certainly; out in Colorado, Pike's Peak.

THE PREPARATION OF SILK GUT.

EDITOR *FOREST AND STREAM*:

As I may have been misunderstood in the articles which I have written for the *FOREST AND STREAM*, which only partially described such of our native silk worms as were most suitable to procure silk gut from, and their food; also, the best time and way to procure them for the purpose of rearing them, I noticed that the cocoons should be collected in the fall or spring of the year. I did not attempt to describe either the method or time in the life of the insect when the gut should be drawn. I did not suppose it possible that anybody would think of drawing silk gut from a worm that had already exhausted itself of silk in spinning its cocoon, or from the chrysalis, and I now repeat that the most suitable time for collecting a stock of these insects to breed from is either in the fall or spring of the year.

Late in the spring or early in the summer the moths leave their cocoons, and soon deposit their eggs, which are hatched about the time the leaves appear on which the larvae feed.

Perhaps I should have written another paper stating that the cocoons should be placed in a cool room, and as soon as the moths make their appearance and conjugate the females should be placed in large pasteboard boxes, in which they

will soon deposit their eggs. These after a few days will hatch, and will require suitable food. If *A. Eriopis*, the leaves of the plum tree or *Fulco* fall shrub; if *A. Promethes* are the breed, the leaves of the saffrair or spice bush should be given the young larvae, or worms.

I have drawn silk gut not only from the *Eriopis* and *Promethes*, but also from the Italian silk worm. I have never killed the worm, nor put it in vinegar for this purpose, which may be the best method. Soon after the larvae ceases to feed he begins to spin his cocoon, which is the right time to draw the silk gut. I put the worm to a board, putting one pin in his caudal extremity, and another pin about one-third of his length back from his head. I then, with a sharp knife, cut off the fore-part of the worm far enough back to cut off a very little of the sac containing the silk, which is a fluid of about the consistency of the white of an egg. I then laid on a large pin, and dipping it in the fluid, silk, which adheres to the pin, I draw out the silk slowly (the more slowly the larger will be the gut), until I have drawn out all, or nearly all of the silk contained in the sacs. I then take another pin, and attach it to the other extremity of the gut, at the point where I divided the worm. The two pins are then stuck into a board, drawing the gut taut, which soon becomes hard and fit for use. The dried silk is then some cases laid out on a board, in contact with the air. I will only add that the reason why your readers may have seen so few of these moths is because they fly only in the night.

T. GARLICK.

We append the following touching lines from our brave old friend. We sincerely trust that health may come again to him:

I have written the foregoing paper under very great suffering. It was so badly written that I had my daughter to copy it. I presume this is the last article I shall ever write for any paper. I may get better again; but know full well that this contest between disease and life cannot continue much longer. For nearly fourteen long weary years this contest has been going on—a constant fight. I am now well into my seventy-fourth year, and glad that I am so. I am, Sir, sincerely yours, T. GARLICK.

Bedford, O., August 6.

ON THE BIG SOUTH FORK.

STANFORD, KY., July 10, 1878.

EDITOR *FOREST AND STREAM*:

The seemingly fabulous reports made of success in fishing the lower waters of the Big South Fork of Cumberland River induced Col. J. E. Faulkner, of Lancaster, Ky., J. L. Loomer and myself, of this place, to undertake 100 miles of travel—much the greater part of that distance by road—wagons over the most villainous mountain thoroughfare that can be found east of the Rockies—that we might see for ourselves where no knight of the rod had ever been seen by the Methuselahs of that section. Mouth of Rock Creek, seven miles below Devil's Jump, was our destination, which we reached Wednesday 10th inst. after nearly two days and a half of horrible travel. Col. J. L. Loomer, of Wayne Co., started with us on his horse Tuesday morning and accom. us to the river, where he meant see that our road was of the best, and he had negotiated with a native, and possibly accompany us to the terminus of our seventy miles' cruise to Point Isabel at the mouth. After spending one night with us upon the river he concluded to return Thursday with our wagoner, who preferred to rest his team nearly twenty-four hours before starting back. His desolation of us was a sad blow to all. A couple of staunch canoes had been made for us by specifications and a couple of expert carmen engaged for the trip. In less than fifteen minutes after we had unloaded our gear and taken river and began fishing, our agents were watching minnows. I had the felicity of leading a seven and a quarter pound pike into the landing net, which fish as served within an hour by Col. Bohon made one of the most savory dishes that any of the nine men partaking thereof remembered to have ever eaten. Immediately after dinner we loaded the canoes, pushed off for Devil's Jump seven miles above and began fishing with minnows.

We caught black bass by the scores. Could see them in the water clear as air, dart from the rocks and seize a minnow at almost any depth, utterly regardless of glittering gill and the painted dots. They are not at all fastidious in matters of diet. I saw Col. Faulkner catch four of them averaged one and a quarter pounds with one minnow which was dead when taken from the bucket. Of course he was trolling it slowly when each one seized it. At the jumps he took a ten pound walleyed-eyes pike a dead chub which had begun to decompose. It had been cast into rather swift water and the butt of the rod thrust into a crevice to await a bite, while he manipulated a heavier jig. A No. 2 Meek reel, small grass line and a willow Japanese rod, delicate enough for fly casting, constituted the tackle with which he landed him. The purpose, in absence of landing net, dexterously lifting him out by hand. That salmon was caught in perfectly clear water at mid day. We caught so many fish that the residents felt heir to at least two-thirds of our catch. We didn't merit a single fish to die and be thrown away. In canoeing 70 miles we made but two portages at what the residents call the "Dries," a distance of about two miles, where the river at a low stage is diverted into a subterranean channel. Late rains had filled the ordinarily "dry ponds" and our portages were little more than twenty five and seventy yards. Easily made, though at noon, when old Sol peppered us mercilessly. Our ministerial companion preached by appointment to a small congregation on the river bank under a "huge spreading beech" on Sunday forenoon.

One of our oarsmen went home Saturday afternoon and returned Sunday, bringing us the claws and tail of a catamount which he had killed as he traveled homeward.

Game is said to be quite abundant—deer, turkey, partridges, wild cats, catamounts, wolves and bears. A large flock of domestic geese have become wild and are frequently seen near the Devil's Jumps.

The best way for natives in fishing is grapevine trot lines, bark "set outs," with short line and hooked on at surface of the water, spears, guns and traps. We saw many traps with dams which it is impossible for a fish to escape in traveling down stream. We killed pike, salmon, black bass and catfish, catching nearly all in shallow, swift water. The bass ran much smaller than expected, ranging from one half to three pounds. Most caught were of about the same size to one and a half pounds. We were very successful in catching a large number of small minnows in central Kentucky. The C. S. R. R., when completed, will make the Big South and its headwaters in Tennessee, where it is called New River, of convenient access and the skeptical can easily verify our declaration that no river in Kentucky affords a title of the attractions to anglers that does the one above mentioned. Despite the hardships our trip was one of sufficient delight to create a longing to return, and if the C. S. R. R. isn't soon finished there'll be another wagon ride over Jordan-like highways.

There were many interesting points which deserve especial and elaborate description, but I shall not burden your columns with them.

KENTUCKIAN.

—A new wader in pedestrian circles is to walk half a mile in six hours, moving all the time. It takes a "Professor" to do this kind of business.

Rational Pastimes.

MISSISSIPPI LACROSSE.

EDITOR FOREST AND STREAM:

In the game of Indian ball between the Sixtowns and Turkey Crocks, the necessary accoutrements were the ball and bats, the ball being smaller than a base ball, but equally as hard. The bats are made of hickory, about three feet long, one inch in circumference at largest end, and taper to small end. About one-third at small end is flattened and bent like the bow of a whip or like a wide U, one side being shorter than the other. After the bow is flattened it is fastened to handle with buckskin thong, and a netting of green deer skin fastened to it like a snow-shoe, the meshes being too small to allow the ball to pass through.

The game is to get the ball home. They select a clear field, about 500 yards long and 100 to 200 wide, the boundaries at ends being "home." The players gather at the field selected, bringing their squaws, the squaws their camping outfits and ponies. The big chief calls for a player, upon which the players arrange themselves in rows. When the peace pipe is handed around and all take a pull at it, the big chief—the one occupying position of referee and judge—makes a talk, to which the chiefs of each tribe respond. In meantime the squaws are busy getting things arranged in camp, and making coffee (this they keep up during the game), and by the time the player is over the pipe, the game again goes on its rounds, the coffee is ready for players, which they drink without sugar or milk and as hot as possible.

After each player has retired to his wigwam and drank his fill of coffee, the game is called, a line drawn in centre of field, the players take their places, each provided with a bat, upon each side of line facing their goals, with opponents between them and the goal, a long space between of about twenty yards. The big chief goes to centre of space and throws the ball as high as possible. As quick as it leaves his hand each tribe utters a yell and goes for it. The excitement has commenced, and the manner in which they catch and throw the ball with their bats is startling (they are not allowed to touch it with their hands) and the ball is sent flying over their heads by some good player; they yell and run for it; it is thrown back at the opponent, and the game goes on like this; the crowd; it falls into clear space, and on the ground they rush at it, struggle for it, and fight for it. A player has it and is running for home with it; with a yell, like bay of hounds after fox, they are after him; it's a race for it; one player gains on him, is neck and neck, and by a dexterous movement of his bat takes him from out the other's bat and starts back to it; the other player sees this, and follows him like a fox; hard pressed, but of no avail; his ball is taken from him; again thrown into crowd to be struggled and fought for. Thus the game goes on for hours, neither tribe seeming to gain an inch, when, by an expert play, the ball is sent "home" in favor of Sixtowns, when they yell and adjourn to drink coffee, smoke, and tell tales until dark, when the fiddles are brought out, a fire started among the dance commences and continues until daylight, when they go full of the game. The dance is conducted as wildly and madly as the game, with the exception of yelling. Coffee—black, strong coffee—flows freely all the time. When daylight comes they go their several ways rejoicing. At annual meeting they keep it up for a week at a time, and are decked out in paint, feathers and gay colored ribbons.

When visitors come to become thoroughly intoxicated with excitement, let them attend a game of Indian ball, and if they choose to bet they will be accommodated, as the squaws will bet anything from brass buttons to the clothes they wear, and if you lose you must pay and if you win you must take the wager.

VAL.

Jasper County, Miss., July 26.

ARCHERY CLUBS.

IN forming archery clubs two methods may be adopted—the members may own their own outfits or the equipments may be the common property of the club. The latter is the better method—because, as a rule, the members do not know the weight of bow best suited to them, and therefore it is not until after considerable practice that an archer knows his or her strength. It also enables the club to start with much less expense and leaves it optional with the members whether to own bows or not. The Orontian Archers started as follows, and the plan has worked well: They bought three low-priced bows and four arrows, and each member bought a bow and a member, and for which they are held responsible. The whole outfit, including one tassel, two gloves and two arm guards, cost the members \$1.50 each. Many have since bought fine bows for their own use and to enable them to practice between the weekly meetings. The number of members in this club is fifty, and is limited to that figure, but it is better, if possible, not to have over twenty-five, as it requires much time and space for so many to shoot. Ladies should commence with a bow from five feet to five feet six inches long and pulling twenty to thirty pounds. Gentlemen should use a six-foot bow pulling from thirty-five to fifty pounds. The distance should be, for beginners, that at which they can hit the target once out of an end (an "end" is three arrows). As soon as they can strike it three out of four times they should go back a yard. Most of our archers use the "end" and the "one" target, at too short a distance; twenty-four inches in diameter is the smallest that should be used, but four feet is the regular size and the full distance is seventy-five yards for ladies and one hundred yards for gentlemen. The best wood for cheap bows for beginners is lance wood. Fair American bows can be bought for from \$3.50 to \$4; fine imported lance wood bows cost from \$5 to \$12. The best bow for practice at short range, cost about \$3 per dozen; but for long range, arrows carefully finished and footed with hard wood, with parallel steel points, are the best thing; they cost from \$9 to \$12 per dozen. In using heavy bows an arm-guard and glove or set of finger tips are necessary. The members at the club meeting should divide into sides, those making the highest scores at the last meeting acting as captains. Each member should fire three arrows, making an "end" and the "one" target, each has had his turn. The centre or gold counts 9; red, 7; blue, 5; black 3, and outer or white 1. The ladies should have their targets one-fourth the distance nearer. In the next article I will give a few necessary rules for governing clubs and their shooting matches. The following are a few of the archery clubs recently organized: Brighton Beach Archery Club, N. Y.; Brooklyn Archery Club, Brooklyn, N. Y.; Glen Cove Archery Club, N. Y.; Junia Archers, Tyrona, Pa.; Orontian Archers, Hackensack, N. J.; Oyster Bay Archery Club, L. I.; Palisade Mountain Archers, Englewood, N. J.; Robin Hood

Archery Club, Le Roy, N. Y.; Staten Island Archery Club, Staten Island, N. Y.; Wabash River Bowmen, Indiana. W. H. Pres. Orontian Archers.

ARCHERY IN THE WEST.—We should expect the West to be at the front in the archery movement, for Mr. Thompson is an Indiana man, and the President of the flourishing Crawfordville, Ind., club. Chicago has a number of clubs, and Milwaukee has just organized the "Lockeley Club." A match recently shot at Highland Park, Ill., between teams of Highland Park and Chicago, resulted in the following score:

	Highland Park.	30 Yds.	40 Yds.	60 Yds.	Total.	Hits.
C O Hammond.....	109	66	17	192	47	
F D Hall.....	126	48	21	193	54	
W M Goodridge.....	143	44	19	206	41	
H O Carver.....	149	84	59	283	59	

Total..... 518 242 416 876 181

	Chicago.	30 Yds.	40 Yds.	60 Yds.	Total.	Hits.
J C Haines.....	125	110	12	237	53	
A G Spalding.....	84	84	22	190	45	
I S Collins.....	77	90	19	193	40	

Total..... 373 379 52 833 155

BICYCLES.—Brave Bostonians boldly bestirred briskly bounding bicycles, etc., (we could not that as long as bicycles roll), and from this city, which is the "Hub" of the machine, the sport is winning its way into favor in other cities. One Boston young man, Mr. M. E. Parkhurst, an amateur rider, makes his bi-weekly trips between Clinton and Boston, a distance of 45 miles, in a tripe over six hours. The machine used by him is a 48-inch duplex Excelsior bicycle. He also makes daily trips to towns in the vicinity of Boston, frequently riding to South Scituate, New Bedford, or Wrentham, and after dinner and returning before nightfall. Mr. Parkhurst averages about 30 miles every pleasant afternoon. Mr. W. R. Pitman, a bicycle expert, who has been traveling through the State of Maine, reports a great interest in the "silent steed" among young men in all the principal cities. In Bangor a bicycle club has been organized with nearly 20 members. At South Scituate, Me., Mr. W. R. Pitman, a series of amateur matches will take place on the race course when Boston amateurs will display their skill, and (hence we may expect to see the sport imitated by emulous riders throughout the State. At Detroit, Mich., last Fourth of July a masquerade procession mustered three hundred in line. It is stated that there are 3,000 of the old-fashioned velocipedes in that city. At New York, N. Y., the "Hub" of the "bicycle shakers," but the bicycle will probably win the place as soon as it becomes known. San Francisco papers advertise the new silent horses, which means of course that dealers are selling them to the muscular men of the Pacific Slope. Inquiry at the principal stores in New York, where the machines would be found if in the city, develops the fact that the craze has not yet struck the Metropolis. The long-past furor over the old-fashioned velocipede has left in its wake a general hesitancy about again investing in a like machine. We are strong in the belief, however, that this mode of locomotion has a great future here as all over the country.

A LONG SWIM.—Kunno Dimmers, a Bowery photographer, and Hans Tuelff, formerly of the Prussian Army, dived from Harlem Bridge at a quarter past ten o'clock last Monday morning, and started out on a swimming race down the East River and the Bay to Staten Island. The race was for \$300 a side to determine the relative abilities of the two men, each of whom had a good reputation as an expert swimmer. Dimmers, being near-sighted, wore spectacles. Three boats accompanied the swimmers, and they were cheered all the way by the enthusiastic gathering of spectators along the docks and by the shrill whistles of the tugs and steamer. The waves caused by the vessels gave the swimmers much trouble. The river was crossed four times in order to take advantage of the tide, which was on the ebb. The worst eddies encountered were near Hell Gate. The swimmers made good time, however, although their zigzag course increased the distance by over six miles on the East River alone. They kept close together until Thirty-fourth street was reached, when Dimmers was seen to be slightly ahead, and he gradually widened the gap between himself and Tuelff so that he led by two hundred yards when the Battery was reached. He was swimming vigorously. Tuelff, opposite Bedloe's Island, was seized with a cramp, and was obliged to give up the swim. Dimmers now had the race in his own hands, but the hardest part of the work remained, for the tide was against him after passing Governor's Island. His pilot, Wm. Allen, took a course considerably to the left of that usually taken by Staten Island ferry boats, and led Dimmers nearly in a straight line. When Dimmers arrived opposite Clifton he changed his course and swam directly for the shore, reaching it at 6:51 p. m. As he neared the shore he was cheered all the way by the crowd. They were slow, but full and vigorous. On reaching the dock between Stapleton and Clifton he was rowed ashore. He looked and acted as if he could have gone a greater distance. Mr. Dimmers claims that he swam twenty-five miles, and the referee and pilot are of the same opinion. Dimmers complained of the sun, and his face was much burned. He drank nearly a bottle of brandy and ate a number of sandwiches on the way. As the boat containing Dimmers' clothes had stopped at the Battery with Tuelff, he was obliged to borrow a shirt and a dilapidated pair of pantaloons to wear on his way back to New York, where he arrived at 7:30 p. m. Dimmers is a powerfully built man, about six feet in height; he weighs 235 pounds, and is twenty-five years old. He is a native of Dusseldorf.

THE WHEELBARROW MAN.—There was some general incoherence when the Albany pedestrian, Mr. R. L. Potter, started out from that city last April to wheel a barrow toward the Setting Sun. But the plucky fellow is still at it, and we hear of him now and then in the papers, as he goes along. The Laramie City (Wy. Terr.) *Daily Sentinel*, of October 31st, heralds his entry into that town at the 30th, and says: "Potter is in excellent health and spirits, and says he has gained eight pounds in weight since starting. He has now been on the road 112 days, and has traveled about 2,657 miles, leaving but 1,428 to finish the journey of 4,085 miles, that being the distance from Albany to San Francisco, by way of San Jose, he not being allowed to cross the bay at Oakland. He will pull out this evening and will reach there in 103 days. There are 103 days allowed him, and if he goes on at the present rate he will reach San Francisco a month ahead of time."

OLBURY ON THE TRAMP AGAIN.—Last Monday evening, at 8 o'clock, in the Boston Music Hall, O'Leary started on his walk of 122 miles, which he will attempt to finish in less than 22 hours. The track is 2594 feet in circumference, requiring twenty circuits to the mile.

New Publications.

HORSEBACK RIDING, FROM A MEDICAL POINT OF VIEW, by Ghislain Durant, M. D., Ph. D. New York: Cassell, Petter & Galpin. 1878.

Horseback riding has ever been accounted among the more manly and noble of sports. If we seek a philosophical reason for the exhilaration and pleasure it affords we may find it in the poetry of motion, the buoyant emotions always excited by rapid progression. The acrobatic of this exultant feeling is experienced on the ocean when the ship or the yacht catches the spirit of the winds, and bounds over the waves. On the land there is no situation so near approaching this as that of the novice on a speeding locomotive. The same feelings are experienced in a lesser degree by the horseback rider. It is subjecting to our use, and making subservient to our will, a more powerful organism, and also a doubling and redoubling of our own powers. Horseback riding is suggestive of the fresh, open air, as you may find it in the early morning on the hills. Dr. Durant tells us that, in addition to the inspiring influence of this early air, which we are led into, there is the increased circulation of the blood, and a consequently quicker breathing induced by the exercise, so that we are enabled to receive the full benefit of the ozone. The effect of muscular exercise upon the quantity of air which enters the lungs has thus been tabulated: Lying down, 1; standing, 1.34; walking at the rate of a mile an hour, 1.50; riding, at a walk, 2.20; riding, at a trot, 4.03; swimming, 4.37; running, seven miles an hour, 7. Dr. Durant's essay, in so far as it indorses this mode of physical exercise, and, by drawing attention to its healthful results, induces people to practice it more, may be regarded as a valuable contribution to the cause of physical improvement.

THE WITCERY OF ARCHERY, by Maurice Thompson. New York: Charles Scribner's Sons. 1878.

This is a handsome volume, made up of Mr. Thompson's contributions to the magazines. The articles in *Scribner's* and *Harpers* descriptive of the sport to be had with the long bow, and the great degree of skill to be attained with that implement, have given a notable impulse to the game. It is not a matter of any great surprise that the result should have been as it was. A better audience, both in intelligence and numbers, than is afforded by the readers of these two most popular of American magazines could not be asked for the most ardent advocate of creed or pastime. That immediately after the appearance of his enthusiastic sketches Mr. Maurice and his publishers should have been overwhelmed with letters from every part of the world was nothing to be wondered at. It was just what writer and publisher might have expected. Mr. Thompson may be accorded all the credit for the revival of the sport in the United States. The book now before us is the latest contribution to the cause, and is as warmly welcomed as, in a more convenient form, containing, in addition to the most valuable and practical instructions for the government of archery clubs and practice. Let us add that the illustration, "A Prize Shot," represents an impossibility. Such a fair-faced young woman never could have shot that hare, and have held it up as she is represented as doing.

THE AMERICAN NATURALIST.—A vigorous article from the pen of Dr. Coates on "The Ineligibility of the European House Sparrow in America" opens the August *Naturalist*, and deals with a question of very great interest to all who love our native birds. Dr. Coates deals with this question in a very forcible manner, and, although the Sparrow question has become a rather tiresome one, we welcome the latest contribution, giving a new interest even to such a worn-out topic. We are glad to find in this number of the *Am. Nat.* the work of Mr. Lockington's charming sketches, "Walks Round San Francisco—The Bay Shore." The present article equals in interest the former one from the same graceful pen, to which we called attention in a recent number of *FOREST AND STREAM*. Prof. A. S. Packard contributes an interesting article on "Some Characteristics of the Central Zoogeographical Province of the United States," in which he gives us the results of his studies on the distribution of certain insects, and especially the Philopod Grasshoppers in the Rocky Mountain region. The "Report of the Committee of the American Association of 1876 on Biological Nomenclature," by Prof. E. D. Cope, is a paper of great value, but is of interest only to the publishing naturalists. All archaeologists will read with pleasure Mr. Barber's paper on "The Ancient Pueblos, or the Ruins of the Valley of the Rio San Juan." We cannot have too full records of the manners of life of these long extinct peoples, whose only monuments are these ruins, now fast falling to decay. Mr. Barber's article is illustrated by a number of plans and sketches, and perhaps, save to convey to the mind of the reader a better idea of these ancient fortresses and dwelling places than any description. Prudent housewives will be terror-stricken by the title of the concluding article of this number, "The New Carpet Beetle (*Athanasia acetabularia*)," by J. A. Lintner. The picture drawn by the writer of this diabolical pest may be considered overdrawn by those who have never been obliged to wage war with it or its relative, *A. varius*; but we are of opinion that no professor would find this beetle and its kind in their dwellings it will be almost impossible to eradicate it. The departments of "Recent Literature" and "General Notes" are even more full and interesting than usual, and the August number, as a whole, is exceptionally excellent.

THE HUNTER, or Hints to Young Sportsmen. By Charles P. Crosby, revised edition, La Crosse, Wis.: Crosby & Hixson, Publishers. 1878.

This is a pamphlet of some thirty-nine pages, written by a boy or eighteen who has written a book, set it up, printed it, a 14c edition, and now wants to sell another. The pages of the amateur author are full of information and directions of a practical nature which are evidently the outgrowth of the writer's own experience with the gun in the woods, and if there are occasional bits of slang and mistakes, as we should expect in such a work, indignant readers should pass over the faults and considerably regard only the good points. We may add that the firm which issues this book also publish a sporting gazette, for which they charge the modest sum of twenty-five cents per year.

BOOKS RECEIVED.

THE MODERN ARCHER; or, Instructions for the Use of the Long Bow. New York: Peck & Snyder. 1878. Price, 25 cents.

A MANUAL designed to give practical directions for acquiring skill with the long bow, rules for archery practice, etc., etc.

OUR NATIONAL PARK: A Cayuse Ride Through the Future Grand Watering Place of the World. By A. E. Bishop. *Atlantic* Press, Atlantic, N. Y.

MANUAL FOR RIFLE PRACTICE; Including Suggestions for Practice at Long Range, and for the Formation and Management of Rifle Associations. By Gen. Geo. W. Wingate, General Inspector of Rifle Practice. Sixth revised edition. New York: W. O. & P. P. Church, 245 Broadway. 1878.

A HEART TWICE WON; or, Second Love. By Elizabeth Van Loan. One volume, uniform, black and gold; price \$1.50. Philadelphia: T. B. Peterson & Brothers, 506 Chestnut st. 1878.

The Game of Chess.

NOTICE.—Chess exchanges, communications and solutions should be addressed "Chess Editor FOREST AND STREAM, P. O. box 64, Wolcottville, Conn."

Problem No. 23.

Tourney set, No. 18. Motto: Down on Duals.

White to play and give mate in three moves.

—Problem No. 21 was incorrectly printed, viz.: The WHITE PAWN at QUEEN'S third should have appeared as a BLACK PAWN at QUEEN'S sixth. The missing WHITE KING in Problem No. 22 should be placed on QUEEN BISHOP'S sixth. Solvers, problemists and exchanges will please make note of these errors if it be necessary on their part.

NOTES.

- (a) A most extraordinary move to make in this position.
(b) A beautiful termination.

INTERNATIONAL CHESS TOURNAMENT AT PARIS.

The synoptical table below shows the result of every game played in this tourney. Mr. MacKenzie, of New York, is "placed" as a prize winner. The prizes offered are valued at 14,000 francs, and are five in number. Mr. MacKenzie's score with the leading players of the tourney is fully what we expected, and entitles him to equal prominence with Winawer, Zukertort and Blackburne:

	Winawer	Zukertort	Blackburne	MacKenzie	Hill	Anderssen	Englehorn	Paulsen	Mas	Clerk	Gifford	Pittselli	Redd
Winawer	—	10	5½	0½	11	1½	10	11	13½	11	11	16½	
Zukertort	—	10	0½	11	1½	10	11	13½	11	11	16½		
Blackburne	5½	10	10	10	10	10	10	10	10	10	10	10	
MacKenzie	1½	10	10	10	10	10	10	10	10	10	10	10	
Bird	0	0	0	10	10	10	10	10	10	10	10	10	
Anderssen	0½	0½	0½	0½	0½	0½	0½	0½	0½	0½	0½	0½	
Englehorn	0	0	0	0½	0½	0½	0½	0½	0½	0½	0½	0½

Total	0½	5½	1½	9	9	9½	10½	10½	13½	13½	18½	19½	

PORTABLE TURKISH BATHS.—The advantages of Lubin's portable Turkish baths are many, and their ready sale proves them to be in high favor with the public. They are to be had for a low figure, there is not the danger of infection common to public baths, the stifling hot room is done away with, the heat or vapor being confined about the patient by a water-proof cloak, and the work of the medicinal agencies is thorough in entering rapidly the pores of the skin. Skin diseases, catarrh, rheumatism, neuralgia, fever and ague, dyspepsia and asthma are among the many diseases that yield under proper treatment in this bath through the medicinal agents supplied with it.

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$3; three months, \$1. To clubs of two or more, \$3 per annum.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

B. M. S., La Grange.—Know nothing about the puppies advertised.

DATTON, O.—Read the line immediately beneath the heading of this department.

G. L. R., San Antonio.—Hallock's "Gazetteer" costs \$3, \$4, or \$5, according to binding.

A. T., Philadelphia.—This is such a special case that we could not advise you. Better call on a local surgeon.

C. C., Philadelphia.—For books on clog dancing and hanjo playing send to Fish & Simpson, Nassau St., N. Y.

J. B., Boston.—Game is getting very scarce about the settled parts of West Texas. So our latest advices inform us.

JACK, N. Y.—Send for what repairs you want to Mr. Squires, No. 1 Cortlandt st., N. Y. It will be done in excellent style.

M. D., Dedham.—The number of shots you give is only a fair, not a good pattern. It ought to be fully 200. Shot concentrations do no harm.

H. R., New York.—Large and small displacement are only relative terms. No strict line can be drawn between the two—they merge into one another.

A. C. T., Ashtabula, O.—In his late English matches Capt. Bogardus used a Scott gun, 10 lbs.; with two sets of barrels, one 10 gauge, the other 13 gauge.

J. T. G., Gaylorsville.—You have sent us the real helgramites. If you could find some one who could collect them they might be sold for bait in New York.

CONSTANT READER, Paterson, N. J.—We have no record of when Iaine first shot on the stage. Think it was not much previous to the date you mention.

H. W. A., Byron, Mich.—The name you mention is that of a maker in excellent repute. Yours of their make compare favorably with those you mention.

G. W. B., Lancaster, O.—1 and 2 a most reliable person, and manufactures excellent guns; can be relied on. 3. 3½ measured drs. of Dittmar, 1½ oz. shot.

A. A. A., Port Perry, Ont.—There exists no work on steam-yacht building. Our back files will furnish much information on the subject, especially in No. 19, Vol. X.

BERGEN SOCIETY FOR THE PROTECTION OF GAME, N. J.—Are chimney swallows insectivorous birds, and as such entitled to the protection of the game laws? Ans. Most certainly.

M. B., Batavia, O.—It is contrary to our oft-expressed rule to discriminate between guns. We can only refer you to our advertising columns, which represent the best guns made.

R. R., New York.—Please give the address of the Secretary of the Columbia Rifle Range, just opened in New Jersey. Ans. John Kennel, Secty. Columbia Rifle Range. Bergen Heights, N. J.

C. R., Albany, N. Y.—Will you give the kindness to inform me what shooting there is in the immediate vicinity of Bloomington, Ill. Ans. There is excellent pinnated grouse shooting on the prairies.

L., Winslow, Ill.—We have already stated that Dr. Carver's eyes were all right. The programme of his exhibitions was published in our paper last week. Any letters for him should be sent to us.

C. A. T., Glenville, Conn.—Much obliged for sending the fish eggs, which we would gladly have studied them, but they arrived in such a broken and decomposed condition, that they were unrecognizable.

A. R., Akron, O.—Will you give me the address of a good firm of which to purchase waterproof dog for hunting with? Ans. See our advertising column. The firms who there present their goods are reliable.

S. G. V., Lancaster, O.—Brainerd, Minn., is a most excellent center for large and small game, moose, deer, all kinds of wild fowl, grouse, etc. We have received no late news from the locality, but hardly think that you could miss finding good sport there.

F. C. P., Lowell, Mass.—The half-breed Indian, John Logan, who lives at Half-Way River, on the Basin, near Parrsboro, Nova Scotia, is an excellent guide to the Tantramar Marshes. You may write for information to Miss Wheeler, who keeps the Ottawa Hotel at Parrsboro.

Tan Hesi, Wilmington, N. C.—Can you suggest a substitute for Barbadoes Tar in cough remedy? It cannot be obtained here, belonging apparently, to a past age. Ans. There is no particular virtue in Barbadoes Tar; any other pyrogenous substance would answer the same end.

R. D., Kingston, Miss.—Can you procure for me, and at what price, "Gen. B. L. E. Bonneville's Exploring Expedition Beyond the Rocky Mountains," written by Washington Irving? Ans. Yes; it would be a second-hand book, in good order, and we could send it to you for \$1.50.

N. B.—Two errors occur—typographical (ones)—in our "Answers to Correspondents" last week. To "J. P." of St. Paul's, the printer made the dog have "felous on his eyes." Please read "felms." "J. W. W." of Baltimore, will be kind enough to understand that "dyspepsia" is printed "dropsy."

S. G., Dayton.—My pointer is seriously affected with sneezing, and makes efforts to clear his throat. Have given him sulphur. Indicate treatment. Dog 4 years old. Ans. It is one of the sequels of distemper. Sulphur occasionally is good, also give 2 grains of quinine 3 times a day for a week or two.

W. F. P., Peekskill.—My puppy 5 months old, has a catarrh. When he was born both his eyes were covered, but one has disappeared. How may I remove it? Ans. This is a special case, and will require an oculist to attend to it. We should think a young surgeon in your neighborhood, for the lesson it would teach, would be glad to coach your dog.

B. E. F., Harrisburg.—My setter gyp, 3 years old, is troubled with sore ears. Tips become inflamed, and break out, discharging matter. Coat harsh; nose warm. Will you suggest a cure? Ans. Reduce diet to a minimum, and increase exercise. Use some contrivance to keep the ears from being shaken, and keep them clean, inside and out. If there is discharge, pour in a little diluted lead water daily.

B. AND F., Meriden.—Our Irish setter, 3 years old, has sore eyes. Begun troubling him about 11 months since. One of them is now well,

but the other is giving trouble. There is a continual watery discharge, and slightly inflamed. He licks it rubbed with the hand, and often brushes his paw over it. Ans. Wash the eyes with warm water several times a day, and use a lotion of 2 grs. alum to 1 oz. water three times a day.

CONSTANT READER, Evansville, Ind.—How can I restore the beautiful figure or twist, such as can be seen on a new English double gun? Is sulphuric acid good to distinguish genuine wire twist guns from fictitious ones? What is good for removing rust without scraping? Ans. 1. Honestly we cannot give the mixture. We have recommended several things, but we are afraid that browling must be done by an expert. 2. Yes. 3. You must use mechanical means. A wire brush is good.

A SUBSCRIBER, U. S. Monitor "Mahopae."—Have a pointer 11 months old; has not had distemper; is strong, with good appetite. About a month ago he seemed tender about the head. Shaking. Soon came discharge from his ears, which still continues. Have used Castile soap. What shall I do? Ans. After washing out the ears pour in a little weak lead water, which you can procure from any druggist. Keep the lotion in the ear for a minute or two. The dog has cancer of the ear. Reduce his diet.

INQUIRER, Bradford, Pa.—By chambering buckshot for a choke-bore the following is meant: As the muzzle of a choke-bore is smaller than the breech if the chambering was done at the breech with large shot, in firing they would jam at the muzzle. To obviate this, take a wad which will fit the muzzle, and put on that the requisite number of buck shot to cover it, and use in the shell just that number, by count or measure. It makes no difference in a choke-bore as to the danger, whether small or big shot is used, there can be no liability to accident.

F. F. P., Chatham Village, N. Y.—Have we a right to take brook trout (catching them with a net) from one stream in the same county to another for the purpose of stocking said stream without breaking the law? Ans. Chapter 721, § 19, Laws State of New York, reads: "No person shall at any time catch any speckled trout with any device save that of angling, except in waters which are wholly private, etc." You cannot legally net the trout, though, of course, your intentions are of the most honorable character. It is one of those cases where the innocent must suffer for the guilty. You can procure trout fry from the ponds advertised in our columns, and from Seth Green.

R., Montreal.—Do you think a young man (city bred) could find employment on a sheep farm in Texas? If so, would you advise him to go there, serve for a time, and then start on his own account, capitalizing? What are the chances? How? Or can you refer him to some one posted in the matter? Ans. That depends altogether upon the young man's disposition, grit, present condition, prospects, etc. There is certainly success to be attained by an enterprising person in Texas sheep-culture. "R" could undoubtedly find employment on a sheep farm, and that would be the sensible way to go to work. We can perhaps put him in communication with the proper parties.

M., Wells Beach, Me.—Have been using an old Colt's navy revolver to shoot partridges and rabbits about camp with. On firing a shot three of the barrels went off at the same time, a piece of bullet from the left chamber struck the skin from my thumb. Can you in any way account for three barrels of a revolver going off at one time. Ans. It might arise from the cap exploding and firing the other two. Sometimes the nipples are rusted, so that there is direct communication with the chambers other than directly through the centre of them. Old revolving arms should be discarded. Some bad accidents occur from them. When they were new they were safe, but old age has made them infirm.

J. B. H., Buffalo.—My cocker, 7 months old, has behaved strangely. About 10 or 12 weeks ago it would walk in my absence overfed him. Got sick, but was cured. About three weeks ago hair fell off inside of his thighs. Scabby lumps appeared; cancer came in his ears; had dead. But worse than all, he seems moody and sullen; and snarled at me. Won't play romps with him. Is scrofulous and looks wild in his ears. Ans. Every precaution should be taken to guard the dog safely. Your not believing in rabies will not avert serious consequences therefrom, and the symptoms you give are very unpleasant ones. Our treatment of the dog seems good in the main. Try the effect of kerosene well rubbed in where the itching is, and continue general treatment.

L. F., Eldridge Sp.—For a centre-fire cartridge than can be reloaded a number of times (of the Winchester Repeater) what kind of powder is best? Is Dittmar good? Could a party of two young men make it pay to trap and hunt out West? How is it that Indians are reported to be starving when there is plenty of game out West? Is it the Winchester Repeater used by a great many hunters? Where can a Spencer Repeater be bought, and who are the agents? A. 1. Use FG powder. Rifle shells have not yet been tried with Dittmar. 2. Hard to say not unless familiar with the business. 3. Indians are not always in good hunting grounds. 4. Yes. 5. The Spencer no longer manufactured. Can be bought second-hand in a great many places.

NICK, Wolf Run.—In asking for black bass, using helgramites, should a sinker be used to keep the bait to the bottom, or not? My two pointer pups 10 months old weigh respectively 65 and 52 pounds. What do you think of the weight and how does it compare with standard? They are thoroughbred. What make of gun did Marsh use at the New York Convention? Is Ed. Tinker living yet? If so, does he shoot from the trap still? What is the reputation of Grubb & Co., of Philadelphia, as dealers? Ans. 1. On the surface, floating on the top of the water. Give it movement. 2. You must have very large dogs for their age. Rather big for standard of pointers over 10 pounds. 3. Cannot say, but from information understand it was a muzzle-loader. 4. Tinker lives in Providence, well and hearty. Does not shoot much. 5. Among the most reliable of houses.

TENPENNY NAILS.—A correspondent writes from Philadelphia: "In your paper of July 18, answering 'C. W.' inquiry, you say the ternus sixpenny, eight penny, etc., as applied to nails 'is supposed to be derived from the fact that in early times so many nails were sold for a penny.' That this is erroneous is evident when you consider that they could not give more large than small nails for a penny, but vice versa. I have also seen it suggested that the term is derived from nails having been formerly sold at so many pennies per pound, according to size; but this of course is equally fallacious. A more probable solution is that nails in early times, hand made, were sold at so many pence per 100, still another solution, which I rather favor, is that sixpenny, eight penny, etc., is a corruption of six pound, eight pound, etc., referring to the number of pounds to 1,000 nails; thus designating weight rather than price. It is so now with 'backs,' four oz., six oz., to the 1,000. If this isn't, it is about the best I can think of for it would give a positive gauge for size with all makers and for all time."—We thank our correspondent for his suggestions, though it is all pretty much the same thing. *Si non e vero e ben trovato.*

MATCHLESS.—We have been in an extemporized brush camp before now, when everything was so thoroughly soaked that we could only light our matches by biting the brimstone end. We should not have done this had we been provided with Taylor's self-lighting match safe. —[See adv.]

TRUE MANLINESS.

WE are over-disposed to the use of cant terms. The adjective "true" united to inwardness, has apparently disgraced the former quite simple word. We wish then to invoke no sooner when we speak of true manliness, for it is a quality, which in a certain degree seems to be quite disappearing in our cities. The possession of it is limited, and its absence is absolutely hurtful. We call true manliness that which exerts itself at the proper time, which cannot be restrained and is regardless of profession or surroundings. Mr. Trollope shows what true manliness—English manliness—is, in one of his best novels. A nobleman calls the daughter of a clergyman a degrading name, right in her father's face, and the man of God, despite his high buttoned waistcoat, his white cravat, and all the tenets of the Church of England, knocks down with his good fist the brutal filthier of a woman's reputation. Of course we do not espouse fists, but still occasions do present themselves when their use seems to be called upon. Do any of our readers remember how some weeks ago, in an excursion party in a New England State, some roughs captured the whole train and grossly insulted the women, and how all the men save one took it like lambs, even more quietly than did the women? Such a thing we are quite certain never could have occurred in England. There would not have been a pistol or a knife drawn, but fists would have been used, and the cause of right and manhood would have prevailed. In New York, insults to women in cars are not infrequent. Vulgar, coarse brutality is shown as often by some hectoring bully to men as to women. It mostly passes unheeded. It is quite possible that an unoffending car conductor has blows belabored on him, and not a soul in the car says a word for him. We seem most of us in the cities to have become utterly callous and indifferent about such matters, and a lack of manhood is quite evident. Foreigners who have noticed the impassable way in which insults are given and taken even in conversation are often amazed. They seek in vain for the American spirit. The reply generally made is that pistols are so much carried that an interference might result in death. We do not believe it. Dastards who insult women are always cowards and shrink like curs before true manhood. What is true is this, that we are all getting to have that perfect indifference about other people, and other's welfare, which is the peculiar, unfortunate outgrowth of those who dwell in large cities. We long to hear in the public prints of some one who may take the matter in his own hands, and, using the might which God gives to an honest man, soundly thrash these low curs who disgrace the community. We want occasionally a little more good English knock downs. It may be very coarse, and animal, and cant may call it what it pleases, but this kind of muscular manhoodism keeps bounds in check, and they behave themselves through fear of personal chastisement. We don't desire to hear the click of the pistol nor to see the gleam of the knife, but there are circumstances when men should not be afraid of them. The knowledge that a man has his sinews and muscles perfectly at his command, hardened and supplied by training and athletic exercises, can never be shown to a greater advantage than when it squelches ruffianism.

THE "DECLINE OF RIFLE PRACTICE."

There has been a growing apprehension, and the feeling has found utterance in the public press, that rifle practice in America is declining. It is asserted that the work of the past five years was a mere flurry on the part of a few enthusiasts, who, with their new-found zeal, pushed the sport further than the old steady shooters had ever hoped to carry it, and then, withdrawing, left no successors to carry on the sport. This compound statement is at once true and untrue. It is a fact that modern rifle practice in America sprang from a soil where nothing of the sort had before existed. There had been shooting in America. In town and country, from the Maine woods to the foremost pioneer shot in the West, there was rifle shooting by all grades and conditions; but it was all special. There was no scientific grasping of the problem of marksmanship, no freedom from rut-work, but each rifleman did a certain style of work and looked on as a stranger when other classes of shooters stepped out. The army, in its regular and volunteer divisions, while it was the greatest rifle field in the country, was at the same time the most neglected. In this condition of affairs, the promoters of modern rifle practice entered into public notice and began that crusade which no one will deny has been most magnificently successful. It was fostered by all who, seeing the importance of a knowledge of the use of firearms, did what they could to promote the success of the movement. The press did service, and no small amount, and military men, with some few exceptions, took hold of the new idea with a vim, if not always with discretion. If they did nothing more, they pointed the need of the practice they had set themselves to take, by the public exhibition of their deficiencies. The young plant may have been overworked, may have been strained in certain directions, while complete and healthy development was not attended to. There were international matches and victories, too, on a field where the poorest quality of military practice might have been seen. The people were dazzled by great scores, by comparisons which left the records of the past years of marksmanship absolutely "nowhere;" and then when that particular class of rifle work, in which, as a matter of course, but few can or ever will engage, shows signs of settling down to a uniform living rate, the cry is set up that

rifle shooting is declining. What is the pleasure of a few is taken as an indication of the course of the many. As well were it to say, because a yacht club is disbanded, or all of them for that matter, that the commerce of the nation has been scattered and destroyed, despite the fact that the navy had never been stronger. Should every race track on the land be closed, the use of horses would go on. An effect might be traced in the breed of draught animals, but it would be unfair to say that the use of horses was an obsolete one. If rifle ranges, or any particular range, finds its patronage falling off, the managers had better look to themselves before jumping to the conclusion that all interest in practice had fallen away. One range may be choked to death by niggardly railroad accommodation. Another may have its life blood sucked out by a plague of mosquitoes, and there are some bits of wilderness, dignified by the name of ranges, which are virtually but little better than the original wild. It is not surprising that patrons should become scarce, but it is indeed surprising that the real trouble should not be at once apparent.

Were every range in the United States closed this very hour, and not a single shot fired in practice for a decade, the money, time and effort spent were well expended. An impression has been made, and an example set, which would work good for twelve years. In the ranks of the militia the service has been wonderfully strengthened in self-confidence, and in the good opinion of the civilian public, by what of rifle practice has already been carried out. An example of this was seen in the handling of the impending labor riots in this State, and an example, *per contra*, in the mangling of the actual labor riot in an adjoining State, where rifle practice was an unknown art. Should American rifle practice cease, have we not done a permanent good in dropping the leavens of "system," "position" and "rifle" among the English shooters? What matter is it that we have no international match this year if we see our problems worked out before British butts? We are not an Irishman, or we should say that American rifle practice is carried on in Great Britain.

It does look just now as if rifle practice was on the decline, if we are to judge by the fancy (yet important) item of long-range work; but take the result of the season's work, compare the military record of this year with the past, study the reports of the General Inspector of Rifle Practice, and, if there be a fair ratio of progress here, count not the year ill-spent. A wise rule, if it could be enforced, would restrict long-range butts to one range in ten; but when an over-confident company of managers burden themselves with the long-range elephant, they crush out the hardy growth of short and mid-range work in staggering beneath their load.

We cannot always have a great match on the tapis, nor would it be for the best interests of American practice to have such. There is enough to be done without such distracting pastimes, and there is enough doing to justify the remark that American rifle practice is growing, strengthening and solidifying, and not declining.

SHARKS IN NEW YORK WATERS.

THE case of Charles Gates, who was terribly mangled last week by a shark while he was swimming near the Erie Breakwater, Brooklyn, in the East River, has excited a great deal of alarm. Such presence of man-eating sharks in the proximity of New York is almost exceptional. About two years ago a man was reported to have been bitten by a shark off Coney Island, but if facts there were, they were in so hazy a condition that nothing very reliable could be deduced from them. In Gates' case the boy was not very far from the breakwater, when he felt one of his legs seized, and if it had not been for the coolness of his comrade, Arthur Cole, Gates would have been lost. Cole took a large stone and was adroit enough to strike the shark on the head. Even then the horrible creature was not fully induced to leave his prey, but made a second attack. Finally Cole dragged Gates out of the water. The shark's teeth had fearfully gashed the boy, inflicting some painful and dangerous wounds. From the crest of the ilium on the right side to the anterior part of the thigh, there was a wound quite eleven inches long. Over the femoral artery there was a cut, and the abdomen was gashed. On the right side the ribs showed the mark of teeth, where they had penetrated to the bone. The appearance of the wound was like that which might have been inflicted with a very dull cutting tool, for the peculiarity of a shark bite seems to be that it rather resembles a tear than an incision. In 1864 a well authenticated case is recorded of a young Brice, who, while swimming near Thirty-seventh street, North River, was bitten by a shark. The boy's flesh was torn from the thigh down to the knee, both legs having been terribly bitten. He recovered entirely, though badly hurt at the time. The shark was captured in the immediate neighborhood a day or so afterward, and measured eight feet nine inches. There is another account quite truthful, we believe, of a lad of seventeen, who, in 1865, near Greenport, while swimming in the Sound, was attacked by a shark, and after having been badly bitten was saved by some men in a schooner. Peter Johnson showed no less than thirty-four wounds, and the abdomen and groin were very much mangled, "the flesh being torn off and left hanging by the skin only, nothing but a thin lining membrane of the abdomen keeping in the entrails." Old accounts state that one hundred years ago very large sharks were found in both the North and East rivers. Mr. De Voe, the careful collector of past events, writes: "Many years ago, when sharks were taken at our wharves, and especially near the Catharine

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAMES, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 102) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2939.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 35 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, AUGUST 15, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, Aug. 16.—Beverly Y. C. Union Regatta at Cotuit, Mass. O'Donnell-Groty Sculling Race. Trotting: Mendota, Ill.; Utica, N. Y.; Geneseo, Ill.

Saturday, Aug. 17.—Beverly Y. C. Special Regatta, at Cotuit, Mass.; Union Regatta, off Strawberry Point, Mass., New Rochelle Club Open Regatta; Grand Trunk Rowing Club Club Regatta, at Montreal, Can.

Sunday, Aug. 19.—Quincy (Mass.) Yacht Club Championship Race.

Tuesday, Aug. 20.—National Rowing Regatta, at Newark, N. J. Trotting at Earlville, Ill.

Wednesday, Aug. 21.—National Regatta as above. Trotting at Newark, N. Y., and Earlville, Mich.

Thursday, Aug. 22.—Trotting as above.

Mr. HALLOCK.—Mr. Hallock is now on the Manistee River, Michigan, in company with A. B. Turner, of the Grand Rapids Eagle, Judge S. T. Holmes, and D. H. Fitzhugh, of Bay City, after grayling.

WHERE THE MONEY GOES.—A firm dealing in sportsmen's goods complains to us of the frequent receipt of abusive missives from distant and careless customers who are themselves in the wrong. The self-deceiving people who order fishing rods and flea powder, and forget to inclose the money for the same, or to give their name and address, are not the only ones given to such proceedings. We have now in our safe something like \$70, which we have received from time to time, and which, owing to the peculiarities, eccentricities and idiosyncrasies of peculiar, eccentric and idiosyncratic correspondents, is of no immediate use to themselves or to us. One man, woman, or child sends us \$4, and forgets to sign his or her name; another sends an order to some one other than the Forest and Stream Publishing Company, and circumstances combine with the United States Postal Regulations to relegate that order to our safe. All of which proves that while a word to the wise is more than sufficient, the vocabulary of no one language will suffice to instill wisdom into the heart of a fool.

or Old Fly Market, it was a treat for some old negroes, who were not long in cutting out the choice pieces, if the shark was small, for their own particular use." In 1751 the New York *Gazette* and *Weekly Post Boy* tells of three men who were upset in a canoe, when a large shark came up. The man "was undoubtedly devoured by the ravenous monster," says the old chronicler, "as he never was seen again."

In the case which occurred last week it is wonderful that no attempts were made to capture the man-eater. This would not have been a difficult task, as a strong hook and a one-half inch line would have soon done the business. That peculiar portion of the East River would have been gotten rid of a monster, and what kind of shark it was would have been discovered. We are inclined to think that the sharks which have shown their voracious instincts are the young of the white sharks, which abound in the tropics, and which find their way very rarely into our northern waters. The geographical limit of fish is always difficult to determine. We are pretty sure that it is now the ordinary blue shark, or *Squalus obscurus*, which is comparatively harmless. The white shark, the dread of the tropical seas, will grow to be 20 to 35 feet long. The largest shark is the basking shark, found in his biggest form off Iceland. But though armed with dreadful teeth, his gullet is too small to allow of his swallowing anything of size, and he is supposed, then, to be a good shark, if there can be good sharks in a social sense. These sharks have their great use in nature's economy, for all of them are the scavengers of the ocean.

There has been a great deal of discussion as to whether a shark is a ground or a surface feeder. It has been asserted of the white shark, that such is his frightful rapacity, that everything which comes within his reach possessing life is snatched up and devoured. For man this peculiar shark is supposed to have a deadly coming, and when once human flesh has been tasted, like the man-eating tiger, he always expects a recurrence of a similar prey. It is providential that he is so constructed that there are mechanical difficulties in his way of biting, and that he must turn over in order to use his fearful mouth, all bristling with fangs. Those who have noticed white sharks state that fish swimming in their vicinity are safe; but that let one of the swimmers be caught, and struggle on the hook, then instantly the shark pounces on it. When a man is swimming or floundering in the water the condition of the man and fish are alike, for they, attracting notice, apparently excite the rapacity and appetite of the shark.

HEAVY WEATHER YACHTS.

WE are in receipt of many requests, both from the coast line and the lakes, to furnish in our columns designs for deep yachts of a suitable kind that can take the open sea without danger, and that can turn to windward effectively in rough water. The present crowded condition of our pages renders it impossible for us to satisfy the demand, and our inquirers are referred to our columns in the future. The season is already pretty well advanced, and it would be impossible to launch anything new this year, but we propose making it a point to supply the requisite plans during the fall and early winter months. It is with great pleasure that we notice the increasing tendency of the yachting public toward sea-going craft. The limits of the Sound and Boston Harbor are evidently becoming too confined, and the more venturesome amateurs are extending their cruising grounds along the coast, and some of them would put boldly out to sea had they but craft under them they felt confidence in. Only recently a party of gentlemen proposed a trip around Long Island, and chartered a yacht some 45ft. long. The question with them was—and a natural one, too—can the boat stand a sea in the event of a blow from the S? Our reply was decidedly "No." What a pitiable spectacle this yacht would have cut in a gale and a heavy swell, with Long Beach for a lee shore! To go to sea and risk a blow in the yacht was sheer recklessness, for it meant nothing short of probable destruction. Fortunately, the run is not a long one, and by taking one's chances on the weather remaining fine for a day or two, it has often enough been successfully accomplished. Yet that is no proof of the sea-going ability of the centre-board sloop. Think of an unseaworthy yacht in Great Britain 45ft. long! Such a thing does not exist. A cutter of that length is fit to sail the world over, is safe, can stow crew and provisions, is handy and fast at sea. Such boats can honestly become a sailor's pride; for mere river yachts he is apt to have little love or respect. We note the gradual change in favor of the seaworthy model, then, with pleasure.

TURNFATHER JAHN.

ONE hundred years ago last Sunday, in the little village of Land, Prussia, was born Friedrich Ludwig Jahn, the father of the Turnkunst, or German systematic course of physical culture. That event was appropriately celebrated Sunday and Monday last throughout "The Old Fatherland," and not less enthusiastically by the 18,000 Turners, men, women and children, and their friends in "The New Fatherland." In Boston, New York, Baltimore, St. Louis, and a score of other cities, the two days were given up to processions and parades, calisthenic drills, athletic sports in gaily-decked park and hall; running, jumping, wrestling, climbing, feats on the horizontal and perpendicular bars, Indian clubs and broadsword exercises, and all the other muscular amusements in the programme of the Turn-Vereins. There were,

besides, the unveiling of portraits, statues and buste of Jahn, commemorative orations, declamations and poems; the singing of songs, in which the air of "Die Wacht am Rhine" blended with strains of "The Star Spangled Banner," and the drinking of innumerable toasts in innumerable schooners of beer. The lager, indeed, flowed continuously, toasts or no toasts.

Ludwig Jahn, the hero of all this gymnastic, intellectual and gastronomic outburst, was graduated with distinction at the University, and was destined by his father, a Lutheran clergyman, for the ministry; but young Jahn, having served his time with credit in the army, and, seeing there his country's need of more stalwart sons for the national defence, set about developing the Teutonic muscle. At his suggestion classes of physical culture were established in schools and in the army, of which he was appointed the general inspector. Then came the establishment of the first Turner Society, and these gymnasia rapidly multiplied throughout the various parts of Germany. Political trouble came, and with it a term of imprisonment, and the suppression of the schools on a charge of liberal tendencies. But our hero finally found his way out of his embarrassments and his prison, and the value of his life-work to the nation was publicly recognized by a permanent pension. Jahn died full of years and honors in 1852. A monument in Berlin commemorates his life and services. His best monument is his admirable system of physical training, whose principles and practices he taught, and the stalwart Teuton frame, which has been no mean factor in the recent history of the German people.

"OLD ABE" VINDICATED.

NOT a feather of his plumage would we ruffle, and we hasten to refute the slanders concerning the veteran old war eagle of the Dunn County, Wis., soldiers. Here in America we refuse to have any national heroes among the men who, in war and peace, have served their country, and the brutes who have won for themselves a transient place in the crumbling niche of fame, must be content to fare no better. The Steed of Odin may be sung in the Sagas of the Norsemen, but of the hero of "Sheridan's Ride" the General himself has remarked that had the poet seen the poor wreck of a horse which figures so valiantly in rhyme he would never have written the poem. The vigilant Geese of the Capital may be accorded immortality by grateful Romans, but an American bird, be he goose or eagle, may not hope for untarnished fame. In the ill-natured breast of some unscrupulous iconoclast has arisen the widely current charge that the eagle of the Centennial was not only not the only true and original "Old Abe," but that he was no eagle at all, but a gull.

Wisconsin veterans read the papers, particularly the *Forest and Stream*, and their watchful eyes have been quick to detect the newspaper stories reflecting upon the fair name of their old war friend. In no uncertain tones do they demand an investigation of his record, and a recognition of his and their own integrity. Moreover, the whole State of Wisconsin is behind them, prepared to substantiate and enforce the claim that "Old Abe" shall not be relegated to the category of woolly horses and stone giants. The piercing eyes we saw at the Centennial had scanned the field of battle. The photographs we bought were those of the real hero, now full of grey feathers and glory.

Last year "Old Abe" attended the reunion of the veterans of Dunn County, Wis., as he will do again next month, and was then among members of his own company, all of whom recognized him by certain peculiarities and wounds. Among others, Mr. David McLean, who was for a long time one of his bearers in the war, saw him, recognized him, and was himself recognized in turn by the eagle.

Peace to his declining years. Our readers shall hear from him again.

[FROM OUR OWN CORRESPONDENT.] THE MOUNTAINOUS REGION OF VIRGINIA.

ORKNEY SPRINGS, SHENANDOAH CO., Va., }
August 2, 1878. }

EDITOR FOREST AND STREAM:

Driven from Washington by the oppressive heat I sought the cool and invigorating atmosphere of Orkney, at the base of North Mountain, 2,900 feet above tide water, where I have been residing during the past month. Man requires relaxation from the cares of a busy life, and to my mind there is no more rational way of adding to the vigor of his mental, as well as his physical, condition than by enjoying the sports of rod and gun, which must lead him to commune with nature, study all her revelations, "and look through nature up to nature's God." Would that it were possible for me by any florid word-painting to describe to the ardent and enthusiastic admirer the scenery of this charming country; the pleasure experienced ere the morning sun appears above the neighboring mountain-top, as I throw open my chamber window to hear the feathered songsters usher in the matin hour. Here they are unmolested by the rude hand which so often drives them from the neighborhood of thickly-settled communities. Here the mountain-sides echo the songs and chirpings of the thrushes, fly-catchers, vireos, finches, buntings, grosbeaks, and chats flitting from tree to tree, scattering the dew-drops in tiny showers. Here the little chipping sparrow, *spizella socialis*, hops upon your window-sill, in joyful expectancy of his morning meal. The grateful odor of the woods, the balmy and bracing atmosphere as the morning sun illuminates the

oazy mountain-top are pleasures which form a lasting impression upon the tablet of our memory.

The surrounding country is filled with game of every description. Far up the mountain-side, where he is seldom disturbed by the intrusions of man, dwells the black bear, *Ursus americanus*, living upon berries, acorns and such other food as he can find; but sometimes he boldly descends from his mountain fastness to raid a neighboring corn-field or turnip patch, or perchance the farmer's pig-sty may receive a call from Bruin, who, never averse to a dainty meal, helps himself to the first little porker he meets. One of the characteristics of the black bear is his delight in a cold water bath, and if a pool does not happen to be convenient, a mud-hole will answer his purpose. The principal spring at Orkney, the mineral ingredients of which are sulphates of magnesia and iron, is known by the euphonious name of "Bear Wallow," because it was herein that they rolled and weltered ere the encroachments of man drove them from the valleys far up the surrounding mountain-sides. In the cold water bath, too, deer, *Cervus virginianus*, range over the forest-covered mountainsides and enjoy their noonday siestas in undisturbed tranquillity; but as my experience in the pursuit of this game is somewhat limited, I will not attempt any description of a deer-chase here; rather would I interest your readers in the smaller game, so abundant in this section. The wild turkey, *Meleagris gallopavo*, finds here plenty of cover wherein to roost unmolested. That game and delicious bird, the autocretic turkey, *Bonasa umbellus*, the wildest but most desirable of all our game birds, struts over his rough haunts beneath cover, almost impenetrable to man, but frequently leaves his secluded abode for some grain-field in the vicinity, wherein he is often flushed and killed. In this section they are hunted to a great extent on horseback, and when flushed in the woods light upon some neighboring tree, from which they are easily and gracefully dropped. This manner of killing them may be considered unsportsmanlike by some, but I am not of that opinion. When we remember that the grouse will not lie to a dog; that oftentimes the only knowledge we have of his presence is the sudden whirr when he gets up, *sans ceremonie*, and darts through the thick woods. To my mind it is legitimate to drop him on sight, no matter whether we find him strutting over his ground, pluming himself, or dodging through the branches of trees. All over the mountain-side the piping of the timid gray squirrel may be heard, and these dreamy summer days, from the valleys below, comes the piping of Bob White, *Ortyx virginianus*, the gourmand now reveling in the stubble fields, from which the golden grain has just been garnered. All down the rich Shenandoah Valley, over hundreds of a stubble field, the partridge disports, unmolested by man, fully protected by the art game, and in my state, which forbids a warfare upon his species until the first of November. But soon "the autumn, all in yellow clad," will be here, and the thoughtful sportsman will not forget this epistle. The close season for ruffed grouse expired on Thursday, August 1. The young birds are now well grown and exceedingly juicy. The close season for deer expires on the 15th of October. There have been no heavy storms this summer to drown young partridges, and, brethren, we may look forward to good shooting when the leaves shall have withered and the groves "shine with silver frost."

Among the sports much enjoyed by several of the guests at Orkney, is that of catching frogs in Stony Creek, a small stream near the springs, in which large ones suitable for the table are often captured. I may be called a frog-eating Frenchman by those who are prejudiced against frogs, but I do not object to the appellation, as my state forbids the use of mercurial Gault; but I could never understand why this prejudice should exist. It will not be denied that the food of a frog consists of insects and various water roots and grasses. He is much more fastidious in his tastes than a duck or even a chicken, and his liver is more palatable than that of either. However, it is not my purpose to enter into a disquisition as to the delicacy of frogs. Most sportsmen will agree with me that a properly cooked frog makes a most savory dish. Our frogging expeditions are generally managed by Mr. Chas. P. Gautier, of Washington, who is an expert in grabbing frogs, which must be done skillfully, or he gives a sudden squeak and disappears. The only implements necessary for a frogging expedition are an ordinary lantern with a reflector behind it, a stick five or six feet long with eighteen inches of stout wire attached to the end, and a light angle with the stick. To this wire a closter of three or four hooks is fastened, with which the frog can be taken when beyond arm's length. A stout canvass bag, in which to carry the captured frogs, with a cord fixed in the opening so as to close it quickly, completes the outfit. As to dress, any old garments will do, with a heavy pair of wading boots. The frogs, during warm nights, sit upon the banks of the stream and about pools. To capture them it is necessary that the hunters make as little noise as possible. Of course they must wade the creek, one with the lantern leading, and another to grab the frog following in his steps. The light is thrown upon either bank of the stream, which blinds the frog, and he is easily discovered by the white beneath his lower jaw, which shows conspicuously. If within reach he is suddenly grabbed and shipped into the bag; or, if his position be such that he cannot be readily taken up with the hand, the stick and hooks above described, if properly manipulated, take him from his element. The next sport is in removing the frogs from the bag to skin them, and a good deal of skill is required to prevent the whole number from hopping out at one time. The skinning process is performed by cutting around the neck and holding the frog by the head with the left hand, stripping the skin from him with the right; then hand him over to the cook.

R. F. B.

[FROM OUR OWN CORRESPONDENT.] GLORIOUS OLD GLOUCESTER, VIRGINIA.

WARE RECTORY, Gloucester Co., Va., }
August 2, 1878. }

EDITOR FOREST AND STREAM:

Your correspondent finds himself in the very pick of all the counties of tide-water Virginia. Talk about the Garden of the Gods in Colorado! why, here is the true Garden of the Gods. Those mundane and real gods I mean, who know how to enjoy the best gifts of the Creator and to appreciate the happiness of this subliminary life. Indeed, Gloucester and Matthews Counties are favored spots of earth for all who love what the water, the air and the fertile soil bring forth.

Get a good big map of Virginia and hunt for Mob-Jack Bay, called in Capt. John Smith's time Mock Jack Bay, because it did so puzzle the seaman with its manifold tributaries. You

Four prizes:

L F Garlock	53	46	111	H Hamilton	52	35	98

tell about it he adds another 100 yards to it to be sure of doing himself full justice. Now, the fact is that the deer was just about 200 yards, and the man who had no idea of distance, or took no time either before or after shooting to look over the intervening ground, or else it was of a nature to deceive him if he did. He only knows that he made a very fine long shot, and jumps at the distance through a fancy already misguided by the stereotyped forms of exaggeration to which he has been accustomed. But in the main fact—that he made a long shot, he is eminently correct, for 200 yards is a long shot on a deer with any rifle and on any ground, except the open plain, and it's a mighty good shot even there.

A good way to judge of what can be done in this way is to look over the 200-yard scores of the best Creedmoor off-hand riflemen; and here I may say, notwithstanding the popular belief to the contrary, that these scores are as good average scores as can be made by any one. The unquestionable superiority of the "Leather-Stocking" in shooting on game is because he can shoot about as well on game as he can at a target, which the mere target rifleman, however expert, cannot do for want of the coolness and knowledge of some few points, which he can acquire only by experience in the field. Now, take the best of these scores, and recollect that it requires a 5-shot to kill with certainty; that nearly one-half of the 4-shots will miss a deer, or only break his leg; that almost every 3-shot will miss him; and that these scores are worthless. Then, in my mind, too, that these scores are made at a distance already known to a foot, and with a sight set to within one-hundredth of an inch at the greatest, and generally much closer, both of which conditions are unattainable in the field. Remember, also, that the white bull's-eye of eight inches, on a dark ground, is easier to hit than a twelve-inch one of the color of game on the background upon which (except on snow) is generally seen.

Now, the long-range bull's-eye is almost indispensable to use in our .40-calibres to have weight enough to be effective on large game in all positions begins to fall perceptibly from the line of the level sights at about 70 yards; at 100 yards is down some eight or ten inches; at 150 yards is from twenty to twenty-five inches below, and is then dropping about ten inches for the next twenty-five yards, and this drop rapidly increases. Except on snow, I know of no other principle upon which I do not claim to be perfectly taken to these figures, and I am sure that I know of no other. But what can one proceed to "bounce" me for my audacity in making such an assertion, I would suggest that he try the experiment at measured distances, with rifle sighted and held as he would sight and hold it to cut a squirrel's head at thirty paces.

This drop of the heavy ball cannot be overcome to any useful extent by increasing the charge of powder. I have never fired a Creedmoor bullet, yet I will venture to say, both on principle and on analogy, that its ball will fall seven inches at least at 100 yards, and I believe more, and at 150 yards will fall at least eight inches in twenty-five yards. The result of this drop is that at 200 yards a mistake of twenty-five yards either way, in the estimate of your distance, will cause you to miss a deer or antelope nearly every time, or only break a foreleg (rough, perhaps, both legs). Any one who will fire a 200-yard shot, even on open ground, with plenty of time to look over the intervening space, can readily see the difficulty of avoiding it in rough, brushy, hilly or timbered ground. And both the drop of the ball, and the difficulty of estimating distance, increase constantly with the distance, the latter trouble increasing at a geometrical ratio.

That very long shot on game are occasionally made is beyond question, and there are three ways in which it is done: First, by "scratch" shots; second, by game standing for sighting shots; and third, by skill in the calculation of distance, wind, etc. By scratch shots I mean such as Judge Gildersleeve speaks of in a late letter to the *FOREST AND STREAM*—killing a duck at half a mile. Just ten years ago last December I killed one out of two fish-ducks at the foot of Lake Pepin, and at over that distance at the very first shot. Five months later I fired at a bunch of gulls on a shore-bar, that were huddled in a space of about ten feet, and killed two with one ball. The bar was half a mile up the river by the bank, and about 500 yards from shore at that point. Both these shots were seen by several persons. They were made by a .40-cal. Maynard's rifle, which can not to-day be beaten or easily equalled by any rifle of its calibre and weight. I have no doubt that just such shots have been made by every one who has shot much with a long or mid-range gun, and there is no reason for doubting them; but when you come to draw any inference from them I protest. They prove scarcely anything, except the distance to which the rifle will throw the ball. Until a man can make such shots at least once in five or six times, they must be considered more a considerable element of skill in consideration, even though a considerable element of skill in consideration as pure accidents, as much as if I had carved off the head of a flying bird by throwing a jack-knife at it, although I must confess that I didn't say so to the bystanders.

The second way is by game standing for sighting shots. Where game is hunted but little, where you get in high above it, where the man who has the gun is such that the echo will bother it if it does not see you; and often, if it does see you, but can't make out what you are, it will stand either entirely still, while three or four balls strike over or under it, or else will only jump a few steps at each shot. In such a case the advantage of the breech-loader over a muzzle-loader, which might be a trifle more accurate, is immense. I have in this way killed several deer, and 200 yards, one at 350, and taken a leg on another at half a mile. But when a man has such things he generally takes good care not to tell how many sighting shots he fired before he hit it; and in the present case I shall follow the prevailing fashion, except to say that each time there were two tools well met, and the deer happened to be the biggest fool of the two. I ran the risk of losing every one, and could have got them more certainly in another way.

The next way is by skill in the calculation of distance. Upon open ground, with a few seconds of time, it is comparatively easy for an experienced shot, with a good rifle and proper sights, to calculate distance, four times out of five, close enough to hit a deer or antelope up to nearly 200 yards. This skill may be so cultivated as to make one pretty sure at 250, and sure enough to be worth trying at 300 yards. Forek I should think fifty or seventy-five yards might be added to these, and for buffalo another fifty or seventy-five. And these I consider the extreme outside ranges for practical game shooting, although where there is slight hope of getting closer, and firing will not dis-

turb other game, it would, of course, be advisable to try it much further. But when you come to estimate distance up hill, down hill, through timber and over timber, through brush or over brush, across canyons, ridges, etc., it becomes a vastly different matter. There is, of course, no telling what could be done by the expenditure of barrels of ammunition, but I believe that nothing short of an extraordinary expenditure of ammunition and patience will enable a man to estimate distance upon such ground closely enough to do it. Limited time it must generally be done to hit a deer at 200 yards at the first shot over one-half the time. No matter what your skill in one kind of ground, your gauge unconsciously shifts when you come to another kind. Especially is this the case in the mountains. The gauge you use to day in the plain, fails you to-morrow in the foot-hills; and the gauge you adopt in the low foot-hills is too small when you are among the rugged ones, and your standard for them fails again when among the high peaks. Byron, speaking of the interior of St. Peter's, at Rome, says:

"Its grandeur overwhelms thee not;
And why? 'Tis not lessness, but thy mind,
Expanded by the genius of the spot,
Has grown colossal!"

Who, that has been among mountains, has not felt this and been astonished at the over-shifting deceptiveness of height and distances? And now arises a very important question: When shall I risk long shots and try to get closer? Circumstances vary so that a satisfactory answer is of course impossible. If game has taken the alarm it is generally advisable to crack away at it, unless the wind is right and nature of the ground is such that you can keep out of sight, semicircle and get around or above it without losing much time. Where game is not alarmed and the country is at all rolling, any real good hunter, shed with moccasins, will be about to get within one hundred yards of deer four times out of five, unless under special circumstances, such as crusty snow, thick or dry brush or leaves, etc. I am "no slouch" on guessing distance and shooting up to four hundred yards, yet for every deer I have bagged at over one hundred and fifty yards, by virtue of having an accurate mid-range rifle, I am sure I have lost three by being beguiled into opening fire and scaring them away at the first shot, when, if I had kept my rifle close, I should have got much closer. If I had always had a rifle that would, I know, not shoot an inch beyond one hundred and fifty yards, I should have killed more deer than I ever have by twenty-five per cent. So firmly convinced have I become of this, that I long ago adopted this rule, which I would suggest to every beginner, not only as a rule that will insure him more game, but also make him a far more skillful still hunter. The rule is: Never shoot a deer beyond one hundred and fifty yards, unless there is one chance in three of getting forty or fifty yards closer, and whenever you are in any doubt as to whether to raise your sights or not, always keep them down, with the single exception of shooting across water or a broad bottomed canyon from the hills above, in which cases you are more likely to under-estimate than over-estimate distance.

The long-range delusion rests almost entirely upon mistaken ideas of distance, and is only appearing to be almost invariably only appearing to be twice as far to most people as it really is. Nearly all are deceived by it at first, and many never can get over the tendency to be deceived. One thing that confirms the fallacy in the minds of many is this: Let any man who is anything of a shot and knows anything about distance, fire a good long or mid-range rifle at any far off object either on land or water. Two chances to one he will be close, just over it or just below it, and he will be right into or just over it.

"Jupiter!" exclaims a bystander, "that was a mighty close call! How that would have tickled a deer! Eh?"

"You bet," says the shooter, really believing it.
Now here are two mistakes. First, it wasn't a "close call," for, though the variation seemed but a few inches, it was really a few feet. Secondly, even if it were a close call, if there is any one fact about rifle shooting which may be considered established beyond dispute, it is that "close calls" will not kill game. That requires a bull's eye every time. It is almost needless to add that the difficulty of long-range shooting cannot be helped much by using a telescope sight. Though very good to hit marks that would be nearly invisible through common sights, it is just as necessary to know your distance in order to adjust it, and it is better to be kept off, as it is difficult to find your game through it unless the light is very good. It might be used, however, to advantage by some of our long range performers to draw the game up close enough to allow them to reach it before it spoiled, though even then I should recommend the use of sailed bullets to make sure of its preservation.

I have just seen the article of "Viator" in *FOREST AND STREAM* of Feb. 1, on "Double-Barreled Rifles." Such a rifle and ball as he there describes would increase by some seventy-five yards the distance at which one may shoot, with a great approach to certainty of hitting, and paradoxical as it may seem, would be a longer range hunting rifle than one that would throw a ball double the distance it can. The distance at which we can shoot without raising sights, ranging high at all sights, taking coarse front sights or holding over game (all equally delusive and vexatious), would be vastly increased, while it would shoot well enough at five hundred yards to take the conceit out of any target shot who thinks he can do as well at that distance on a target with hair on it as he can on a bald target. It would also greatly increase the distance at which running game can be hit without holding ahead of it, and as well as diminish the distance necessary to shoot about as well as to take down the entire West in pigeons, glass ball and prairie chicken shooting—the elegance of its apparel will, no add to his already fascinating appearance. Shelton's sporting suits will stand all kinds of usage. They are made by a practical man, and are wonderfully convenient.

AN ELEGANT SHOOTING SUIT.—For an elegant and serviceable dress for a sportsman, we recommend most particularly, not only the material, but the neatness and convenience of the suit made by F. L. Sheldon, of Rahway, N. J. Just such a suit is now in our office. It is of a rich brown velvet corduroy, and made to last. There is no possibility of its making up a suit of clothes so that when a man is in it he looks like a gentleman for whom the clothes were made—who is going to take down the entire West in pigeons, glass ball and prairie chicken shooting—the elegance of its apparel will, no add to his already fascinating appearance. Shelton's sporting suits will stand all kinds of usage. They are made by a practical man, and are wonderfully convenient.

Game Bag and Gun.

GAME IN SEASON FOR AUGUST.

Woodcock, <i>Phalaropus minor</i> .	Red-backed sandpiper, or ox-bird, <i>Tringa americana</i> .
Black-bellied plover, ox-eye, <i>Sylvia fusca</i> .	Great northern diver, or marlin, <i>Larus fovea</i> .
Ring plover, <i>Agallitis semipalmatus</i> .	Willow, <i>Tadania semipalmatus</i> .
Sooty, or long-shanks, <i>Ilomantopus nigricollis</i> .	Taylor, <i>Tadania melanoleuca</i> .
Red-capped snipe, or dowitcher, <i>Macrophys pusillus</i> .	Yellow-shanks, <i>Tadania flavipes</i> .

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicola* or Shore Birds. Many States permit prairie fowl (plains grouse) shooting after August 15.

GAME AT THE WEST.—The coming shooting season is most promising for all kinds of game, and the coming Bench Show and Field Trial in Minnesota are attracting a large number of Eastern sportsmen, who will find an abundance of prairie chickens, plover, mallard, teal, wood ducks, etc. Deer are most abundant in Wisconsin, Minnesota and Michigan. The best localities in Wisconsin may be reached by the Wisconsin Central Railroad, between Phillips and Ashland, and by the Chicago and Northwestern Railroad beyond Elroy; in Michigan, north of Reed City, and by the Flint and Pere Marquette Railroad, between Reed City and Saginaw. The Northwestern branches also penetrate to many desirable shooting grounds.

QUEBEC—Matapedia, Aug. 6.—Ruffed grouse and other small game is very plenty in this vicinity, and signs of moose, caribou and bear are reported to be numerous within a short distance of Frazier's Hotel. STANSTEAD.

NEW HAMPSHIRE—Georgesville, August 5.—The forests hereabouts are filled with grouse, and there are great numbers of duck in Lake Memphremagog during August and September. Later in the fall wild geese are to be had. D. W. A.

MASSACHUSETTS—Wareham, Aug. 9.—Shooting prospects are very good for this season. CROSSLAND.

Salen, August 12.—A sickle-bill curlew was picked up one day last week on Bufton street, Lynx; had been hit and finally fell exhausted. Among the birds recently brought to bag by friends and myself have been summers, snipe, grass-birds and some peeps, as usual. Uplands are in good order, but will be better in a week. Rainy weather makes it better for gunners, as I think showery weather makes birds move after or between them, i. e. if there are any *en route* for the South. Am going out this afternoon, if weather allows, to try some uplands in Gallow's Hill pastures. Grounds hang-up for Wilson snipe. R. L. N.

Nantucket, Aug. 10.—Birds are coming along in fair numbers. Thursday I went up harbor and made a fair bag of curlew and yellow-legs. JACK CURRY.

MONOMONK SPORTING CLUB.—The annual election of officers of the Monomank Sporting Club of Gardner, Mass., last week, was as follows: Pres., Aaron Greenwood; Vice-Pres., John D. Edgell; Executive Committee, Thomas Greenwood, George Nichols, Marcus Wright. The club will start upon its annual excursion September 3, and be absent ten days.

RHODE ISLAND—Newport, Aug. 10.—Good shooting for this vicinity. One day this week the guns brought to bay 11 grass plover, 3 woodcock, 9 yellow-legs. OCCASIONAL.

Newport, August 12.—Woodcock and plover are being shot with very good success, shooters getting to bag from ten to ten birds. T. J. L.

NEW YORK—Bluff, August 8.—Deer and small game as plenty as usual. A good season's sport is anticipated. I. M. B.

LONG ISLAND—Jamaica Bay, August 13.—A few flocks of yellow-legs; ring-necks and surf snipe plenty; one black duck seen on the 11th; weakfish and striped bass fishing first rate; any quantity of crabs. HANET.

PENNSYLVANIA—Erie, August 10.—Woodcock shooting has been very good this season. Mr. T. W. Jarocki and myself bagged 18 fine birds last Thursday. They are beginning to molt now, and we have all agreed to let them alone until after they get through. SISKIE.

TENNESSEE—Nashville, Aug. 8.—A great many sportsmen are out every day, and some excellent bags of doves are made. I heard of three gentlemen who killed forty, one afternoon, and yesterday Mr. Valentine and two friends in a short while bagged a dozen. V. scoring eight to his gun out of the twelve. There is not the usual prejudice against killing doves and robins as there is in many places, and both birds are considered delicacies. The flesh of the dove is dark and resembles the pigeon, except that it is more delicate. J. D. H.

MICHIGAN—Detroit, August 8.—J. E. Long, in three days' shooting Monroe last week, killed 70 woodcock, William Jardine on July 30 killed 17 woodcock. DRAID.

MINNESOTA—Monticello, August 3.—Prairie chickens and ducks are very plenty in this and adjoining counties. We expect great fun the latter part of the month. J. P.

INDIANA—Blairstown, Aug. 3.—Quail and grouse are plenty and promise good sport this season. A. A. W.

IOWA—Pomeroy, August 6.—The show for good shooting was never better than now, especially on pinnated grouse. They are a month earlier than usual, many being now full grown. There is any amount of shooting going on now in open, barefaced distance of the law, and that too by men of whom one can expect no more sportsmanlike or courteous behavior. We have no club of any consequence as far as enforcing the law goes, and as no one makes it his particular business to see to

Sportsmen's Goods.

SPECIAL NOTICE

TO

GENTLEMEN.

We have just received a direct importation of East India novelties, to which we desire to call attention:

- 1st. 25 pieces pure Corah Silk, a delicate fabric of soft, creamy shade, which we sell by the piece.
- 2d. 25 pieces real Seersucker, which was made in narrow stripes expressly for us. We shall make suits to order, and keep in stock Back Coats ready made during the month of August.
- 3d. Chogas.—A few of these fine embroidered Camel's-Hair Smoking Jackets for gentlemen, such as we offered two seasons ago.
- 4th. 25 pieces Pure Pongee Silk. These silks, made into suits, we offer as the coolest and most attractive summer garments for gentlemen ever shown. Price only \$11 per suit.
- 5th. 50 sets of Pijamahs and Cobias—or East India Sleeping Dresses. These were made to order in Canton, and are very handsome and desirable, at same time inexpensive. Last season we sold the suits at \$15. This month we offer them at \$9.
- 6th. 30 pieces genuine old fashioned Nankeen. This we sell by the piece or make to order into suits for gentlemen or children.
- 7th. A few dozen East Indian Silk Sashes, to be worn with Children's Summer Suits. These are very fine in quality, but very cheap. Price \$2.

G. W. Simmons & Son,
OAK HALL, BOSTON.

WE ARE THE ONLY MAKERS

OF THE

BOSTON SHOOTING SUIT.

Each garment and every button bears our name and address.

The reputation of these goods is now established throughout the country.

They are the Best.

PRICE PER SUIT, \$13.

Painting.

PAINTING.

EVERY ONE THEIR OWN PAINTER.

50 Per Cent. Saved.

We are manufacturing a Pure Ready-mixed Paint, mixed in such a manner, that any ordinary stable or farm hand can make a good job of painting. This is because our paint does not set quick, and thus show marks of the brush. We sell it lower than materials can be bought in the ordinary way, and our recent success has proved it.

Any one wishing to Paint, will have mailed free, upon application, our book—How Every One can Paint and Select Harmonious Colors. Address INGERSOLL PAINT WORKS, South and Dover streets, New York.

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot-gun can be converted into a most accurate rifle. The AUXILIARY BARREL will fit any standard make of gun of 10 or 12-calibre—calibre of rifle 22, 38, or 41 as desired. Length of barrel, twenty inches. The shells used with the best advantage are the Winchester Repeating Arms Co.'s cartridges, No. 32 and 35, extra long, and No. 44, model 1873. Send for a Circular and Price List.

THE WINNING GUN.

At the International pigeon shooting, Monaco, Feb. 1873, the Grand Prix de Casino, an objet d'art valued at £100, and a money prize of £705, was the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Cholmondely Pennell, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 23 yards and 1 foot and 20 1/2 yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This acknowledged to be the best shooting on record. The winning gun at the choke-bore match, 1871, beating 17 guns by the best London makers, and winning the silver cup, valued at 60 guineas, presented by Mr. J. Purdey, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 58 birds out of 100, using one barrel only.

The winning gun also at the great London Gun Trial, 1878, beating 102 guns by all the best makers of Great Britain and Ireland. THIS PATENT TROUBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 6, 1875; No. 164,323. BEWARE OF INFRINGEMENTS OR IMITATIONS.

Medicinal.

BRANDRETH'S PILLS.

We believe these celebrated pills are pre-ordained by their inherent merits to be the medicine of the world. They impart a power by which every organ of the body becomes healthy. Nature has formed the bowels so that they are capable of drawing to them the impurity of any organ of the body, how ever distant. So we have little more to do when we are sick than to purge freely with a medicine time has proved will not hurt. This treatment always quickly restores a health when adopted in time.

BRANDRETH'S PILLS

cure both constipation and diarrhoea. Ask the man who was lying from constipation & who was cured him; he is your Brandreth's Pills. Ask him who had dysentery 7 months what cured him; he says Brandreth's Pills. They are the best medicine for all the ailments of the bowels. A case occurred recently where Brandreth's Pills cured a deep ulcer of the foot, which the doctor said could only be removed by amputation; yet twenty-five boxes cured it and restored the patient's health. Reference W. M. Skinner, of White Plains.

Brandreth's Pills are a vegetable medicine, but a scientific preparation, which have been prepared by the present proprietor for over fifty years. They are wholly composed of the most pure and vegetable essences, are invariable of hurting the most delicate, yet so as to cleanse the bowels and bid adieu to a curative effect upon every form of disease. Where for twenty years the patient had no movement of the bowels without medical or mechanical means, a month's use of Brandreth's Pills effected, restored the bowels to regularity.

The secret of recouling the vital principle is discovered in this medicine; it generates and increases healthy animal warmth. Provided the great organs are not irreparably injured, there is no disease Brandreth's Pills will not cure. Remember, they concentrate the vitality of the system to effect the disease wherever located in the body.

BRANDRETH'S PILLS

are sold by all dealers—25 cents a box, either sugar-coated or plain—and at Dr. Brandreth's

PRINCIPAL OFFICE,

281 CANAL STREET, NEW YORK.

STOP AND READ.

All forms of Kidney diseases, Pains in the Back, Sides and Loins, are positively cured by

GRANT'S REMEDY.

Its effects are truly marvellous in Dropsy, Gravel and Bright's disease. No matter of how long standing the case may be, positive relief is had in from one to three days. Do not despair, hesitate or doubt, for it is really a specific and never fails. It is purely a vegetable preparation. By its timely use thousands of cases that have been considered incurable by the most eminent physicians have been permanently cured. It is also endorsed by the regular physicians and medical societies throughout the country. Sold in bottles at two dollars each, or three bottles, which is enough to cure the most aggravated case, sent to any address on receipt of five dollars. Small trial bottles, one dollar each. All orders to be addressed to

ROD AND GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

Terms, Four Dollars a Year.
Ten Cents a Copy.

NEW YORK, THURSDAY, AUGUST 22, 1878.

Volume 11.—No. 3.
(No. 111 Fulton St., N. Y.)

For Forest and Stream and Rod and Gun.

In The Wilds.

ON the 15th of last October I left Camp Kennebago, Rangeley Lake, Maine, for Megantic and St. Francis Lakes, Canada, via the Wilderness. My system was fully charged with the terrible malaria, imbibed during the six months mainly spent at the Philadelphia Exposition of 1876. A month's stay at Camp Bena, on Mooselucmaguntic Lake, had not effected a cure, and friends and physicians advised a hundred-mile tramp through the wild woods of Maine and Canada. Accompanied as a companion by that sterling gentleman, E. A. Rogers, Esq., of Rangeley, Maine, whose courtesy is so well known to many anglers, sportsmen and tourists, and with the famous Captain F. O. Barker, of Andover, as chief guide, and Stephen Taylor and Addison Long, of Byron, and Frank Hovey, Jr., of Rangeley, as packers and oarsmen, we went by Canopic Lake and stream and the Five Mile Carry to Parmachenee Lake. We were cordially welcomed by Uncle John Danforth at his unique camp on a raft, anchored in the middle of the lake, and in a short half-hour made a clean sweep of his well-supplied table, the prominent and most delicious dish being "beaver hash." Having reached the region famous as the ranging ground of deer, moose and caribou, of which I had heard for the seventeen years during which I had frequented the Rangeley Lakes, I interviewed Uncle John immediately after supper as to the probability of my getting my first shot at a deer. "Oh, yes," he replied, "I can give you the opportunity to-morrow morning." With full faith in Uncle John, I retired to rest and slept sweetly, gently, but literally "rocked in the cradle of the deep." Awaking early and breakfasting at half-past seven, we sent two guides ashore. At 8 o'clock we heard three shots. Springing into our boats we started from the camp. As we rounded the point of an island a half-mile distant we saw a deer swimming. As we approached I exclaimed, "Fred, that is a caribou!" He turned. "A look was enough. The forest of branching antlers looming five feet in the air, together with his great length and the exquisite dark-gray color of his skin informed his practiced eye that a veritable specimen of the American reindeer was before us. He swam rapidly, but not with the speed attained by our Adirondack boat, propelled by the muscular arms of Captain Fred. At long range I fired my first shot at a member of the noble deer family. Eleven hundred-shot rattled around him, but only served to quicken his speed and turn him directly toward the shore, but a short distance away. I urged Fred to increase his speed, and still standing in the stern of the boat with the gun at my shoulder I calmly awaited the moment for the last shot. "Fire!" shouted Fred, as he glanced at the noble animal now within close range. "Not yet; I don't want to ruin those antlers with the twelve hundred-shot in my left barrel." Aiming steadily at the line formed by the broad neck and rippling water I pulled the trigger. Almost at the report he ceased swimming. The majestic head slowly dropped, and as the antlers touched the surface of the lake I was alongside and caught the upper one in the crook of my right arm. "All right, Fred; I told you ten minutes ago that was my caribou. Now for the camp." The other boats came up and in tow line we returned to the camp. It was half-past eight as we touched the raft. The hunt was exactly an hour. The next morning as we set out for Lake Megantic, Uncle John's assistant, Perry started for Colebrook, N. H., sixty miles down the Magalloway. He carried the head and the antlers, the skin, the feet and the two hind-quarters of the caribou, which were expressed to New York. A rustic sign over the main entrance of Uncle John's camp on the raft, placed there by our hands, reads, "Camp Caribou."

We had many delightful and exciting experiences during our three weeks through the wilderness to the Lakes Megantic and St. Francis and return to Rangeley, and I may tell them down for the entertainment of your readers. Suffice it to say that the main object of my trip was accomplished. I returned home fully recovered. No lingering evidence of malaria was left in my system. I can therefore earnestly recommend a similar tour to the victim of this widely-prevalent malady.

All this is preliminary to the presentation of an exceedingly graphic account of a trip just made over the same ground and extended to Quebec and Montreal by Captain Fred. O. Barker and his colleague, Uncle John S. Danforth. So far as I can learn no one but the Indian, hunter or trapper had ever crossed the boundary at this point previously to our "first Megantic ex-

pedition" of October and November, 1877. It is perfectly feasible for any one, and I can cordially recommend to the sportsman-angler desiring to visit an entirely new hunting-ground, and one abounding in moose, caribou, deer and bear and trout, this section of our country.

The diary which follows is sent to me from Camp Kennebago, Indian Rock, Me., July 24, 1878:

"Our trip through the wilds of Maine, New Hampshire and Canada was proposed in May, but not decided upon until the middle of June; and on the 11th of July, leaving the steamer *Ojosses* and Camp Caribou in the hands of trusty men, we left Camp Kennebago at 7 a. m. and took the Barker and Janforth route for Parmachenee Lake, arriving at Camp Caribou at 3 p. m., where we packed our knapsacks with suitable provisions and also stopped over night. At 6 a. m. the following morning, taking a boat as far as Little Boys' Falls, a distance of two miles, where we put on our packs and, taking our rifles in our hands, struck into the woods.

We took a northern course for several hours, then turned toward the east until we reached the boundary line between Maine and Canada, which is marked by an opening cut through the forest thirty-three feet wide. Then we turned again, this time toward the north, and traveled for several hours until we reached Arnold's Bog, one of the wildest places in Maine or Canada. Here we stopped at one of our camps, and, catching out for supper (which took us only a few minutes), we retired to rest. For our camp-fire, then got supper. The day was nearly gone, but the moon being nearly on the full, we concluded to take a sail in the 'Crow's Nest,' which is a large nest-like platform, made in the top of several trees, and so situated as to give the occupant a view of nearly a thousand acres of the feeding-ground of moose, caribou and deer. We got seated in the nest just before the moon rose, but did not hear the sound of any animal until nearly 11 o'clock; but then there was lots of noise. The animals were just coming down to feed, and in less than thirty minutes we could see several deer, three caribou and three moose. We could have had several shots, but patiently waited for a bull moose, and in less than an hour there came within good range one of Canada's best, and we did not let the chance slip; and when the signal was given, which was one, two, three, we both fired. There was a general stampede all over the Bog. The one we shot at tried to do his part of the running, but in going fifty yards his mighty strength gave out, and he went down with a crash. We slid down from our nest, and, after examining the animal, found the holes of two balls, so neither could claim the shot that did the deed. The remainder of the night we spent in taking off the hide and taking care of the meat, and before we slept we went to where there were a party of St. Francis Indians in camp and gave them the most of the meat. Then we returned to the camp, and, after eating a square meal, we rolled ourselves in our blankets and spent the most of the day in sleeping. We did not leave camp until the next morning at 4:30, with our packs well strapped on, and all day we traveled north. We saw one caribou, but did not care to shoot it as we did not need the meat. At 6 p. m. we stopped for the night on a mossy knoll near the bank of Arnold's River, and caught in a short time trout enough for supper and breakfast. We made a bark canoe and cut wood for our fire, and were ready to lie down at 9 o'clock. The next day we spent in making us a spruce bark canoe, as we were below all rough water until we got below the lake, and early the next morning we tried our new boat and found it all O. K., and at 3 p. m. we ran out in the Megantic Lake. Then we paddled along and more leisurely, as we knew we had plenty of time to go to the outlet to the new hotel just opened. It was built by Bruce, and is now run by him, and a more sociable and hospitable man cannot be found. This house is large and commodious, and is situated in the right spot for sportsmen. Trout-fishing is good in and around Megantic Lake, and bass are caught in large numbers.

At 7 a. m. we passed a very pleasant night with Bruce, and at 7 a. m. the following morning we bade him good-bye, and once more took up the paddle, and, pointing our bow north, shot out of the lake and down the rapids of the Chaudiere River. After running our canoe for about three miles, we came around a sharp turn in the river, and near the bank on the west side, just in some rushes, stood a fine buck. Fred laid down his paddle and took up his rifle; but as he did so he buckled up, for he had noticed the noise we had made; but it was his last look, for he caught the ball from Fred's rifle between his eyes, and with one bound forward he fell into the river. The current was strong and took him down, but we soon came alongside, and, towing him ashore to where we could load him into our boat, we went again down the river at a fearful rate, as the current was strong and in many places almost falls, but we did not care as long as our canoe did not leak. At noon we stopped, cooked some of our venison and ate our dinner. Then on we went again, and about 5 o'clock we saw another deer, but did not kill it, and laughed as we saw it bound away when it saw us. Our ride all day was through an unbroken wilderness and on a stream that runs very rapidly; so much so a man must keep a sharp lookout or he will see a rock coming through the bottom of his canoe. Just at dark we reached a clearing of about ten acres, and near the centre stood a log cabin. We landed, drew our canoe up the bank and went to the cabin, where we found two people—a man and woman—both young and not over twenty-two years, I should say. They were French, and it was some time before we could make them understand what we wanted,

and the only way we could tell them that we wanted to stay all night was by throwing ourselves at full length on a bed that stood in the corner of the shanty; then they smiled and bowed their heads, and we made ourselves at home. We brought our deer from the canoe to the cabin and gave the whole to the Frenchman, who seemed much pleased. The wife soon had some of the steak on the coals, and soon after we were feasting on trout, venison and Indian wheat cakes, baked in the coals. The cakes were delicious. When it came time to go to bed, we asked the man where we should sleep, and at last made us understand that he had no bed for us, and that we would have to sleep on the floor. So we asked him where on the floor we should lie, thinking he must have some blankets in the chamber for us, but he pointed to the corner of the room, and said "Anywhere;" and with our coats for pillows we put in the night as best we could. Very early in the morning we ate another meal of venison and Indian wheat bread, then bade good-bye to our French friends, and shoved a bark canoe more into the current. We had gone about a mile when we came to a birch bark canoe propelled by an Indian woman. We stopped our craft, and after a quiet talk with her. She asked us to go to the wigwam with her. We accepted the invitation, and when we reached the dwelling we found an Indian stretched at full length on some boughs in front of a small fire, smoking a long-stemmed pipe. The man seemed contented and happy, and merely recognized us as "the 1's" and rolled over—the influence of fire-water, probably. He did not seem to talk, so we passed on, and looked the establishment over, then took our departure once more in our canoe. We swept down the current of the roaring river, and stopped only to cook and eat our dinner until nearly dark. We did not see a house all day, nor could we see any signs of civilization. When we landed to prepare for a night in the woods, we made a shelter with a rubber blanket, and with a good fire at our feet we rested well. At daylight we were astir, and, after eating our breakfast, we started. Our canoe seemed to leap through the water, as we forced it along, helped by the current. The river showed more signs of rough water, but little did we care as long as the channel was deep enough to float our canoe. Everything went well for three hours, and we came to Big Falls. We did not know what we had to contend with until it was too late; until our bark was in the strong water, and too late to back out. Fred was in the bow, and I heard him say, "Oh! my God," and the next instant he cried, "To the left of the centre rock," then "To the right, hard," and by the time he was done talking the canoe passed over the first fall, and seemed to stay in the air for an instant, as if in trouble, and seemed to stop good-bye to the things of this world. Then it struck the leading waters below, and, as we ahead of our saddles, for we saw at a glance if the undertow caught the stem of our boat we were lost; and never did two men pull with more resolution than we did in that perilous time. The bark stood still for an instant, then, with a tremble, started to make another and her last leap. With all the power we could muster we drove the canoe ahead, and tried to swing it to the right. We turned it a little, but not enough. It made the leap, and almost cleared the rock, but struck hard enough to burst a hole in the bow nearly as large as a man's hat. Fred saw the break, and with one stroke of his paddle shoved the canoe off the rock, then played the part of Perry, by plunging up the hole with his own coat, while I ran the wrecked craft into the eddy and to the nearest shore. We sprang out, and never did men shake hands more earnestly than we. Then, to look back over what we had passed, and to think what kind of a boat we too late in, made us feel as though something besides human power had saved us from a watery grave.

"It took us two hours to repair the damage done to our canoe. Then we started again; but not to run blindly into more danger. We found no more of such rough water, and at 2 p. m. we came in sight of houses, when we bade good-bye to our bark, and with a good team, driven by a Frenchman, we rode to St. Joseph, a distance of thirty miles further down the river, through the best farming district I ever saw in either Canada or the States. It was just the time of day to make a ride pleasant, and we enjoyed the scenes we witnessed exceedingly. We stopped over night at the St. Joseph Hotel, and at 6 a. m. the next morning we took the train for Point Levi, arriving there at 9. Took the ferry for Quebec, where we hired a carriage, and also a guide, and visited all the important places. It would, doubtless, be of little interest to you, but it was a feast for your eyes. At 5 p. m. we left the city, and enjoyed the ride to Montreal on board of the fine steamer *Quebec*, arriving there at 6 a. m. the following morning, when we took another guide, and looked the city through. We stopped at the Windsor House. At 7 a. m. the next morning took the train for Scottstown, where we stayed for the night. At 7 a. m. we left by team for Pemberton, and on our way to the best farming district I ever saw there are busy at work, and also where you can find a perfect gentleman, who superintends the business. He showed us all through the mine, and also the gold he had on hand. Soon after leaving the mine we left our team, it having taken us to the end of the road. We put on our packs and struck into the woods. We skirted the west shore of Connecticut Lake—headwaters of the Connecticut River in New Hampshire—and just at dark walked out on the shore of the Second Lake. We fired our rifles, and were answered by seeing a boat making for us. It came up. We got in and were landed at Tom Chester's camp, a place owned by him, and

Natural History.

BROOKLYN "FORESTER CLUB."—An association of young gentlemen has been formed in Brooklyn something similar in aims to the National Ornithological Club. Any of the Brooklyn readers of the FOREST AND STREAM who may have similar tastes and would like to join the new "Forester Club" are invited by the President, Mr. W. W. Walsh, to send in their names to the Secretary, Mr. Robert Sabin, No. 3 Westfield street, Brooklyn. We bespeak for the Foresters all the pleasures of the fields and woodlands.

FURTHER NOTES ON BELOSTOMA.—Our correspondent, Mr. D. M. Yost, of Norristown, Pa., kindly keeps us au courant as to the habits of the curious water bug now in the aquarium of Mr. J. S. Baker of that place. In his last note he says:

A few days ago it attacked a water turtle measuring 24 in. across by 24 in. long, and weighing 14 ounces, and would certainly have killed it but for the sharp edges of a fine wire screen lying on some stones on a level with the water in the aquarium, against which the turtle succeeded in brushing off its foe.

This unsuccessful attempt seemed to infuriate the beast, and he immediately turned on a couple of tadpoles of large size and killed them in succession in a few minutes. He did not feed on them, however, but seemed to kill only for the sake of killing. In his attack on this turtle he attempted to pierce the points of the armor, and evidently succeeded so well as to make it frantic with pain, as it rushed about in perfect frenzy, snapping at its enemy and trying by every means to dislodge it. Since this attack the turtle shows evident signs of fear on the approach of the beast, while another of the same size, placed in the aquarium since, takes no notice of it. We are looking for another snake to put into the aquarium, and will give you the result if interesting. The fellow is getting to be a sort of elephant among the water bugs, and is depopulating the aquarium so that Mr. Baker is getting rather tired of him. Strange to say he has never attempted to interfere with the fish, although there are a number of various species in the aquarium.

ANOTHER BOAT FLY.—Scranton, Pa., July 31.—Mr. Editor: In your issue of July 25, 1878, a correspondent writes about and describes a strange water insect. I received your paper July 26 about 4 p. m. Some three hours previous while walking near some old holes in which water falls and becomes stagnant, containing a growth of aquatic grass, I stopped to look at just such another insect lying on the surface of the water, and which resembled a prod of my cane, as I tried to turn it over, by a vigorous attack several times repeated. As soon as the article in question had been read the similarity between the two was at once recognized and noted. H. C. C.

THE HAYDEN EXPEDITION.—Under date of August 3 the Interior Department has received a communication from Professor F. V. Hayden from Big Sandy Creek, west base of Wind River Mountains, Teton district, Wyo. One party, under Mr. Garnett, started northward of the valley of the Green River for the Yellowstone fork, and the other, under Mr. Clark, for the Teton district. Professor Hayden writes: "We have been eminently successful so far in every undertaking, and have secured much valuable information. We have no trouble from Indians. Some of the Hannocks are now camped, fishing and hunting, within a few miles of us, but most of them have just returned to their reservation near Fort Hall. They are understood to be perfectly peaceable. It is not probable that there will be another opportunity to communicate with the department before some time in September, when we reach Mammoth Hot Springs, in the National Park."

GUNTHER'S MIDGE.—Editor Forest and Stream: We have to announce another addition to our fish fauna, a little fish which resembles the mackerel midge rather closely; a member of the cod family now recorded, I believe, for the first time. It is described by Gunther in his Catalogue of Fishes in the British Museum, vol. ii, p. 386, and vol. iii, p. 362, under the name of *Hypsiprora argentea*. In the absence of a better name I propose to call it Gunther's Midge. This midge may be distinguished from the mackerel midge, *Ciliata argentea*, very readily by its entire first dorsal of six rays, instead of the more numerous isolated filaments which compose the first dorsal of *Ciliata*. The ventrals of Gunther's Midge are three-rayed and in the dorsal of *Ciliata*, "about like an oar." The collector is Captain R. H. Hurlbert, of Gloucester, our worthy pilot. The locality was off Cape May.

Gloucester, August 13.

TARLETON II. BEAN.

ANOTHER ALBINO CHICKEN.—Warrenton, Va., June 20, 1878.—Editor Forest and Stream: "Mac's" letter, in your issue of 18th inst., recalled the fact that there was an albino in this vicinity, an account of which was published in the Southern Planter last year. This morning I made a visit to this albino, and upon investigation find the following to be the facts of the case. Mr. R. C. Newby (conducting a tannery near this place) in 1876 procured a full-blooded black Spanish cock to run with a lot of hens of the common breed. One of these hens (brown color) laid out, set and hatched six chicks, all taking after the cock in color—a jet black. One of these chicks, a young cock, was "turned out" and at maturity showed all the points of the black Spanish, except that two of the longest tail feathers were white. When this cock mated in 1877 he became pure white, and so remains to this time, eyes pink. Mr. N. kindly offers this bird to "science" if "Mac's" suggestion is adopted. There is no question as to the facts contained in the above statement. The change in color went on under the eye of Mr. N. and his "foreman," both of whom will make affidavit thereto.

R. H. DOWNMAN.

QUAIL UNDER A HEN.—Editor Forest and Stream: A circumstance occurred here last spring which was very amusing, and I thought I would share it with you. I was hunting a quail (*Ortyx virginiana*) and was very much interested in the matter. About the first of May last Mr. John Woodford (a thorough sportsman), of this county, found a nest of partridge eggs, some sixteen in number. The thought occurred to him to place the eggs under a hen, which he accordingly did. Having at the time a small game hen which had stolen her nest, he found her and substituted the partridge's

eggs for her own. In due time the majority hatched out, ten in number, and a prouder hen than this one seldom led forth her charge. They seemed as droll as all the broods of chickens, and would come at the mother's every call. They showed but few signs of that excessive shyness that all wild birds manifest when you approach them, but they would come and eat crumbs as they fell from Mr. Woodford's hand. Every night the hen would gather them in her nest and carefully cover them, but at last a very severe rain, long continued, submerged the place where they nested, and every one was drowned, much to our disappointment. They lived long enough to demonstrate the fact that the wild nature of the quail can be much modified by domestic hatching and mother. The prospect for sport in this county was never better. Some broods of quail have hatched, and fly strong already; they even come within the town limits and cheer us with their well-known cry, "Jeb Whizz!" Our quail were waders here dealt liberally with us, having stacked all our important streams. Several of our citizens, having fine artificial ponds, are anxious to get some of Prof. Baird's carp to stock them with. We are organizing a fishing and hunting club; will give name and data after full organization.

Montgomery Co., Ky.

VAN.

A TOWN YOUNG NIGHT HAWK.—U. S. *Barge Kinsheloe, Colorado, July 20, 1878.*—Mr. Editor: While engaged upon the survey of the Columbia River, in the vicinity of St. Helen, a short time since, I observed some facts which will probably be of interest to your Natural History readers. I was looking for a site to erect a signal upon, and selected a point upon a remarkable basaltic cliff, and in close proximity I discovered the nest of a night hawk containing two eggs. I have said a nest, but there was no semblance of a nest, as the eggs were laid upon the bare rock, in the vicinity, was desolitude of grass or shrubs, and covered with a coat of moss. The parent bird was prevented from covering her eggs for three or four hours by the presence of my party at work, and, wishing the eggs for my collection, I proceeded to prick a hole with a pin in each end of one egg, which I found would not empty of its contents by blowing, for the hole was so small that the pressure of the air had not advanced. I did not puncture the other egg, and placed both back in the nest. Twelve days afterward I had occasion to visit the same station, when what was my astonishment to find not one, but two healthy young birds occupying the nest! I will add that in my efforts to empty the egg of its contents, I will only thrust in the pin as far as it would go, but stirred the contents inside, and only obtained a little blood and a drop or two of serous fluid. That this procedure had not been followed after such treatment excited my unqualified surprise, but the facts can be vouched for by five or six members of my party, and as facts I present them to your readers.

CLEVELAND ROCKWELL,
Assistant U. S. Coast Survey.

SOCIALISM IN SOUTH AFRICA.—Under this title Mr. F. E. Colenso, writing from Maritzburg, Natal, contributes to *Nature* an account of some observations of the habits of certain ants, which are very curious. Writing under date of May 12, he says:

I noticed this morning that along the bottom of the front wall of my house, on the veranda, there lay a quantity of reddish-brown powder; there was enough to fill a coffee cup. On looking closer I saw that it was made up of small and larger fragments which glistened, and on inspecting some in my hand I found them to be the heads, legs, trunk, etc., of countless ants. A number of these animals were still on the wall above, and my attention being now arrested, I watched them and saw that they were contributing to the carnage beneath. This species of ant is a small, comparatively harmless one, the chief sin of which is that it makes its way to every species of food and swarms on it. As is usual with ants, the general body of insects is accompanied by larger individuals, which are provided with heads and jaws quite disproportionate to their bodies, and with these jaws they do all the cutting up. Among the ants on the wall there was a large sprinkling of the "soldier ants," and the whole community seemed bent on destroying them. The proportion of heavy-jawed to ordinary ants was about one to ten. I saw a group of little ones fastening on to a big one, which made desperate efforts to resist. As first the big one bit several little ones in the head, and the others dropped down from the wall; but after a while the little ones severed all the legs of the big one and finally got on his back and cut him in two. The group then dropped down to swell the mass below. Similar scenes were enacted elsewhere on the wall. The commencement of one combat was as follows: A big ant walked along until he met another big one, and the two shook antennae. Just then a little one seized hold of a leg of one of these big ones. The big one took any notice, but continued a rapid conversation. Suddenly other small ones came up, when the big one whose leg was grabbed turned furiously on the little one and seized him by the middle. This could not be done until the big one had doubled himself up. As soon as he had held of his small antagonist he lifted him in the air and snipped him in two. Meanwhile all the big one's legs had been seized by little ones and the party seemed to turn over and over, until the big one tumbled down, now a leg, now half an ant, till the big one was vanquished.

The ant is most assuredly subject to passions. The way in which the big ant turned on the little one was singularly indicative of rage. The determined manner in which he laid hold of the little one was quite human.

For Forest and Stream and Rod and Gun. THE AMERICAN ELK (*Cervus Canadensis*).

By WM. H. REED.

THERE is no nobler game in all the Rocky Mountain region, and none more attractive either to the amateur or professional huntsman, than the American elk or wapiti. Their range is yearly growing more and more restricted, and I have no doubt that they will be among the first to entirely succumb before the advance of civilization. Their present eastern range in the Rocky Mountains is almost wholly restricted to the foot-hills, except in the northern part, where they extend somewhat into Dakota. In Kansas, not long ago, they were known to extend nearly to the interior of that State; but I believe not an instance has been known of their capture for three or four years, and then in the extreme northwest. In Nebraska they are yet rarely seen in the southwest. In the south they extend at least as far as southern Colorado. At

nely fitted up, where he entertains sportsmen, and where they can find plenty of fish and game. We remained with Tom over-night, and at 5 A. M. we started for Parmachenee, arriving there at noon, and at Camp Caribou I bade good-bye to Fred, and he started for camp Kennebec, Indian Rock, and the steamer *Ogishco*. Thus passed a fortnight through a new country. We think it a route to be thought of by you, and also by parties wishing to take a long trip through a wilderness where game and fish are so abundant.

The pursuit of the deer of Barker and Danforth must have convinced any reader that two braver or more experienced guides do not exist. They can be addressed by letter to Camp Kennebec, Indian Rock, P. O., Franklin Co., Maine.

Stanley, N. J., Aug. 12.

GEO. SHEPARD PAGES.

Fish Culture.

FISH CULTURE IN WISCONSIN.—A letter from Mr. Hallock, of this paper, says:

"While in Madison the other day I called upon Fish Commissioner Welch and also had the pleasure of visiting the State hatching house, now under the charge of Superintendent Welch and Assistant A. B. Scott. Mr. Sanger, of Brooklyn, and two sons of Hon. Wm. Allen Butler, of New York, accompanied me. The State and those interested in fish culture ought to congratulate themselves for the amount of work accomplished in so short a time by the gentlemen in charge, this being the second year of the establishment. The hatching house is capable of turning out several hundred thousand fry each year. There are now in the ponds some 300 Eastern salmon, two years old, in fine condition; 2,000 California salmon (*quinnat*) three years old; 6,000 Mackinaw yearling trout; 2,000 brook trout spawners and 7,000 yearlings, and a few landlocked salmon, all in fine order and all hatched in the hatching house. There are nice large springs of pure cold water on the premises. The grounds are spacious and diversified in surface. They are much resorted to by picnic parties as well as those interested in fish culture. The State appropriates about \$8,000 per year for the support of the hatching house. Superintendent Welch is much interested in promoting the coming exhibition of artificially raised fish to be held in Chicago next October. I may also mention, incidentally, that the salt hake has been found very efficacious in curing fungus among the fish."

WHAT ARE THEY?—"Piscator" writes from Montreal August 3:

A lively little visitor, came to us in shoals a few weeks ago and disappeared again. The visitor in question was a little silvery fish, very similar to a herring, but having its belly (as I found to my cost in taking it off my flies) serrated or edged with sharp spines. I presume it is the same fish which has appeared in such abundance in the upper St. Lawrence and Lake Ontario, and which both Gen. Green reported to have called a salt water herring.

Will you inform me of the proper name of that deep, silvery fish called here whitefish, shad water, or by the French *la queche*. It rises readily to the fly and dies hard, affording a good deal of sport.

In regard to these fish Dr. Tarleton H. Bean writes from the U. S. Fish Commission, Gloucester, Mass., August 17:

"Piscator" would confer a favor on Professor Baird by sending some specimens in alcohol of the herring-like fish which he took with a fly in the St. Lawrence. I am trying to find some gentleman who will take the trouble to send just that species from Montreal, because I think it is the alewife, *Pomolobus pseudoharengus*. We have the alewife from Lake Ontario and lakes of western New York, and to solve the problem of how they got there we now need specimens from Montreal or its vicinity.

The whitefish, shad water, or *la queche*, is a species of *Coregonus*, probably the *neogaeus* of Prescott, which is described in the "American Journal of Science and Arts," 1851, x, 340. This species is called shad water; it is found in Lake Winnipicosis. But it is almost impossible to identify fishes without seeing them. If your correspondent's fish be a *coregonus* he can readily observe that its dorsal fins are similar to those of a brook trout. Two specimens of *Alepisodus feroc* were received this morning from Captain Jerome McDonald, schooner *Geo. P. Whitman*, taken in lat. 49 deg. 43 min. N., lon. 63 deg. 55 min. W., at a depth of 300 fathoms, on a trawl line.

Will you not urge "Piscator" to send us specimens of the herring-like fish which he took with a fly? By the way, the alewife has been known to be so taken frequently.

ELKS, TADPOLES AND TURTLES.—Editor Forest and Stream: Your correspondent on elks, tadpoles and turtles seeks information on the eel question. This is as it should be, and his desire to acquire knowledge is laudable. At the same time he should not assume that all of us are blunderers because our eels will not condescend to "play." I follow my leader with his. The large eels in some streams do not descend to the sea in autumn for the purpose of hibernating. A few years since I lived at Derby on the Housatonic, at the head of tidewater, twelve miles from the Sound. I speared many eels in the winter, and found them as plentiful, lying dormant in the mud and spring-holes fourteen miles above the salt water as at the mouth of the river. These eels had their choice, and bedded for the winter where ever the bottom was suitable, regardless of salt. Their condition was adipose, and they continued to descend (into the mud) until they reached hard pan. I am grieved to learn my trout are in danger of being eaten by speckled mud turtles; but then the latter must first catch the former. That speckled turtles are carnivorous has been known to me ever since as a boy I saw them eat worms.

Troutbeck, Noyon, L. I., Aug. 16.

T. O.

MORE LIGHT FOR TADPOLES.—Editor Forest and Stream: I have just finished reading Mr. Roosevelt's humorous article on tadpoles in issue of August 15. The difficulty he has experienced in raising frogs calls to mind a college lecture on physiology, in which the professor, speaking of the effects of climatic changes, adduced in argument the fact that a tadpole kept in the dark would forever remain a tadpole, but when exposed to sunlight would in time develop into a frog. Now, without making light of this subject, perhaps this may account for the milk in the cocoon. The gentlemen may have stunted their tadpoles in the matter of sunshine.

New York, August 19.

present one of the most abundant ranges is near the head of the Snake and North Platte Rivers, where not infrequently they may be seen in herds of five hundred to even as high as five thousand. I have ridden for four hours through a continuous herd of these animals, and when they would hardly make room for my horse to pass through them. They were crossing at the time northward toward the Elk Mountain range in southern Wyoming. From April till the latter part of June they are constantly passing up to the higher regions, the cows, with their calves, keeping at snow line, and the bulls, while their horns are yet tender, or until the velvet has been worn off and their antlers hardened, keeping in small opened parks near the foot of the hills. At these times the cows are rarely together, while the males are usually in herds of five to twenty. At the first snows that remain on the mountains—in southern Wyoming about the middle of September—they pass down into the valleys and lowlands to remain during the winter. In timbered regions they pay away the sword to feed upon the nutritious buffalo grass; but after a rigorous winter they are usually very poor. In summer they are constantly harassed by the myriads of flies (*Tabanus rhombicus*, and more especially two species of *Chrysops*) and mosquitoes, that are found more abundantly near the snow line than elsewhere. During the breeding season, from about May 20 to June 30, the cows isolate themselves, invariably seeking timber where their calves—almost always twins—remain hidden till they are six weeks or two months old. Like antelope, the young are easily caught and tamed. When taken they run readily with domestic cattle, when the adult males will defeat the most powerful Texas bulls for the possession of the domestic cows. The cows leave their young in the latter part of August; at that time, for some unknown reason, they are most easily approached and destroyed. The rutting season continues through the latter part of September and early part of October, the cows apparently hiding from the males, while the latter, extremely restless, are constantly traveling about uttering their shrill, bugle-like note, that can be heard for a long distance. At these times the young males have a decided advantage over the older ones in obtaining possession of the cows. I once witnessed an amusing contest between a two-year-old and a powerful bull much older. For some time the heavy antlers of the older one were used with telling effect against the younger, and he succeeding in throwing him down several times. Finally, however, the younger one by his greater agility succeeded in attacking his opponent in the side, and, after several most vigorous thrusts with his sharp-pointed spike-horns in the flanks and the side of his belly, the older one fled, leaving the conqueror in peaceful possession of his hard-won mate.

Little or no reliance can be placed upon the number of prongs in the male's antlers for determining the age. In a full-grown animal the usual number is from six to eight, but in one instance I found as many as ten. The age up to the fourth or fifth year may be accurately determined by the size of the "ivories" or premaxillary teeth.

They are timid animals, with but little curiosity, and rarely show any pugnacity when brought to bay. The females are almost mute, seldom uttering any cry when wounded.

They find a powerful enemy in the mountain lions, and not a few, I believe, fall victims to them. Not long ago, while following a cow at a little distance, I was astonished upon emerging into a little park or opening of the trees to find her victim struggling with a lion that had evidently leaped upon her back from some overhanging branch. His terrible teeth were already fixed into the base of his victim's throat as he lay across her back, his claws firmly fixed in her shoulders and flanks. It could hardly have taken ten minutes from the first struggles before the cow lay quivering upon the ground, and the panther beside her dead from my rifle-ball.

LIST OF BIRDS IN PEOTONE AND VICINITY.

FOLLOWING is a list of the birds I have observed at this place and in the immediate neighborhood, with notes as to their abundance, breeding, etc. D. H. EATON.

Accipiter cooperi, Cooper's hawk.—Seen at Twelve-Mile Grove, about nine miles from here, on May 15, 1877; only one pair seen; set of eggs obtained; not very abundant.

Coryphæus erythrophthalmus, Black-bellied cuckoo.—Not very abundant; breeds. Two sets of two eggs each obtained on June 12, 1877. Nests built in apple trees in orchards.

Picus villosus, Hairy woodpecker.—Rare; seen often in winter. *Sphyrapicus varius*, Yellow-bellied woodpecker.—Rare; probably breeds in some of the groves near here.

Melanerpes formicivorus, Red-headed woodpecker.—Very abundant at Monroes and Twelve-Mile Grove; breeds; not seen during winter.

Geothlypis avarus, Yellow-shafted flicker.—Quite abundant; breeds. *Colaptes auratus*, King bird.—Not abundant; breeds.

Tyrannus carolinensis, King bird.—Very abundant; breeds; raises two broods a year in some seasons.

Turdus migratorius, Robin.—Very abundant; breeds; two broods a season.

Sialia sialis, Blue bird.—Abundant; breeds. *Regulus calendula*, Ruby-crowned wren.—Rare; seen only in spring; no record of its breeding.

Regulus satrapa, Golden-crowned wren.—Rare; seen only during spring migrations; does not breed.

Geothlypis trichas, Maryland yellow-throat.—Quite abundant; breeds; builds its nest among the weeds near the railroad, close to water; also in the reeds in large sloughs.

Scirurus auricapillus, Golden-crowned juncos.—Rare; seen only in spring, and know of no nest ever having been found.

Dendroica aestiva, Yellow warbler.—Abundant; breeds. *Dendroica discolor*, Prairie warbler.—Rare; breeds.

Pyrrhula rubra, Scarlet tanager.—Rare; probably breeds, as I have noticed in the summer.

Hirundo horreorum, Barn swallow.—Very abundant; breeds. *Hirundo lunifrons*, Cliff swallow.—Abundant; breeds.

Progne subis, Purple martin.—Abundant; breeds; rears two broods annually.

Colaptes auratus, Loggerhead shrike.—Common; breeds; rears two broods. Nests with eggs are found the latter part of April or first of May.

Colaptes excubitorides, White-rumped shrike.—Abundant; breeds; two broods each season.

Vireo gilvus, Warbling vireo.—Quite common; breeds.

Mimus carolinensis, Cat bird.—Common; breeds.

Harporhynchus rufus, Brown thrasher.—Very abundant; breeds.

Ostolus ypsilatrix, Short-billed marsh wren.—Quite abundant; breeds; builds its nest in the long reeds in large sloughs.

Chondestes trichas, Yellow bird.—Very plentiful; breeds.

Plectrophanes nivalis, Snow bunting.—Plenty in winter; does not breed.

P. lapponicus, Lapland Longspur.—Very plentiful in winter. Seen sometimes in flocks of 50 to 100 or more. Frequent corn-fields, patches of weeds and pastures, feeding on the reeds.

Chondestes grammacus, Ark thrush.—Common; breeds. Builds on ground in a corn-field at the foot of a hill of corn.

Zonotrichia albicollis, White-throated sparrow.—Seen only in spring; very plentiful then in the groves.

Synceila monticola, Tree sparrow.—Very abundant in winter; leaves early in spring.

S. pusilla, Field sparrow.—Common; breeds.

Empidonax americanus, Black-throated bluebird.—One of our most abundant birds. Arrives about May 1, and leaves the latter part of September. Builds in osage hedges, clumps of young grass, bushes and young evergreens. Raises two broods, the second set of eggs being laid in July.

Pipilo erythrophthalmus, Ground robin.—Common summer visitant; breeds.

Dendroica striaticeps, Bobolink.—Common; breeds.

Molothrus peccator, Cow bird.—Common; breeds.

Agelaius phoeniceus, Red-winged blackbird.—Very common; breeds; raises two broods. Have found nests with young, eggs nearly hatched, and fresh eggs in same slough.

Sturnella magna, Meadow lark.—Common; breeds.

Icterus spurius, Orchard oriole.—Quite common; breeds.

I. baltimore, Baltimore oriole.—Rare. Have seen but one nest in the grove at Wilton.

Quiscalus versicolor, Crow blackbird.—Common; breeds in large numbers.

Corvus americanus, Crow.—Common in the groves at Wilton and Monroes; breeds.

Cyanus erythraea, Blue Jay.—Quite common; breeds.

Euphonia migratoria, Wild pigeon.—Occasionally seen; does not breed.

Zenaidura macroura, Common dove, Turtle dove.—Very plenty; breeds; raises several broods each season.

Cupido cupido, Prairie hen, Pinnated grouse.—Plentiful; breeds.

Bonasa umbellus, Ruffed grouse.—Rare. One or two specimens have been shot at Wilton.

Ortyx virginianus, Quail.—Abundant; breeds.

Belaurus lentiginosus, Blitern, Thunder pump, Stake driver.—Common; breeds. Nest built sometimes in the midst of a slough, and at times on the ground at the edge. Usual number of eggs, four; have found one nest of seven eggs.

Charadrius virginicus, Golden plover.—Plenty during spring and fall migrations; does not breed.

Spizella socialis, Killdeer plover.—Very common; breeds.

Phalaropus minor, Woodcock.—Rare. Have seen but one bird, in a small grove of young maples. Do not know of its breeding.

Gallinago wilsoni, English snipe.—Plentiful in spring and fall; does not breed, except, perhaps, in isolated cases.

Macrorhamphus griseus, Red-breasted snipe.—Quite plentiful in spring; no record of its breeding.

Ringedovis macularius, Spotted sandpiper.—Plentiful. Have seen it during the summer, and it probably breeds.

Actitis hypoleucos, Field plover, Upland plover.—Common; breeds; nest built on the ground in pastures.

Perana carolina, Common rail.—Abundant; breeds.

Bernicla canadensis, Canada goose.—Generally common in spring; remains but a few days.

Bernicla brenta, Brant.—Occasionally shot in spring and fall on some of the large sloughs and lakes near here.

Anas boschas, Mallard.—Common in spring and fall. Some few pairs remain and breed.

Agia acuta, Spring-tail duck, Pin-tail duck, Pigeon-tail.—Not common; occasionally breeds.

Nelson carolinensis, Green-winged teal.—Common during migrations; may possibly breed, but have never found nest.

Querquedula discors, Blue-winged teal.—Common during migrations.

Polypterus podiceps, Carolina grebe.—Common; breeds.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR THE WEEK ENDING AUGUST 13: Two brown-throated parakeets, *Conurus erythrinus*, purchased; two crabs and one cucumber, *Oboletus confinis*, presented; three bald eagles, *Haliaeetus leucophthalmus*, presented.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SR., N. Y. HORTICULTURAL SOCIETY.

FLOWERS IN THE CITY.

DURING the last ten or fifteen years we have seen a vast improvement in the taste displayed in many points of our social and domestic life, but perhaps in none has more advance been displayed than in the floral decoration of our rooms, balconies, hotels and public places of resort. Formerly the attempt at decoration got no further than a few asthmatic scarlet Geraniums, red-spider Fuchsias, Heliotropes, with here and there an overgrown Oleander, Cape Jasmine, Cactus, or perhaps the beautiful (when well grown) scarlet Malvastrum. Now this dead level is broken through, and not only in the pretentious up-town hotels and the Fifth avenue mansions do we see the feathery and graceful Palm, the many-hued and resplendent Caladium and Coleus, etc., but among the poorer denizens of this crowded city the love of the beautiful is manifested in the care bestowed on the sweet Madeira Vine, the common Morning Glory, or any of those cheaper but not less beautiful flowering, variegated, or parti-colored foliaged plants that can be bought at such a low figure every season. For northern exposures, also, our native ferns are cherished as a boon by many, their graceful fresh green fronds being a relief to the eye weary of dusty streets and sun-baked brick walls, and their introduction has been helped by many, whose opportunities of enjoying the beauties of ferns in their native haunts are few and far between. Many of them are evergreen also, and it is surely more pleasant, when looking across the way or enjoying a quiet reading by the window, to look through a screen of ferns than through those abominations known as blinds, however useful they may be in their way. It is a common remark that flowers outside of a house are ostentatious, and from their arrangement sloping downward to the outer edge, they cannot be enjoyed by the inmates. Those who thus object, however, forget that they also enjoy the full result of their opposite neighbor's horticultural efforts, and are bound to make him some return. Besides, is it nothing to add to the pleasures—all too scanty—of the dusty and toll-worn wayfarers of the street? And that the lovely

flowers and rich green drapery, tended and trained by loving fingers in our windows and balconies afford pleasure, may be easily read in the admiring and loving glances directed toward them. Such a civilizing influence is by no means to be despised; it carries on in the hot dusty streets the good work begun in our well-cared for parks, and the glimpses of private gardens we sometimes see, and perchance reaches many a son or daughter of toil, in whose hard-working lives parks and gardens are words, and nothing more. The increased use of flowers and plants at balls, receptions, fairs and other entertainments, has also been most remarkable. Formerly, a few evergreens placed under the staircase, with perhaps a few flowering plants in front of them, was considered the *me plus ultra* of good taste. Now colors are blended with thought and care, graceful Palms and feathery Ferns break up monotonous lines; Roses, the queen of flowers, and drooping Fuchsias, many-hued Coleuses and Dahlias, and exotic-looking plants lend their aid to the general effect. On our dinner-tables, parlor-tables and mantels, too, floral decoration reigns triumphant; and why not? The first suggestion of such a thing is met by an outcry as to expenses, and certainly if nothing but the choicest Roses, Eucharis, Orchids or other choice exotics will content us, it is not without cause. But Iry, and common Ferns, Sheep Laurel, Lobelia, our native Lilies, yes, and Pond Lilies, too, sprays of Madeira Vine, Creeping Charley, Wandering Jew, Maurandia and other ordinary flowers are by no means costly, and these, arranged with taste by skillful hands, produce effects far superior to those attained by a less artistic disposition of the most expensive blossoms. A few sprays of Partridge Berry or wild Anemone, with a few wild Violets or other flowers among them, tastefully grouped in a small vase, will oftentimes give more real pleasure, especially in a sick room, than the richest and most elaborate bouquet, even if presented by CROUS NO. II. As long, however, as ladies will not take the trouble to arrange their flowers themselves, so long will the floral adornments of their tables and parlors be unsatisfactory. Flowers give the finishing touch of refinement to everything with which they are associated, but their arrangement requires taste, judgment, love and practice.

Mrs. W. J. D.

HOW TO FUMIGATE.—Some of our Southern and even Northern readers may want to know how a room, a kennel or clothing may be fumigated. Dr. Chandler, of the New York Board of Health, gives the following as the best method:

Place some sulphur in an iron vessel and pour a little alcohol on it. The alcohol will burn, and before it is burned away the sulphur will be ignited. There will arise from the burning sulphur sulphurous acid gas, which, like other gases, will mix itself with all the air in the house without the aid of draught or currents. It will penetrate to every crevice, and will destroy the vitality of every disease germ with which it comes in contact.

The Kennel.

THE ST. PAUL BENCH SHOW.—One of the novel attractions of the St. Paul Bench Show will be a full team of Esquimaux dogs harnessed to the sledge or *Trainau*. There will also be Hare Coursing and Fox Hunting. The field trial judges for the bench show are John Davidson, Esq., of Monroe, Michigan; O. J. Butler, Esq., of Stillwater, and Wm. Muliken, Esq., St. Cloud. In selecting the judges for the field trials the committee have had only one object in view, viz.: to secure the best practical and unbiased men. They have been peculiarly fortunate in doing this, as Mr. Butler and Mr. Muliken are well known in this State for their honorable and fair manner in dealing with all alike. Mr. Davidson is the recognized best judge of a dog on this continent. Mr. Lort, the great "all-round" English judge, paid him a very high compliment at New York in saying, that as many English judges as he had been associated with he had never met one possessing so much practical knowledge as Mr. Davidson. In securing Mr. Davidson as the bench and field trial judge the committee have done what no other club has been able to do, as his services have been frequently asked for, but always denied.

RICHMOND KENNEL CLUB.—A kennel club is now being formed in Richmond, Virginia. Mr. John Adams is one of its chief promoters. The Richmond sportsmen ought to attend the coming field trials in Minnesota.

DISTEMPER.—Mr. John Davidson, of Monroe, Michigan, who is to be one of the judges at the coming Bench Show in St. Paul, has recently lost twelve valuable dogs from distemper, and has taken the precaution to scatter his kennel to prevent the disease from spreading. He thinks the disease was introduced by one of his dogs which he took with him to the East last spring.

HIGH PRICE FOR A SETTER.—Dash II., but for the odd fifty guineas, might have come to New York, as our correspondent, Captain John M. Taylor, offered 250 guineas for Dash on the part of a gentleman in New York. *Belt's Life* of August 3 says:

Mr. G. Brewis has sold his celebrated field trial setter, Dash II., to Mr. Llewellyn for 800 guineas, the highest price ever paid for a single setter. It will be recollected that Mr. Brewis gave 180 guineas for Dash at Aldridge's, and since then he has won with him the Horsehead, the Kennel Club Challenge Cup, and a second and third also at Horsehead and Shrewsbury, added to which he won the Open Dog Stakes and the Champion Cup at Shrewsbury before Mr. Brewis bought him. Dash has been rightly considered the best looking setter that has ever contested a field trial, and as he is nearly a pure Laverack, combining the two best strains of that sort, old Blue Dash and Blue Prince, he must necessarily be a most invaluable dog at the stud. He was bred by John Armstrong, and was got by the late Mr. Laverack's Blue Prince out of Kate, by Mr. Laverack's Old Dash out of Kate, by Mr. Field's Duke, and he is now five years old.

NAMES CLAIMED.—*New York, Aug. 14.*—Mr. C. H. Clayton claims the name of "Flame" for his red setter pup, out of Killarney (imported Frisk and Grouse by imported Milo—Dan-Venus), whelped May 16, 1878. "Judge" for his orange and white setter pup out of Fan (Gildersleeve's Dash-Fan),

S. S. *Ibis* and *Ideal* and schooner *Tarantula* made port during the afternoon. The double huller *Nereid* did better than we had expected, but then it was a free wind all the way. If she had had much turning to do in the seaway her speed would hardly have been so favorable. *Volante* made a fine run when the difference in tonnage between this cutter and the big ones is considered.

The Atlantic Y. C. disbanded this day in Newport Harbor. A noteworthy run to Newport was made by the little *Alma*, of the A. Y. C., and the heavier wind of Aug. 9. She made a record, considering the tacking about though in the ugly sea near Point Judith. Such a run is spent ashore by most amateurs and the fleet lay quietly at anchor for the day.

(To be Continued.)

The captains assembled aboard of the *Restless* late in the evening and received their sailing orders for the next day. The first port was to be Shelter Island, Gardiners Bay, thence to New London, Newport; remain over Sunday, and on

to carried all day and *Regina* had to rough the way with the *tine*, *Vizen*, *Clito*, *Estelle*, *Madelaine*, *Cornwall* (who had joined the fleet), *Rambler*, *Vision*, *Realstar*, *Poam*, *Restoration* (all added to the squadron), *Dreadnaught*, *Intercept* and *Nereid* following through in the order named. The *Clito*, she almost always followed the *Regina*. Flashed in the *Clito* she showed again to advantage, for *Rambler* went by *Madelaine*, *Estelle* and *Clito*, and took the lead among the schooners, with *Dreadnaught* and *Intercept* off her weather quarter. At six bells, the *Vice's* schooner had actually got the best of all the sloops into the bargain, and was pointing the course to New Bedford. The *Clito* was the first to see the *Clito* and the *Clito* was her rival, *Clity*, had remained at anchor in Greenpoint harbor, and so there was only *Clito* to bother her. Just

OWS.	Name.	U. M. \$.	Name.	U. M. \$.

sparsely participated on board of such frigates, for fear of putting them out of trim after a hearty meal; but they form an excellent school for learning how to handle a boat, and time spent in them is not by any means thrown away. The race was very successful in all respects, and the committee of the New Rochelle Y. C. is to be congratulated upon the issue of this the fifth regular annual regatta they have held. *Huile S.*

For home after landing the purse of \$150 for her crew. The first prize was won by the "Hawkeye" from among the other yachts present, those flying the pennants of the Atlantic and Jersey City Yacht Clubs were prominent, while the Seawanhakas were likewise represented as a matter of course. The final of the race we give below :

Wesphalia.....	1 04 45	4 66 15	3 55 30	8 52 30

The owner of *Dare Devil* has challenged *Susie S.* to a match for \$100 a side, working canvas only, ten miles to windward and back.

SAN FRANCISCO YACHT CLUB.—The annual regatta of this club was successfully accomplished Saturday, Aug. 3, in a fresh breeze and sea. There was a strong muster of yachts, and, considering the recent formation of the club anew, it certainly exhibits signs of a vigorous growth, and must be congratulated upon the energy and interest manifested by all its members. The list of yachts was unusually long, and indebted to the efforts of the Commodore for the high standing now attained in the list of American yacht clubs, and that it is a wide-awake concern, up to the latest doings in the sport is evident from the fact that the honor of first having introduced the wonderfully handy yawl-rig, belongs to Capt. C. H. Harrison, of the *Proie*, and Capt. T. A. Hyde, of the *Puget*, both flying the colors of the S. F. & C. Eastern yachtsmen's association. The regatta was a very successful one for the State. We reserve some further comments in connection with this regatta and model on the Pacific for a later issue. Entries for the match, with a summary of time, made as follows:

Name.	H. M. S.	Home.	T. T. Time.	Do. with Al.
1. Consuelo.....	1 19 45	x. 61 45	3 32 9	73 29 2

Courses from Long Bridge to Hunter's Point, to and around beacon off Oak and Harbor, thence to and around stake-boat off Fort Point Wharf and return over same course. Second-class and cat-boats returned directly home from Fort Point Wharf stake-boat.

THE CUTTER MURIEL.—Many are the tales of the wonderful doings of this pretty little crack that come to us from all sources. Though we prefer to await authentic accounts of her sailing, we may say that all agree in praising her wonderful handiness, while not a few are even sanguine as to her speed. Built and sparred for a cruiser only, speed *per se* has not been the aim of her designer, but if fast, it will certainly be just that much more to his credit.

NORWALK YACETSMEN AFLOAT.—The members of the Columbia Y. C., of South Norwalk, Conn., Commodore Herbert H. Booth, will leave that place on a cruise up the Hudson. They sail in the sloop *W. B. Smith*, in charge of Captain Thomas Wright, and expect to be gone a week.

CRUISE OF THE S. S. VEDETTE.—Mr. Phillips Phoenix, of New York, is now on a cruise in his new steam yacht *Vedette*, 93 tons, N. M. He arrived at St. John, N.B., on the 15th inst., all well. After remaining a few days she proceeded across the bay. Captain A. Williams has charge of her.

NEW BEDFORD YACHT CLUB.—The fourth cat-boat race of a series, for the New Bedford Yacht Club's Cup, was sailed Aug. 10 over a six-mile course. Won by *Sylph*, J. H. Beetle, Esq., in 1h. 13m. 5s., beating *Turk*, *Alice*, *Entice*, *Cito* and *Pester*. Previous races won by *Entice*, *Cito* and *Sylph*.

A GOOD RECORD.—The *Fancy*, Mr. P. Grant, Jr., has a fine record, and has established herself as one of the fastest among the small craft in and about Boston. She is cat-rigged, 22ft. long, 9ft. 6in. beam, and was built last spring by Pierce Brothers, of Boston, in 1877. She has started ten times, winning first prize six times and second prize once. The first three races were lost on account of being under sparrd the first season out. She flies the Nahasset pennant.

BEVERLY YACHT CLUB.—As announced in our columns, the regatta held by this club off Cotuitport was sailed Aug. 17, a strong wind blowing from the southeast. The judges were: Messrs. A. L. Lowell, J. T. Coolidge and G. P. Gardner. The race finished as below:

FIRST CLASS,		Actual Time.	Corrected Time.
Name,	Owner,	H. M. S.	H. M. S.
Wauquilt.....	A T Perkins.....	1 24 43	1 16 37
Elise.....	J T Coolidge, 3d.....	1 34 17	1 21 21

Garibaldi.....	A Colman.....	1 47 15	1 20 30
Louis.....	J T Coolidge.....	1 53 35	1 30 01
Peer.....	E J Lowell.....		

UNION REGATTA OFF STRAWBERRY HILL, BOSTON.—An open regatta will be held Aug. 31, off Strawberry Hill, Boston harbor. Yachts will be divided into three classes, separate prizes for keels and centreboards. Course will be designated at a later day. Judges: Com. M. J. Kiley, S. S. Goodwin, Geo. C. Melvin, H. A. Keith, Geo. W. Morton and Geo. H. Palmer.

PROVIDENCE YACHT CLUB.—The midsummer regatta of this club was held Aug. 13, over a course in Narragansett Bay, off the city. Wind, a wholesome breeze from the S., and the sea smooth, with a fine sail all around. Course from the Point to and around the city, back to the Point, back to the Point, then down to Bullock Point, light and return to the stakeboat. Distance ten miles. Two pennants for prizes. The yachts got away together, save *Hildgards*, who soon gave the others the lead and made for Bristol. *Hope* and *Lizzie* on the run up carried away their gaffs and withdrew. *Starlight* and *Lottie* had the race to themselves in their class after this, and *Warwick* was alone in the second. The match finished as under:

NAMES.	FIRST CLASS.			
	Start.	Return.	Actual Time.	Corrected Time.
	H. M. S.	H. M. S.	H. M. S.	H. M. S.
Starlight.....	1 25 80	2 59 00	1 53 30	0 59 25
Little.....	3 30 30	5 45 45	1 47 15	1 12 02
Hope.....	1 25 15	withdrawn.		
Hildegard.....	3 30 00	withdrawn.		

The race for small local craft was won by *Myra*.

OAR AND PADDLE

THE SILVER KE REGATTA.—The great regatta of August 15, held on Silver Lake, near Boston, has come in many respects to unlooked-for terminations. The defeat of Courtney by a colored carpsman of rapidly-rising fame carries with it the loss of the regatta to Courtney a good turn in time. In the first place it has proved the weakness of Courtney's generous to despise one's enemies, and secondly that it will not do to come to the start in an untrained or unfit condition. It was expected that Riley would have made a better showing than he did, but as he avers that he slowed down to watch and stand by Courtney in his illness, this may account for his lagging behind, to the disappointment of many of his friends. Courtney's defeat by a colored carpsman, however, is one thing can be said, that with a better training and a finer style he will soon be a man to be feared by any who may fall over the same course with him in the future. Wallace, Ross and Hosmer failed to put in an appearance, and Plaisted and Morris were also absent. This robbed Frenchy's victory of much of its significance, upon the supposition that Riley did not do his best. It is being conceded on all sides that Courtney is a very good carpsman, and that he is Boston's best man, and one who can make away with anybody but a very best. Moreover, the manly and generous conduct of this colored knight of the oar has won for him many friends. He is ready to acknowledge that his defeat of Courtney was owing to the latter's illness, and does not expect to perform the feat again. In time, however, Johnson will make his mark. He has the physique and will, and only lacks more perfect training to get the best of his muscles and into his boat. The day's proceedings of the regatta were a splendid show.

urred, though the surface of the lake beneath was smooth and in good racing order. Owing to the exertions of Captain Flynn everything was in readiness at the appointed time, and the amateur single scullers were called a little before 2 p. m. Entries and positions: No. 1, J. Francis; No. 2, F. F. Butler; No. 3, W. H. Backman; No. 4, T. O. Murphy; No. 5, M. Crowley; No. 6, J. James; No. 7, J. J. Houghton, and No. 8, J. J. Houghton. The start was made by James Larmon, Phillips and Lee did not start. At the word "Go" Murphy, Houghton and Butler got away together, with Holmes following. At the half-mile Regan spurred and went into second place, and Holmes, with a long, steady swing, took the lead. At the mile he lead by four lengths, Regan still second; but at the turn Houghton displaced him and spurred after Holmes, but to no avail. Holmes won by two lengths in 21m. 57s.; Houghton second, 22m. 3s., and Murphy third, 23m. 57s. The following table shows the time of each sculler as recorded. The following took the lead at successive points:

second and City Points behind, having made a bad start, Shawmuts steered poorly. At the mile the Rhode Islanders got the lead, and from the turn had the race in hand, Shawmuts keeping second place. The Rhode Island crew crossed in good style in 18m. 42s., Shawmuts 19m. 11½s. and City Points 15m. 50s. The Rhode Islanders were the cause of the delay, and they had been even more interested in the presence of many who had entered rendered the list of competitors very meagre. Courtney was, of course, the favorite, and bet against him could hardly be obtained. The rumor of his illness, however, soon spread among the crowd. Ellis Ward left off, but Frenchy's muscle began to tell, and sent him ahead. Riley and Courtney kept together, and Sullivan brought up the rear. Courtney was 300 yds. ahead of Riley, 47½ feet, neither of them gallant, on the Bostonian. Johnson noticing an attempt of Riley to drive him out of his course, spurred and gained his stake some five lengths ahead. At this juncture Courtney felt the first symptoms of his coming illness, and told Riley to go ahead. Both turned, Ward next and Sullivan last. At the last mile Courtney threw up his hands and the judge's boat went to his rescue. The race was over in 34m. 45s. Courtney 21m. 11½s., Riley, 22m. 46s., Ward, 23m. 44½s. Courtney, who had pulled on once again after having his head bathed, finished in 24m. 49s. The next race was four-oared working boats. Entries: The Lakeman No. 1, the Ward-Butler and the Chelsea crews. Lakeman led all the way from the start and crossed ten lengths ahead in 19m. 30½s.; Ward-Butler, 19m. 38s.; Chelsea, 19m. 46s. Johnson rendered an excellent reception and was well considered by the friends, who went so far as to propose a race with Hlanlan. This, though, is going a little too fast, for Johnson is not yet equal to the Canadian by a long piece. Courtney's reception by the Bostonians was very warm. The weights and boats of the professional scullers were as follows:

Charles E. Courtney, of Union Springs, N. Y.—Weight, 171 pounds; height, 5ft. 1/2 in. Boat, built by Waters of Troy, paper, 25ft. 10 in. beam, and weight, 85 pounds.

James B. Riley, Saratoga Springs, N. Y.—Weight, 161 pounds; height, 5ft. 1 1/2 in. Boat of paper, built by Waters, 25ft. 10 in. 1 1/2 in. beam, and weight, 85 pounds.

John W. Johnson, of Batston—Weight, 155 pounds; height, 5ft. 10 in. Boat of paper, built by Waters, 25ft. 10 in. 1 1/2 in. beam, and weighing 81 pounds.

John Ward, of Zanesdale—Weight, 153 pounds; height, 5ft. 11 in. Boat 25ft. 10 in. 1 1/2 in. beam, and weighing 83 pounds.

J. P. Sullivan, of Lowell—Weight, 141 pounds; height, 5ft. 10 1/2 in. Boat 25ft. 10 in. 1 1/2 in. beam, and weighing 29 pounds.

Johnson made the best time ever made at Silver Lake, beating Hahn's time by 19 1/2 seconds. Courtney expresses his willingness to row Hahn's crew, the Silver Lake crew, which, he says, pleases him much. Riley left the same day for Hamilton, Ont., where he was to row on the 21st inst.

WHY SHOULD THEY MEET?—A race between the Shoe-vacuumers, Atlantas and Columbias would no doubt be very interesting, though in common with the Western crews we fail to see by what right either of the New York crews can expect the Monroe men to travel 1,400 miles just to perform a performance which every prejudiced critic will allow them quite capable of doing. The Shoe vacuumers, the Columbias at Henley, and we may say with ease as well, for they never even spurted for any length of time and had plenty of steam to spare at the finish, while the Atlantas got all they wanted at Watkins. If the New York crews are really desirous of meeting the Western men, nothing will be more readily arranged. Let them take their boats out to Michigan, and, as we are informed, the Shoes will give them a race whenever they want one. The latter have by this time got their new boat, we believe, and it is reasonable to suppose that equivalent to a lead of an additional length or two, for they were badly handicapped with their old dug-out. A gentleman connected with the Detroit River Navy states that if the Shoes desire to go to Henley next year the financial means will be forthcoming.

CANOEIST ON HIS TRAVELS.—Mr. W. L. Alden, of the New York Times, well known as a canoeist and author of "The Canoe and Flying Iron," and other similar books, has boarded his canoe for a time and has sailed for a cruise abroad in Europe. As a member of the Rob Roy Canoe Club of England he will send us accounts of the sport as it is in England to-day, which, it is needless to say, will prove most interesting and valuable to the devotees of the paddle in this country.

THE SHADOW CANOE IN MASSACHUSETTS.—Mr. William Blakey, the well-known shell boat builder of Cambridge, Mass. has in hand a shadow canoe for a member of the Harvard Club.

ST. LOUIS PROSPECTS.—The heat during the summer has somewhat interfered with active operations in St. Louis boating circles, but for all that the members of the clubs on the Mississippi have had in view the steady development of the sport. Steps have been taken to provide better means of access to the course of the St. Louis clubs, so that it may be possible to hold the regatta of the Mississippi Valley Association there next year on the Lake of the Clouds. A new boat building firm from Arsenal Island to the Illinois shore, which will provide a sheltered stretch of water three or four miles long and half a mile wide, upon which boats could be started abreast, doing away with the obnoxious system of heat racing. The Mound City Rowing Association have selected September 1 as the date for their annual review, and have invited the University and Marine clubs to participate. The St. Louis Club expects to make a trip up to Alton in their renovated *Enterprise*, and have other long pulls on the tapis. A new boat club has been organized at Alton, Ill. The old puritan prejudice against the honest enjoyment of a pull on Sundays seems to have given way at last to more liberal principles, and St. Louis crews are not afraid to show themselves in their boats on the first day of the week. Mocks have a champion crew actively at work. Koots has already organized a club and boats have been ordered from Philadelphia. The boating fever may be said to be decidedly on the increase in the West and in the neighborhood of St. Louis in particular.

WHITESTONE REGATTA.—The gentlemen, sojourning at the Whitestone House, Whitestone, L. I., held an impromptu regatta August 14. Course, one mile and a quarter. Entries: No. 1, Ferdinand Gondoli and Charles W. Garrison, red and black; time, 7m. 14s. No. 2, Sidney H. Nealy and Frank M. Locke, red; time, 8m. 10s. No. 3, John Braden and James C. Moore, blue; time, 8m. 18s. No. 4, A. J. A. and J. A. A. and William H. Ordway, time, 8m. 19s. Messrs. Gondoli and Garrison were the winners. Prizes were awarded by Mrs. and Mr. Brewster Kissam, and consisted of a silk penant and gold badges.

NATIONAL REGATTA.—Full reports of the great event of the year—the National Regatta of the National Association of Amateur Oarsmen, held at Newark Tuesday and Wednesday last, will appear in our issue of next week.

DETROIT VS. MICHIGAN.—After the Detroit men the four-oared scull race at the Detroit River Navy regatta, the Michigan four challenged the Detroit crew. The race was won by Michigan, once accepted. Aug. 16 was fixed for the race. Course, one mile and return. Mr. J. N. Ostrom, of the Excelsior, was umpire. Crews: 1.—Detroit—Bow, James Craig, Jr.; No. 2, C. B. Hodges; No. 3, W. J. Gray; stroke, Walter Rowan. 2.—Michigan—Bow, J. Hurley; No. 2, E. Nolan; No. 3, C. Cable; stroke, J. W. Holmes. Detroit pulled 38 strokes in good form, most of them met with a mishap at the sliding seat. Michigan was pulling faster, turned first and worked up to 44, coming in winners in spite of a crab, in 13 minutes 3 seconds, Detroit 13 minutes 20 seconds. The Michigans were challenged by the Excelsiors immediately after the race, and the latter have also challenged the Monroe crew for a short course. Answer not yet received.

RAISING ON THE PASSAIC.—A single scull race took place on the Passaic, at Newark, Aug. 18, between William Barry, of Jersey City, and John Eckford, of Newark. Course, three mile straight away. Eckford won the lead and maintained it throughout the race. Time 28 minutes.

RAISING AT NIAGARA.—The consolation race for the men defeated at Barrie, Ont., which was held at Niagara, Aug. 17, was a great success. It was held under the auspices of the Hahn Club and the Queen's Hotel, Toronto, and the Queen's Royal, of Niagara. The first event was one for heavy weights. Entries: Charles Perry, of Toronto; Thomas McGraw, proprietor of the Queen's Hotel, Toronto; Mr. J. A. McFar, of St. Catharines, and T. A. McLean, of Toronto. Won by McGraw after a close contest. Miller second. For the single sculls, were entered: Evan Morris and H. Coulter, of Pittsburgh; Ed. Ross, of St. John, N. B., and W. McKim and A. Elliott, of Toronto. Judges, Messrs. Wallace, Ross, and J. A. Hosmer. Starter, T. Plaisted; time-keeper, P. Luther and Hahn, referee. Course one mile, twice around, making a distance of four miles. Coulter took the water first, but McKim won after a close contest. Miller second. They all turned the nearest buoy, and on the run back Ross spurted going to the front with 40 strokes. At the next turn McKim upset and was rescued by Coulter. Ross kept his lead, pushed closely by Morris and Elliott ten lengths behind. Ross won by half a length in 29m. 27 1/2s. Prize, a purse of \$250.

METROPOLITAN REGATTA.—The date for closing entries for this regatta has been extended to Aug. 28. A large number of crews will take part in the event.

SCULLING IN VIRGINIA.—The race between George Weisberger, of the Brown Boat Club, and Louis Felsing, of the Nail City Club, for a purse of \$500, came off at Beach Bottom, above Wheeling, W. Va., Aug. 17. The men were well matched; Felsing made a spurt and came in one and a half lengths ahead. Time, 20m. 40s.

SCULL RACE AT ROCHESTER. N. Y.—Mr. Editor: A scull race took place last evening on the Genesee River, above the dam at Rochester, over a two-mile course, between J. B. Durand, D. C. Sully and W. F. Sandway, amateur oarsmen of this city. C. H. Haskin was chosen referee, and James Mallory time keeper. Soon after the third "Go" it was evident who would win, Durand leading at thirty-four strokes to a minute. Sully following at thirty. At the turning point Durand brought about quickly, gaining several lengths on Sully, who made a very slow turn. The race was won by Durand in 14:40, followed by Sully in 15:10. Sandway came in with a broken toe strap. Durand was presented with a handsome blue silk sack, worked with white. Sandway received a leather medal, inscribed—

TO WILLIAM F. SANDWAY.
As a token of valor and skill in not winning the single scull race on the upper course of the Genesee River, August 15, 1878.
This medal is awarded with the exhortation, "In Turpitis remis."
ROCHESTER, Aug. 16.

FAST TIME IN A CANOE.—Mr. Editor: Your correspondents give some pretty fast time in their account of "Four Weeks in Canvas Canoes"—two miles in three minutes through a rift. I am a canoeist, and I have traveled a shade faster than your correspondents. My boat's trials may be found somewhere. She was set on fire by the friction, and "I only am escaped alone to tell you."
New York, Aug. 16.

CANOEING IS OPEN WATER.—The canoes, *Clockette* and *Star*, which cruised from this city to Newport, R. I., were both wooden canoes of lapstrake build, the former a Shadow and the latter a Rob Roy model.

Sea and River Fishing.

FISH IN SEASON IN AUGUST.

FRESH WATER.	SALT WATER.
Trout, <i>Salmo fontinalis</i> .	Sea Bass, <i>Scolopagus ocellatus</i> .
Salmon, <i>Salmo salar</i> .	Sheepshead, <i>Archosargus probatocephalus</i> .
Salmon Trout, <i>Salmo concolor</i> .	Striped Bass, <i>Morone virginatica</i> .
Land-locked Salmon, <i>Salmo gairdneri</i> .	White Perch, <i>Morone americana</i> .
Grayling, <i>Thymallus tricolor</i> .	Weakfish, <i>Cynoscion regalis</i> .
Black Bass, <i>Micropogonias salmoides</i> .	Bass, <i>Morone saxatilis</i> .
<i>M. nigricans</i> .	Spanish Mackerel, <i>Cyprinus maculatus</i> .
Muskellunge, <i>Esox nigrilobus</i> .	Cornell, <i>Sciaenops ocellatus</i> .
Yellow Perch, <i>Perca flavescens</i> .	Kingfish, <i>Megascops asio</i> .

FISH IN MARKET.—RETAIL PRICES.—Bass, 25 cents; bluefish, 8; salmon, 25; mackerel, 20; weak fish, 10; Spanish mackerel, 25; green turtle, 10; halibut, 15; haddock, 6; king fish, 18; codfish, 6; black fish, 10; flounders, 8; porgies, 8; sea bass, 18; eels, 15; lobsters, 10; sheepshead, 20; scallops per gallon, 32; pompano, 25; hard crabs, per 100, \$2.50; soft crabs, per dozen, 75 cents.

Spanish mackerel unusually scarce and high. It looks as though the catch on Long Island would be a failure; sheepshead abundant, from Barnegat; bluefish in moderate supply, from New Jersey and Cape Cod; some very large bluefish received from Portland, Me., an unusual circumstance.

NEW BRUNSWICK.—Black bass fishing on the Richelieu River, near St. Johns, is very good at present.

NORTH SHORE OF LAKE SUPERIOR.—Indianapolis, Ind., Aug. 15.—This summer we coasted the north shore of Lake Superior, from Silver Islet to Sault Ste. Marie, fishing lake and streams whenever we felt like it. We did not, however, go up the Neigpon. Rock fishing was poorer than usual. The lake is eighteen inches lower than usual, and the streams all exceedingly low. Some streams I had formerly fished were nearly dry, and fishing impracticable; others good. So I had better and poorer fishing than ever before. Our finest fishing was off the rocks. I took two at one cast—one 23 1/2 and the other 18 1/2 inches long—and immediately after two others, 17 1/2 inches long. All *Salmo fontinalis*, of course. C. O. H.

FISH PARADISE.—Editor Forest and Stream: About one mile long, half a mile wide, in places very deep, water very cold, fed from bottom springs, clear as crystal and surrounded by mountains. This is the little lake where the prettiest of all trout abound. It is a pleasant day's journey from New York, and yesterday I took seventy trout from its bright waters, the majority reaching one pound in weight. With many of their kindred they reached home as fine and hard as when taken from the river. Here, as in most other favored spots, the spring time is the best to take trout in quantity, but they abound in such profusion that a fine mess can be made at any season. Sherbrooke, P. Q., is the centre of a fine trout country. To the west, in Broms and Bolton, some 20 miles, are dozens of little lakes all containing trout, and if one prefers pounders to the whales of Rangeley, this is the spot to rather than the south, some twenty miles, is the Avonville Lake, a splendid water for pounders with 19 miles eastward, in a dense wilderness, lies Lake Megantic, where trout were taken this season that marked the four pound notch. The fish here will not weigh less than a pound each, fight like "all possessed," and no other fish inhabit the lake. Three miles east of Barton, Vt., which is fifteen miles south of Newport, lies May's pond—a grand little sheet of water one mile in length where a basket can be filled with "whoppers" in a short time. Lunge in Memphremagog are scarce this summer, and pickers also have "gone west," but perches are taken in great numbers, for some feed stocked the lake with them, and they have multiplied amazingly. Black bass have been put in and will be sizable to take next summer. To reach this country take the S. M. train from Springfield, Mass., over the Connecticut river and Passumpsic River railroad, reaching Newport and Memphremagog at supper time, and Sherbrooke at 9 p. m. The trip over these roads is one of great beauty, with ever-changing scenery, touching the Green and White Mountains, and winding along the two charming rivers nearly to their source.

Herbert, P. Q., Aug. 16th.

KIT CLARKE.

NEW HAMPSHIRE.—Crawford House, White Mountains, Aug. 16.—Trout are plenty and of good dimensions. Hooked 75 to date, the largest weighing 11 oz.; length, just 12 inches. Ammonoosic and Dry rivers are the best streams.

NIMROD.

MASSACHUSETTS.—Nantucket, Aug. 17.—This has been a poor week for bluefish. Owing to the wet weather the fish swim deep. The largest catches are as follows: *Flora delmar*, 72; *Undine*, 61; *Thorn*, 53. Sharks very plentiful. Perch caught in great numbers; one party of three, Wednesday, caught 601 in one hour and fifty-two minutes, and the same day I caught a yellow perch 15 1/2 inches long.

JACK CURELW.

MOVEMENTS OF THE FISHING FLEETS.—The arrivals for the past week have given a more hopeful aspect to the fishing outlook, and our wharves have presented the busy appearance which characterized them in more prosperous seasons. The arrivals have not been numerous, numbering 50 in all, but some very good fares have been landed in the several departments of fishing, followed by Gloucester vessels. There have been five Bay arrivals. The Shore fleet continue to report a scarcity of large mackerel, though a few 25 and large 30s are called from most of the trips. The number of arrivals for the week has been 6. The Bank cod fishermen have commenced to put in an appearance with favorable reports, and the receipts in this department have been much larger than for any previous week this season. Arrivals, 9; total catch, 1,180,000 lbs. The number of halibut arrivals for the week has been 7. The number of Georges arrivals has been 29, and the receipts 290,000 lbs. codfish and 17,000 lbs. halibut.—*Cape Ann Advertiser*, Aug. 16.

RHODE ISLAND.—Narragansett Pier, Aug. 14.—A large turtle was caught off Point Judith. Tuesday it was entangled in the lines of a lobster pot and towed to the pier by a rope fastened to its fore flippers. From nose to tail it measures 7 1/2 feet, and from tip to tip of fore flippers it measures 8 1/2 feet. Its upper parts are black; under shell pink and white. Its back shell was quite hard (though not as hard as a common water turtle) and had five ridges running its entire length. The largest ridge about three inches high. The top and under shells were joined at the sides by two pieces. The turtle could not draw in its head or flippers. The throat was covered with pink and white spots. The turtle died yesterday. F. R. WELSH.

LONG ISLAND.—Sayville, Aug. 18.—E. Backus and friends, from Nassau, N. Y., fishing at Sayville, L. I., caught 285 blue fish in about four hours, chumming. A lady took 77 of them. They were an even run of about 2 pound fish and very game. The removal of the pound nets undoubtedly has much to do with the large quantities of fish in the Great South Bay this year.

BASS AT MONTAUK POINT.—Philadelphia, Aug. 10.—Last week at Montauk Point, L. I., J. B. Stearns took six bass weighing 11, 6, 2 1/2, 10, 18 and 13 pounds each. G. B. Stearns, Jr., caught twenty-one, weighing respectively, 19 1/2, 12, 2 1/2, 4, 9, 16, 10, 12, 15, 15, 23 1/2, 23 1/2, 3, 7, 23 1/2, 12 1/2, 7, 11 and 16 pounds. L. Stearns caught six which weighed 35, 18 1/2, 16, 10, 15, 10 pounds. These were all taken within three hundred feet of each other on Montauk Point. I have fished Pasque Island for the last six years, but this time they ate them all. JUSE.

NEW JERSEY.—Kinsey's Ashley House, Barnegat Inlet, Aug. 19.—Weakfish biting freely. J. N. Kirby, Phil Mulloy and T. A. Henderson, N. Y., took 74, averaging 9 lbs. Y. bluefish, 19 bass; John O. Hughes and boys, Phila., 67 bluefish; Wm. Steel, Lewis Jamison, Bordentown, N. J., 26 bluefish; W. H. Dodge, of Towanda, Pa., 25 bluefish; A. D. Hughes and friend, Bordentown, 43 bluefish; C. W. Hancock, 30 blackfish; H. L. Lewis, and P. P. Shirkwood, N. Y., 33 bluefish; H. L. Lewis, F. Miller, F. C. Edson and Wm. Birney, Jr., Elizabeth, 25 bluefish. Sheepshead were biting good until Friday. Thursday some 300 taken off the grounds. On Friday night a party from Watertown with a large haul swept the channel at the sheepshead ground, and since then not a bite has been felt nor a fish taken. Thus one small party destroyed the livelihood of some seventy-five poor men, who have for the last two months been making from \$4 to \$10 per day with their line. Cause: Political interference with our State Commissioners, thereby depriving our county of a varden. B.

"COME PREPARED TO ROUGH IT."—That is the injunction which accompanies and supplements the graceful invitation sent out to the friends of the "Solid Comfort Fishing Club," of Mercer, Pa., who are now in camp at Sugar Lake, seven miles from Cochranton. The club is made up of officers, an executive committee, and the rest of the fellows, nineteen altogether. There is the solidest kind of comfort in the roughest of roughing it, and so long as the fish bite and the bait holds out may the Sugar Lake Campers get rest unto their souls.

THE FRASER RIVER SALMON SEASON.—A correspondent of the New York World writing from New Westminster, British Columbia, under date of Aug. 16, says that in that land of pike and picker, salmon are selling at one cent each.

The "run," as the fishermen call it, has been unprecedented. Indeed, the canneries have more fish than they know what to do with, and thousands of the dead salmon are daily thrown into the river because there are not men enough to can them. Each cannery is turning out from 400 to 1,000 cases daily. The profit on each case varies in different years, according to the run of fish, from \$1.50 to \$3.50; this year it will probably be more. The Chinamen do all the work after the fish is landed. The fishing is done principally by Indians. A good many people say that the present run may be expected every year, as they urge that until now the correct mode of catching the fish has not been understood. Several of the canneries are not only canning salmon, but have begun to salt the fish and pack it away in barrels. A good many people in this colony cry out against the employment of Chinese labor. But for the Chinamen the fisheries would not exist; it would be impossible to obtain white labor to do the work. Indeed, the cannery proprietors would be very glad to get whites. The season lasts for a few weeks only, and at the end of that time the men would be out of work. The Chinamen board themselves, and at the end of the "run" take themselves off.

AN ENO FROM MICHIGAN.—Editor Forest and Stream: A short and pointed article in FOREST AND STREAM of July 18, entitled "Hogfishiness," reprehends the ideas of too many

who wield the rod and are adepts in taking trout. Not content with taking such large numbers of fish, they blazon the weight and number of their fish through the land. Thank goodness there are some followers of the gentle art who have a conscience in taking fish in other things. Three gentlemen went on the famous Jordan fishing, and could "yank them out" all the day until anything like sport sufficed them. They caught 200 the first day. At the camp-fire that night the matter was discussed. One of the party said, "Here is an agreement. We will confine ourselves to 30 trout per day, no matter how they may be biting, or I propose to break up camp and go home." We have not degenerated to barbarism if we have left the city behind us." They were to use just what bait one pleased, worms, grasshoppers or the fly. I need not say that they enjoyed themselves. Trouting at that time was the finest sport on the Jordan, and these gentlemen came home to the camp with fine trout, taken legitimately with a fly. Not a trout put into their creels under six inches. Yet they caught more than enough for their own use. The Jordan, Boyne and Manistee on this side of the lake, and Au Sauble on the Huron side, cannot stand such a drain on them as was reported in the month of June. Though during July, when the crickets were swarming, and the trout were out of the sun, you could not persuade the trout to take the daintiest bait, and it was only in the early morning or in the gloaming that fish would bite, even though they were breaking the water before sunset.

Chicago, August 15.

NORMAN.

SHARKS.—The shark is making himself more of a nuisance than usual this summer. He has been an unwelcome visitor at Long Branch, Brighton Beach and other popular watering places. The coast fishermen complain that the man-eater is giving them much trouble. The fishermen at Short Beach, Conn., caught one in a net the other day. He was nine feet long and very ferocious. He bit a piece of timber, four inches by two, in pieces. His big jaws were furnished with formidable teeth. One six and one-half feet long was killed after a hard fight by men in a boat off Plum Beach, in Westcott's Bay, on Monday, the 12th. A fisherman near the mouth of the Housatonic, the other day, hooked a fine striped bass, but a big shark came along and away went the fish, fishing tackle and angler's temper. We have had the same trick played on us many a time in Florida waters.

BAIT FOR FISHES AND SEA BASS.—Use large angle-worm for bait. The fish take this bait quite as well, and it remains on the hook much longer than clams.

E. R.

BLACK BASS ANGLING.

EDITOR FOREST AND STREAM:

Having received letters from several gentlemen desiring a "more in-depth" subject of black bass fishing, and more especially in regard to casting the minnow, I propose to dispense said "light and knowledge" through the effulgent columns of the FOREST AND STREAM to all uninformated brother anglers.

A faithful study of the conformation, habits and idiosyncracies of game fish should be the first consideration of the true angler, but the average angler usually contents himself with a superficial knowledge of the ways and means of capturing and killing the finny tribe, a big catch being the height of his piscatorial ambition. While good tackle is essential to success, a thorough knowledge of the habits of the fish is a *sine qua non*, without which no one can become an expert and successful angler. Apropos of this might be mentioned the old and hackneyed story of the rustic youth with a split bamboo and well-filled fly-book, who indulged in a fish's fishing on the same stream, with the result of a "big string" for the boy, and one poor fingerling for the disgruntled sportsman. The boy understood the "true inwardness" of the trout, while the discomfited citizen was lamentably ignorant, and relied entirely upon his splendid rig for success.

While the black bass are plentiful, as in the quiet ponds and lakes of Western New York, Northern Indiana, Michigan, Wisconsin, Minnesota, and at the Thousand Islands, the merest tyro, who can throw his bait twenty feet from the boat, can, when the bass are in a biting mood, show a big catch, though he may have necessarily failed to land two out of every three fish hooked. But on rivers where the angler casts to the right, and where the stream is not so shallow, and where the angler is fishing the shallows and bars, and the bass are shy, educated, and fully up to a knowledge of the stream in its windings, eddies, pools and rapids, the highest skill and a thorough knowledge of the habits of the fish are indispensable to a full creel, and this, at the same time, constitutes the pleasure and perfection of black bass angling. But bear in mind, that sticking the butt of a long rod in the bank, and then, while reclining on the other side, waiting for the fish to rise, is not angling, but simply loitering, and attempting to obtain bass under false pretences. The artistic angler will use nothing but the best tackle, essentials of which a short plant rod, a freely rendering reel and a suitable line. The perfect black bass rod would be a split bamboo, in one entire length, without joints, about eight feet long, and weighing about one and one-half pounds. It would be quite costly and difficult and expensive to repair, and could be carried about only with extreme risk. I merely mention it. The next best would be composed of the same material, of the same length and weight, in two or three pieces or joints. Next in order, not nearly so costly and really more serviceable, is the ash and lancewood rod of the same weight and length, with the same relative degrees of pliancy and elasticity. The Orvis rod of the first-class New York multiple-piece rod made. Mr. F. A. Strong, of Honesdale, Pa., is now making an ash and lancewood rod in two pieces or one joint, which approaches more nearly to my idea of a black bass rod than any I have seen; it is from 5 to 8½ feet long, just right in weight, balance and pliancy for making long casts, and plays a bass superbly. B. C. Milani's "Frankfort Reel" is by far the best of the kind. The Orvis reel is the best three-piece rod made. Mr. F. A. Strong, of Honesdale, Pa., is now making an ash and lancewood rod in two pieces or one joint, which approaches more nearly to my idea of a black bass rod than any I have seen; it is from 5 to 8½ feet long, just right in weight, balance and pliancy for making long casts, and plays a bass superbly. B. C. Milani's "Frankfort Reel" is by far the best of the kind. The Orvis reel is the best three-piece rod made. Mr. F. A. Strong, of Honesdale, Pa., is now making an ash and lancewood rod in two pieces or one joint, which approaches more nearly to my idea of a black bass rod than any I have seen; it is from 5 to 8½ feet long, just right in weight, balance and pliancy for making long casts, and plays a bass superbly. B. C. Milani's "Frankfort Reel" is by far the best of the kind. The Orvis reel is the best three-piece rod made.

In casting for black bass, having properly adjusted the rod, reel and line, tie on the swivel by one of its rings, and loop the end of the hook under the other ring of the swivel, and draw the line through the under lip and out at the nostril of a good-sized minnow, say four inches long; reel up the line until the swivel touches the tip and make a cast. But how? Aye, there's the rub. The instruction can hardly be conveyed intelligibly by mere words, but with the help of the diagram below. I will endeavor to make it, at least, partially understood by the uninitiated.

The angler is supposed to be standing at A, facing N, and his shoulders in a line with X Z. Casting the minnow is an entirely different process from casting the fly. A minnow can be cast but a very short distance immediately in front of the angler, and all long casts must be made sideways, that is, to the left or right. To make a long cast to the left we will suppose X to be the objective point to which the minnow is to be cast. The angler now grasps the rod immediately below the reel with the right hand, with the thumb resting lightly but firmly upon the spool; the right arm is now extended downward, slightly bent, with the elbow near the body, and with the extreme butt of the rod nearly touching the right hip; the thumb and reel are upward, inclining slightly toward the left; the tip of the rod, or rather the minnow, just clears the ground or surface of the water; the position of the rod is now the direction of the line A B, inclining toward the ground or water, making an angle of about 45° with the line of the shoulders, X Z; this is the situation at the beginning of the cast. Now for the cast: The angler turns his face toward X, the objective point, looking over his left shoulder without turning his body; he now inclines his body in the direction of B, advancing the right foot and bending the right knee slightly, and makes a sweeping cast from the right to the left, and finally draws upward, across the body diagonally, until the rod hand is at the height of the left shoulder, and the arm and rod extended in the direction of A C, with the tip of the rod inclining upward. The movement of the right

hand is almost in a straight line from a point near the right hip to a point near the left shoulder; the motion is casting steady, increasing in swiftness toward the end of the cast, and ending with the "pitching" of the bait—instead of a violent jerk—somewhat similar to the straight underhand pitching of a base-ball. In making the cast, the right elbow should touch the body, sweeping across it, and only leave it at the end of the cast, making the forearm do the work. At the end of the cast the reel and thumb are upward, and the rod forms an angle of 45 degrees with the line of the shoulders X Z, and the minnow instead of following the direction of the rod A C, as some might suppose, will diverge toward the left, and drop at X, when the thumb should immediately stop the reel by an increased pressure. Casting to the right is just the reverse of the above proceeding. The angler being in the same position, brings the right hand across, and touching the body, to a point in front of the left hip, the thumb and reel upward, and inclining toward the body, and the rod extending in the direction of the line A C, with the tip downward; he now turns his face in the direction of the objective point Z, inclines his body and advances his left foot in the direction of C, and makes a cast from left to right, and from below upward, and ends the cast with the right arm and rod fully extended in the direction of the line A B, while the minnow takes its flight toward Z. In making a cast to either left or right the body should sway or move slightly in the direction, and simultaneously with the rod arm; it will give force and steadiness to the cast; but on no account must the body be turned around or the feet moved during the cast; let us be graceful if we cannot be proficient.

The first cast that the beginner makes will be likely to throw the bait behind him; this will be because he will not hold the cast in time, but carry the tip of the rod too far toward the line X Z. He should by all means begin by making short casts, and lengthening them as he perfects himself by experience in managing the reel and controlling the cast. And now, having given him the principles of good and artistic casting, nothing but patient practice and good judgment, together with a fair knowledge of the habits of the fish itself, will make him a proficient in black bass angling.

Cynthiana, Ky., July 29, 1878. J. A. HENSHALL.

FISHING IN NORTHERN CALIFORNIA.

EDITOR FOREST AND STREAM:

As you and some of your numerous readers no doubt know long before this, the Sacramento, Pitt and McCloud Rivers, near Mount Shasta, afford some of the best salmon and trout fishing to be found on the globe. Sir Rose Price, a gentleman who has fished in some of the best countries for this sport in the world, states that the trout fishing in these rivers and their tributaries is the best he ever experienced, when the numbers, games, size and quality of the fish in these cold, clear and rushing rivers are considered. To be sure, about this time of the year when the salmon are spawning, the fly is of very little, if any use, but very early or quite late in the season, in some, if not all of these streams, they take the fly pretty well. The cause of their not rising to the fly is that in the months of June and July, perhaps earlier or perhaps later than this, it may happen the trout are feeding upon the salmon roe that is floating down the stream or are disinterested in the game of fly fishing, and are busy with the roe, and which although fiercely guarded by the male salmon, who remains by the female while discharging her eggs, and, after dropping his milt over them, drives, or attempts to drive, off all intruders; of course including the trout and perhaps others of his own kind and kin, who are known to be very destructive even of their own particular kind. This is especially the case where the holes are deep, a little away from the swift current, and where great numbers of salmon rest, and which about the latter part of the season is especially true, and it is even reported at some of the houses or hostleries in this region that some white fishermen and Sir Rose Price himself (but we trust that this last report is not true), by means of clusters of hooks attached to strong lines and heavy sinkers, and drawing them rapidly through the water, struck the fish fast and captured many of them in these places by these means.

Every year the numbers of fishermen who resort to these waters as the *me plus ultra* of angling spots, and their neighborhood as the habitation of deer and many varieties of the larger game, are increasing. Those who can afford the time and means have a grand time of it. They generally camp out either on the shores of one of the many rivers which, flowing from the base of Mt. Shasta, form the Sacramento, Pitt or McCloud, or on one of the latter. The canyons are heavily wooded with magnificent old trees through which these pure and cold waters from melting snow flow. These visitors feast on venison, trout and any other portable provisions they may choose to bring with them or

obtain from the well provided public houses, and the best sauce the possess is a good appetite. Whatever may be the liquid cordials these procure there is always near them the liquid element well iced, and if they desire a physical tonic or bracing it is always convenient for a bath. There is a pretty long stage journey from Hedding, the terminus of the railroad from here, but men who can camp out and fish, are supposed to be well able to stand a day and night's travel and a strong shakedown. The scenery, to lessen the fatigue, is picturesque and indeed magnificent. Here are the primal forests, pine thicketed mountain air and never failing sport with the trout and salmon ahead, as the fish seem jumping everywhere in the passing streams alike. The salmon that are taken this time of year average about twelve pounds each. There are so many of them to be captured with salmon roe, the only bait they now take, that this kind of fishing soon becomes monotonous. The attention after a little while is turned to brook trout and Dolly Vardens. It is quite common to catch fifty of these per day, averaging about a pound each. The Dolly Varden is the rarest sort to bag. The trout weigh heavier, are gamier than the brook trout, have some yellow and red spots on their sides, but are, not so beautiful either in shape or color, not so good in the quality of their meat. The supply of ash here is inexhaustible, and the charm of fishing would be as much so could they be creelied by means of the fly instead of the roe-bait. But what a splashing and struggling and excitement there is on the shores of these thickly peopled waters at any rate, and upon the whole the trip to a thorough angler and lover of the grand and beautiful and the healthful cannot be other wise than highly satisfactory and a delightful.

E. J. HOOPER.

Game Bag and Gun.

GAME IN SEASON FOR AUGUST.

Woodcock, <i>Philohela minor</i> .	Red-backed sandpiper, or ox-bird, <i>Tringa americana</i> .
Black-bellied plover, ox-eye, <i>Squatarola bicolor</i> .	Green-winged teal, <i>Anas carolinensis</i> .
Ring plover, <i>Actitis semipalmata</i> .	Lincoln's sparrow, <i>Spizella lincolni</i> .
Song sparrow, <i>Melospiza cinerea</i> .	Willow, <i>Salix viminalis</i> .
Song sparrow, <i>Melospiza cinerea</i> .	Willow, <i>Salix viminalis</i> .
Red-backed snipe, or dowitcher, <i>Macrorhamphus griseus</i> .	Yellow-throat, <i>Geothlypis trichas</i> .

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf scur, phalaropes, avocets, etc., coming under the group *Limosa* or Shore Birds. Many States permit prairie fowl (plumbeous grouse) shooting after August 15.

SOUTH CAROLINA—Charleston, Aug. 10.—Since the 1st of August several parties have been out after deer, and all have had capital sport. On Monday a yearling and buck were brought in, and on Wednesday a doe and fawn were brought in. Deer are reported plentiful, and the outlook for capital sport this fall and winter is very bright.

INDIAN TERRITORY—Muskegon, Creek Nation, Aug. 12.—A word from this part of the world would, perhaps, be appreciated. Our summer has been unusually hot, but the grouse or prairie chicken, as well as quail, have not been idle, and have brought out big broods. Our shooting season has nicely opened; two gentlemen of St. Louis paid me a visit. We went out to Tar Springs, nine miles, camped over night, and returned with one hundred chickens. Large flocks of quail were seen, but are yet too small to shoot. Turkeys are plenty, but the cover is so thick that dogs are unable to work them.

D. G.

FOUND.—On Saturday, Aug. 17, at Brooklyn Driving Park, a gold badge. Apply to Daniel Green, corner of Court and Pacific streets, Brooklyn.

THE BONEHILL GUN.—Mr. Homer Fisher, of No. 260 Broadway, New York City, offers an exceedingly good and cheap gun to sportsmen. The Bonehill gun has extension rib, rebounding locks and all improvements. Mr. Fisher keeps on hand all varieties of arms and ammunition. From time to time in our advertising columns, Mr. Fisher proposes exhibiting one of the various styles of double break-loading guns he has on hand. A new patent brass cleaner for rifles, for sale by Mr. Fisher, we recommend very highly.

A "PIRATICAL SKUNK."—*Editor Forest and Stream:* In your issue of July 4, which I read on my table at the restaurant, I found an inquiry: "What is a piratical skunk?" From an account given me by a gentleman who "was there," possibly I may be able to give you a little light on the subject. It happened that two parties, each with its own boat, had been fishing in one of the many trout streams emptying into Lake Huron between Mackinac and Detour, and, breaking camp on the lake shore one morning, had the luck to shoot a lone haddock. The boats were loaded and ready to start, when another haddock was discovered making his way into one of the boats. As one of the gentlemen was something of a naturalist he thought a live specimen would be an acquisition, and it was determined to push off and secure the animal. So the boat was pushed off to a safe distance from shore, and the search was commenced in the baggage. After a very thorough tearing up of the contents of the boat, the two gentlemen found, safely landed in the very bottom under a box, not a haddock, but a fine, well developed specimen of the *Mephitis Americana*. Not standing upon the order of their going, they went at once, "walked the plank," incontinently jumped overboard, plunged and rose again, but did not give up the ship. They clung to the sides of the boat and held a hurried consultation. So far their enemy, though master of the situation, had not resorted to his most effective weapon, and they determined to get the boat in shore and try to recapture it. By dint of considerable swimming and wading and pushing and pulling they stranded the boat on the beach and quietly retired to a safe distance to devise measures of relief as well as to await developments. Once the skunk made his appearance with defiant menaces on the bows, but soon disappeared beneath the plunger. The situation was now becoming desperate. The other boat refused to give assistance—indeed, it could not—but waited to see results. Active measures were determined on, but the maxim about discretion and valor was kept prominent in their minds. So, very quietly, and piece by piece, all the contents of the boat that could be managed with poles were taken out, leaving only a few of the heavier articles in the bottom. As the sun was hot the skunk's quarters became very warm, and he, in his impatience of his conquest, he jumped ashore. A charge of shot from the ambushed enemy flushed him without other ill effects than the loss of the boat's painter, which became impregnated with mephitoid odor during his dying struggles. Then there was a hurried embarkation, and that naturalist is now of the opinion that he will never again mistake a *Mephitis Americana* for a haddock. The personal observations of the former's habits

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, Aug. 23.—Chicago Yacht Club Cruise to Lake Winnebago. Trotting: Earlville, Ill.; Newark, N. J.; Fowlerville, Mich.; Warren, O. Running meeting at Saratoga.

Saturday, Aug. 24.—Nahasset Yacht Club Regatta at Cohasset, Mass. Cricket: St. Timothy vs. Wakefield, at Roxborough, Pa. Trotting at Warren, O. Running meeting at Saratoga.

Sunday, Aug. 26.—Brooklyn Yacht Club Annual Cruise. Trotting at Lincoln, Ill.

Tuesday, Aug. 27.—Trotting: Paterson, N. J.; Pittsburgh, Pa.; Milwaukee, Wis.; Fairville, Conn.; Sycamore, Ill.; Macomb, Ill.

Wednesday, Aug. 28.—Metropolitan Association of Amateur Oarsmen Annual Regatta. Trotting as above, and at Wolcottville, Conn., and Waterloo, N. Y.

DUSSELDORF.

WE are glad to notice that our comments on the German Fest, with the letter of Mr. Farrow from Dusseldorf, published in our last issue, have been so widely noticed.

We rarely espouse personal quarrels. What others think of us, or what they may write, we are utterly indifferent about; but acts of discourtesy shown to our people when abroad we are quick to resent. If Mr. Farrow did go to Germany as the representative of a leading firm, who manufacture the Ballard rifle, that is no reason why Mr. Farrow, who is a straightforward man, known especially for his modesty and retiring disposition, should be treated rudely at Dusseldorf. Mr. John Rigby was a representative member of the Irish team, and at the same time the most noted of rifle makers. It certainly made no matter at Creedmoor what was Mr. Rigby's calling. This gentleman made innumerable friends from his skill, pleasant manner and courteous behavior. But whether he had been John Rigby, a rifleman alone, or a rifle maker, we fancy his reception would have been quite the same in the United States. We have a right, then, to draw this parallel. The kind greeting the American team met both in England and Ireland we are most grateful for. We do not, then, feel pleasantly when we learn of the treatment received by Messrs. Farrow and John at Dusseldorf.

BRITISH RIFLE TEAMS.

A RECENT article in the London *Field* (July 27) upon "team shooting" shows that the British press has at last begun to realize the secrets of team shooting and to appreciate what is necessary to be done before the "Palma" can ever be brought to British shores. In the opinion of our most unprejudiced shots the *Field* is correct in considering discipline and training as the most important point connected with the successful management of a team, and that the next most vital thing is position, the selection of the rifle being last in importance. Without the absolute surrender of individual opinions and jealousies, the team resolves itself into an individual contest. Hitherto foreign riflemen never seemed to understand that it is better to "follow your leader," knowing him to be wrong, and thereby prove that fact, than to throw away his experience when it may happen to conflict with your own judgment. The result of the last match at Wimbledon for the Elcho Shield would seem to prove that the Irish at last have grasped this secret, as well as the value of the American "back position," which they all appear to have used.

A comparison of the Irish scores with those made by them in previous matches for the Elcho Shield and in the competitions at Creedmoor, shows a most marvelous improvement.

Considering the difference always found between the scores at Wimbledon and Creedmoor, it will be seen that the Irish already constitute a team which will give the best Americans who have ever got together as a team all they want to manage. From the testimony of the American riflemen who watched their shooting for the Elcho Shield they have but little more to learn in the way of team management. It may therefore be justly considered that all the difference existing between them and an American team is what will be caused by the difference in rifles. This we are inclined to think is now less than is generally supposed. We speak in the present tense, because the foreign riflemen using muzzle-loading rifles now take even more care to clean them perfectly than is done by an American with his breech-loader.

While slight advantages may arise from the form of bullets or mode of rising, as to which manufacturers differ, the true difference existing between a muzzle and breech-loading match rifle after all is mainly that the barrel of the latter can be cleaned more easily after each discharge; and, what is of much more importance, the rifleman can, by looking through the barrel, be certain it is clean before he loads. It has been claimed that the stiff, greased wad, which is forced down upon the powder in loading the muzzle-loader, was all the cleaning that was required, and that in consequence its manipulation was less troublesome than its American contemporary. This has proved to be a fallacy. As such it has been abandoned, and both rifles are now cleaned alike. When this is done, the argument as to the inconvenience of cleaning is at once shifted, and all the fancied advantages of the muzzle-loader are gone, and it becomes a clumsy, obsolete weapon.

The scores made by Mr. Humphrey with a Remington, during the Wimbledon meeting, show that with all the care bestowed upon the muzzle-loader it is still inferior in accuracy, and the devotion with which its adherents cling to it can only be ascribed to the tenacity (to use the mildest term) for which our British cousins are famous in adhering to old customs and old things. At the same time the record of Ireland's team is so superior as to afford every indication that next year will see their again at Creedmoor in a third contest for the Centennial trophy, in which America will do well if she is able to hold her own.

TOWN CUPS.

THE recent move of the inhabitants of Newport, R. I., in offering a "citizens," or "town" cup, to be sailed for by the New York Yacht Club, was a step in the right direction, though the donors were a little too late with their offer, as the fleet of the club was obliged to disband upon its return to Newport harbor. While the intentions of the citizens subscribing to the cup were, no doubt, of the best, there can be no harm in calling their attention to the advisability of taking more liberal council in future, and offering the cups not merely for any individual club, but of throwing the matches open to all comers. By confining entries to one club, the race becomes circumscribed in its importance and local only in its interest. It becomes a mere family affair. Since the congregation of yachts from all the ports along the coast in any particular harbor is evidently of much immediate profit to the merchants and general public of the town, it is hardly judicious to make any individual distinction in favor of one club over another, especially as all yachts contribute alike to the greater prosperity of the town fortunate enough to have them present in its harbor during the season. Had the Newport cups been offered earlier in the year, and the races thrown open to all comers, such action would have drawn together a large fleet of yachts, hailing from the Metropolis, Boston, the East and intermediate points, much to the benefit of the town. It is customary in England to offer public cups upon liberal conditions, and the experience gained at Cowes, Ramsgate, Torquay and many other yachting centres, has been so favorable that the annual recurrence of these events is looked forward to with quite as much interest among racing yachtsmen as the regular regattas, for this the entries for town cups stand witness. Our own gatherings of small open yachts at Newburg; the New York Bay Regatta and New Rochelle, as well as the many similar events in Boston harbor, where the Nahasset, Dorchester and Beverly clubs have been doing so

much toward the promotion of legitimate yachting, afford a reliable gauge of the popularity of public matches open to all comers. If it is desired to keep these races select, no trouble will be experienced in that direction by simply limiting entries to yachts of regularly organized clubs which have a recognized standing. What has been done for the advancement of yachting among open boats, should be immediately undertaken by those whose interests are merged in cabin yachts. So far, racing among the larger craft has been but a dull and dreary repetition of generally poorly attended club regattas. Remove the narrow choking limits of club entry only, and a vast change for the better will at once become apparent. Will not Philadelphia or Cape May, Oyster Bay, New Haven, New London, Stonington, Fisher's Island, Greenport, New Bedford, Nahant, Gloucester, Portsmouth, Portland, etc., take notice and offer public cups for competition next season? Let all these towns put their heads together, devise a common code of rules for measurement, classification and time, fix the events for such dates that a racing yachtsman may, if he wishes, attend them all in succession, let the cups be worth sailing for, and bring the events properly to the notice of the yachting public, and then, not until then, will yacht racing among the large craft be lifted out of its present doleful stagnation. It will take our yachts to sea a little more and the effect on model and seamanship will be of a wholesome and much needed sort.

TURF JOURNALISTS.

IT is a fact worth mentioning that the journalists of Chicago have organized a Jockey and Trotting Club: that is to say, they constitute such a component part of it as to be recognized as its most prominent feature, like the nose on a man's face. There is nothing singular in the adventure, however, and nothing that should suggest an incongruity in sporting circles; for Pegasus, the fastest flyer of early history, was owned, entered and handled by a literary quill driver, and in more recent times, but still before the age termed "fast," pony expresses were instituted to obtain the latest news in advance of the Government mails. From remotest date to recent times, newspaper men have been inseparably associated with the horse (or his immediate congeners), and to some of the most notorious of them the horse-whip has been an emblem and synonym of valor or dogged perversity. It is not remarkable, therefore, that the editors of *Chicago* should find their affinity on the turf and track, and seek recreation and health in the "troubing of the pool," as did the halt, the maimed and the bodily and mentally afflicted in Anno Domini days, eighteen hundred and sixty years ago. We've no doubt that the diversion will prove to all concerned a sort of "merry-go-round," and perhaps peculiarly advantageous. Our best wishes for their success attend each meet and heat.

The following are the gentlemen prominently associated in the new enterprise:

L. H. Don, Pres.; S. J. Medill, City Editor of *Chicago Tribune*, Vice-Pres.; Dr. N. Rowe, Secy.; Wm. Boyle, Asst. Secy.; Alvin Hulbert, Proprietor Sherman House as Treas. Col. H. W. Farrar, Manager *Chicago Evening Journal*; Clinton Snowden, City Editor *Chicago Times*; Geo. B. Armstrong, of the *Inter-Ocean* newspaper; Abner Taylor, Harry Pulling, of the *Commercial*, and A. Hulbert, of the Sherman House, constitute the Board of Directors.

The inaugural meeting takes place next October, 8th to 11th, at the new West Side track. Col. J. W. Conley, who has canvassed the eastern turfmen, says the project is everywhere greeted with enthusiasm, and that all the leading stables in the country will certainly be represented. He has made a definite arrangement with Rarus, Hopeful and Great Eastern to engage in a race together on the third day of the meeting, Rarus to go to wagon, Hopeful in harness and Great Eastern under saddle. In point of novelty this race will "lay over" anything of the kind ever seen, and that it will draw an immense crowd none will doubt. The pacers have also been provided with a purse. On the last day there will be a free-for-all race which, as Rarus and Hopeful are barred in it, should bring together a fine field of such flyers as Great Eastern, Proteine, Midnight, etc. The programme in full is as follows:

First Day—2:40 class, \$1,000; 2:30 class, \$1,000.

Second Day—2:25 class, \$1,000; 2:25 class, \$1,000.

Third Day—Special purse of \$3,000; Rarus to wagon, Hopeful in harness, Great Eastern to saddle.

Fourth Day—2:26 class, \$1,000; free-for-all pacing race for \$750, and free-for-all trotting race (Rarus and Hopeful barred) for a \$1,000 purse.

We shall watch this club of journalistic turfmen with a fraternal regard, and promote its interest so far as lies in our power.

FLAP-JACKS.

THIS is what the old plainsman told us. We had invited him to breakfast. There was a nice rash of bacon and eggs, a beefsteak, some Spanish mackerel and delicately-made French rolls; for if there is anything our cook prides herself about it is her French rolls. The bacon and eggs were appreciated, as were the fish and steak, and the rolls seemed to suit exactly the plainsman's taste.

"Not as good a breakfast as on the prairie?" we inquired. "I don't know. It's a combined meal, and a mighty square one, now mind I tell you," said the plainsman. "I see a lady writes sometimes for *FOREST AND STREAM* on eating, and gives you receipts how to cook things. That coffee with a stick we

tried, a whole lot of us fellows, on the Platte a month ago, and it was just bully. Guess the coffee-pot was kept a-biling all the time. There came along a lot of officers from the fort on a hunting trip, and mighty tuckered out they were. Their small stores had gi'n out. We just made coffee with a stick for those fellows, and they must have kept drinking it all night."

"You mean Miss Juliet Corson's receipts, we suppose?" we inquired.

"Yes, that's the lady's name. By thunder! the boys just drank her health."

"In coffee?"

"Yes, for there wasn't nothing else. See here, mister, liquor on the plains, when you go regularly in for a hunt, is scarce, mighty scarce. When I go trapping, and fill up with stores, it's about the last thing I think of. Rum is good for Indians, and not for white men. This here roll is as white as snow, and first rate in every way; but give me a good flap-jack. That's the best thing on nirth. Does that lady, Miss Corson, know how to make flap-jacks?"

"Well, the lady in question is a perfect encyclopedia of culinary lore, and we have no doubt but that she does. But we don't know. So pray enlighten us, and the readers of the *FOREST AND STREAM* shall have the benefit of it."

"I ain't going into print, am I? Well, I don't keer. Fust I must tell a little story. It was on the Medicine, three years ago, and there was a swell camp there—a lot of New York and Boston fellers—nigger cook and all that kind of thing. I struck their trail one morning and followed 'em up; seed a paper collar fust, and after that a tin fish-box—there, jest like that—and our plainsman indicated the sardines. "I jined 'em just after supper. They acted kind of hearty like, but the camp was cleaned out of cooked food. They made excuses for having no supper. I was downright sharp set, so I asked for some flour. They had a bag of that. Then I got some 'east powder, just as much as would cover a dollar piece; then the darkey handed me a frying-pan, and I mixed that flour with the 'east powder into a batter until the frying-pan was half full; I greased the edges of the pan; I scattered a little salt in it; then I set it over the fire. The fellows all crowded around me. When it was half baked I began to shake the flap-jack, so as it shouldn't settle down and not stick. Now, mister, comes a trick that no one but a man bred on the plains kin do. That's the tossing of the cake. I don't want to brag much, but there ain't a man that lives 'twixt the Rocky Mountains and the sea that can toss flap-jacks with me. Mebbe Carver can beat me shooting, but he ain't no shakes to me tossing flap-jacks. It's agin the hunter's code out on the plains to turn 'em with a fork. You just take your pan, steady your flap-jack for a moment, give her a jerk and up she flies in the air, and she lites plum on the other side. That lady kin give you the fixings what a flap-jack ought call for, the 'redients, but the flipping of a flap-jack in the air she can't show you. There was a kind of beam stretching across the shanty the party was housed in, and I just slung her over that cross-piece and cotched that flap-jack as she lit on the other side. They had never seen the trick before, and they just howled with delight, and eat up my flap-jack. I was a baking and tossing flap-jacks all night. I acted as guide for those fellows afterward, and a nicer lot of chaps I never met with. Now you know all about flap-jacks, except the slinging of 'em. Give me flap-jacks and beaver-tail and a good big three-pound hunk of elk, and I don't want anything better. Any fool can make up a flap-jack, but the slinging of it is the thing that tells."

[FROM A STAFF CORRESPONDENT.]

ROCKY MOUNTAIN WANDERINGS.

WHEN, in the course of human events, it becomes possible for the overworked business man or student to exchange for a time the desk for the open air recreation, which most men crave and which all need, the choice of a locality to visit and of the routes by which this is to be reached becomes a matter of no small importance. For many years it has been our custom to visit each summer some portion of the trans-Missouri region, either the Plains or the Rocky Mountains. We know of no locality in the East where so much pleasure or health may be secured in so short a time as in the stupendous mountains which form the back bone of this continent, and to all our readers we recommend at least one visit to this enchanting region. Among these towering, snow-clad peaks are thousands of lovely valleys, scarcely yet explored, where game is still abundant, and where delicious trout, weighing from one to four pounds, are to be had for the trouble of making a cast. Here there is room for all who are in search of rest and health, and here, year by year, greater increasing multitudes to rejoice in the charms which nature has scattered with so lavish a hand. Among the most delightful of these spots are the Parks of Colorado, to be reached via Union Pacific and Colorado Central railroads, and there the traveler, if an invalid or accompanied by ladies, can find conveniences in the shape of comfortable hotels, which may not come amiss when he arrives dusty and tired from his railway journey. Travel by rail in these latter days, however, is made so comfortable that the tourist has little to complain of, and when the palace cars are furnished with a bath room at one end for the use of the passengers, we fancy that the last grumbler will cease to murmur.

Some brief suggestions as to the mode of our summer's trip may be useful to others who propose similar excursions, and to this end we shall furnish, as the occasion offers, notes of our progress and adventures. We may premise that in our

various excursions in the past we have traveled over almost all the railroads between New York and Omaha, and that, after a somewhat mature weighing of their various advantages, we have decided that those to be hereinafter mentioned are the ones by which our journeyings in the future are to be made.

The excursionist whose business or pleasure calls him to the West should not fail to make at least one trip over the Pennsylvania Central Railroad. Having made one, he will be likely to repeat it. With us this road is a favorite one on account of its beautiful scenery, the comfortable accommodations which it furnishes, and the speed and safety with which it conducts the tourist to his destination. It was with a great feeling of rest and security that we stepped into the Pullman sleeper recently. We felt that now, for thirty-six hours at least, we need give no further thought to our journey. We would be well taken care of and in due time landed safely in Chicago. So, confiding our traps to the care of John, the porter, we devote an hour or two to surmises as to what the next few weeks may bring forth, and then retire in good time.

He who journeys by the Pennsylvania Central when going West, will not, if he be wise, devote to sleep the early morning hours. Some of the finest scenery on the road is passed before reaching Altoona, and from the rear platform of the train our delighted eyes beheld a superb and constantly changing panorama. From the moment of entering the Alleghenies the speed of the train slackens, and the patient engine puffs heavily up grades of remarkable steepness. The road winds around the sides of the wooded mountains, now and then striking a more or less level river valley which it follows for a short distance only to leave it before long and recommence its climb. On every side the hills covered with the fresh green foliage of deciduous trees, here and there interspersed with darker conifers, stretch away into the hazy distance, and far below in the valleys the tiny streams gleam bright and sparkle in the morning sun. Just beyond Altoona comes the rarest bit of all—the famous Horseshoe Curve. As we approach it we see high up on the mountain side, across the valley, the track over which we are soon to pass, and so steep is it that it seems incredible that our heavy train should surmount it. We are, however, entering a *cul de sac* from which there is no escape save around this point, and presently we see our own locomotive creeping along in the direction opposite to that which we are pursuing, and actually making the turn. So the Horseshoe is passed, a spot familiar, no doubt, to all our readers, and but for that deserving a more extended description. It must be seen to be appreciated.

The region through which we are passing is one of very great geological interest, and has been thoroughly and ably worked up by the State Geological Survey. Abounding as it does in coal and iron, we see everywhere signs of business activity and thriving industry. Furnaces are blazing and smoking; cars loaded with coal, ore, or manufactured iron fill all the sidings, and a general air of prosperity pervades each town or hamlet through which we pass. At two o'clock we reach the City of Smoke, Pittsburgh to wit, one of the most important railroad centres in the United States, and pressing onward, soon are in fertile Ohio, celebrated for her broad wheatfields and fat cattle as well as for her manufactures of iron and agricultural implements. Through these close shaven stubbles the quail are even now leading their tender broods, gleaming the abundant leavings of the farmers, and here, two months hence, superb sport will be enjoyed by many a reader of *FOREST AND STREAM*. Still we rush on, till at last night spreads her shadowy pinions o'er the earth and shuts out the charming landscape. Morning finds us in Indiana, and soon we reach Illinois, and at eight o'clock find ourselves in Chicago.

From here West our route lies over the Chicago and Northwestern Railroad. The lines controlled by this corporation extend over much of Illinois, Iowa, Michigan, Minnesota, and Wisconsin; and, besides being one of the trunk lines between the Atlantic and the Pacific, they traverse one of the richest grain and cattle countries of the United States. On every side we see extensive fields either fresh from the reaper and dotted with shocks of yellow wheat or green with waving standard of tasseled corn. Great pastures are full of fattening cattle, and in the older stubbles are many flocks of sheep and hundreds of sleek Berkshire hogs. The motto of the Northwestern Road is, we believe, "Speed, Safety and Comfort," and well does it perform all that is implied in this saying. The palace cars are all that could be desired and the attendance is excellent. Besides this, well cooked meals are neatly served on the hotel cars, thus doing away with one of the most annoying features of modern railway travel—the twenty minutes for dinner at the ordinary railroad eating-house. By the Chicago and Northwestern Road we are whirled along for twenty-four hours, reaching Omaha, Neb., on Sunday morning. Here we had the pleasure of meeting Mr. Thos. L. Kimball, Gen'l Passenger and Ticket Agent of the Union Pacific Railroad, over which our journey is to be continued, and to him we wish to express our appreciation of the courtesies extended to us.

Omaha, the eastern terminus of the U. P. R. R., has been called the M.ropolis of the Northwest. It is, indeed, a flourishing town, and is destined in the not distant future to be one of the most important cities of the Western country. Nine railroads centre here, and in 1877 there were received 2,000,000 bushels of grain and 95,500 head of cattle. There are extensive smelting works here which last year produced \$5,000,000 of bullion, and the total amount of gold and silver bullion and coin handled during 1877 was \$60,000,-

000. Omaha's position to-day among the cities of the United States it owes almost wholly to the U. P. R. R., which is the only road leading to the vast gold, silver and coal fields of the Rocky Mountains, and to the unequalled scenery of Colorado, Wyoming and Montana.

From Omaha we pass West along the Platte Valley. What a change has taken place here within our recollection! Where now we see on all sides fertile farms and comfortable houses, but a few years ago the buffalo roamed in great herds, rarely molested, save by the Indian. We pass many well recollected spots, and with the sight of each of them memory brings before our mind thoughts pleasant or sad. Here, years ago, we killed our first elk; there is the point from which we started with four thousand Pawnees to hunt buffalo on the Republican. Further on is where we struck the railroad after being pursued by a band of hostile Sioux, and still later we pass the bluffs, near which, in a slight difficulty with the noble red, we had a horse shot under us. Where once the buffalo blackened the plain, now great herds of cattle extend almost as far as the eye can reach, and settlements have been pushed out on all the streams of the State. Almost all the Government land on the line of the railroad has been taken up by immigrants, but the Union Pacific Co. has still large quantities, admirably located for farming, at very moderate prices—from \$2 to \$10 per acre. All this land is either on or very near the railroad, and includes some of the best farming country in Nebraska, so famous already for its grain, its cattle and its furs.

From various points on the U. P. R. R. the traveler can reach the gold mines of the Black Hills, the almost unexplored Big Horn region, the Yellowstone Park country, Colorado, with its wonderful mineral and agricultural wealth, and the distant regions of the Pacific slope. Over the Union Pacific, too, the hunter in search of large game will travel. Rapidly as the settlements have spread in the West of late years, there are still extensive ranges of plain and mountain country, where the antelope, deer, elk and mountain sheep afford superb sport. We are now in search of such a region, and our success shall be fully reported to the readers of *FOREST AND STREAM* AND ROD AND GUN. Yo.

Medicine Bow, Wyoming.

THE VICTIM OF THE SHARK.—We regret to announce the death of Charles Cates, who was bitten last week by a shark, a notice of which appeared in our issue of August 15. It seems that the poor boy died rather from nervous shock than from the direct effect of the wounds. While at the hospital he constantly struck out with arms and legs, as if in the act of swimming, and if any one appeared at the bedside he would call frantically for help. Occasionally he had lucid intervals, during which he knew and spoke with his father and mother. He sank rapidly on Tuesday, and died peacefully at a late hour that night. It may be worth while to repeat here some of the characteristics of the shark. It does not seem as if the visual powers of the shark were as marked as his sense of smelling and hearing. The power of touch is believed, however, to exist. For an acquaintance with his sense of touch we are indebted to the investigations of Jacobson. In the head and great pectoral fins he found an organ, tubular in form, united in a spheroidal cavity, in which might be traced a provision for the sense of touch. It is pretty generally stated that a shark first approaches and gently touches its prey before it turns over to seize and devour it, mouth downwards. It may then be said to touch first what it feeds upon.

INSTRUCTION BADLY WANTED.—*Nature*, time and time again, in urging the necessity of scientific studies, complains of ignorance in highly educated English circles on the simplest topics having to do with physics. Here is just a case in point. In the last *Spectator* there is a short paragraph as to the degree of comfort with which men can live at great heights. A Mr. Webber, writing to the London *Times*, states that in Thibet he lived for months at a height more than 15,000 feet above the level of the sea. "This travel he had crossed the Gurla Mandhata at a height of some 20,000 feet, measured by the 'thermometer!'" Just here the *Spectator* ventures to say, "Surely a misprint or a slip of the pen for the 'barometer.'" Now, the average American school-boy knows that elevations are quite accurately measured by means of boiling water, a thermometer noting the temperature at which the water boils. The higher up the mountain, atmospheric pressure being diminished, the quantity of heat requisite to put a fluid in a state of ebullition is lessened. It is the old story of the monks of St. Bernard who tried to boil potatoes at the Hospice. The potatoes did not cook, because water at that precise elevation will not heat as high as 212 degs unless confined. Sir Humphry Davy solved the problem by advising the good father "to bake 'em." Any ordinary book of physics gives a table of elevations, based on thermometrical measurements of boiling water. Barometric and thermometric measures are both used, however, to determine elevations. Nevertheless, the schoolmaster is wanted abroad.

CAPTAIN BOGARDUS.—Captain A. H. Bogardus arrived in New York last Tuesday. Having made more than good his title of "World's Champion," so far as rival English shots are concerned, the Captain returns laden down with trophies, gold and glory. His exploits have very thoroughly demonstrated that when it comes to an individual contest at the trap England must take her place after America. As the upholder of our good name and fame among the crack pigeon

shooters abroad, Captain Bogardus receives our congratulations upon the very satisfactory issue of his trip. Upon his arrival in New York the claimant to that title has again found that the way of the "Champion Wing Shot of the World" is hard. His laurels must be constantly defended, eternal vigilance against "all comers" is the price of a shooter's fame. Dr. W. F. Carver is out with any number of challenges to Bogardus to shoot at a mark, break glass balls by the hundred, the barrel or hour, and to shoot pigeons. Indeed, the rounds of challenges and rechallenges are quite lively. There may be some flame. There is certainly plenty of smoke.

HONORS WELL DESERVED.—Our much esteemed friend, Frederick Mather, Esq., has been made a corresponding member of the *Deutsche Fischerie Verein*. This is quite a compliment, and is fully merited.

THE GENTLEMEN OF ENGLAND AND AMERICA.—We call attention to the arrangement made by our correspondent Captain John M. Taylor and Captain Shelley, in regard to a team shooting at pigeons, to be held some time this year in the United States, between a certain number of English and American gentlemen. Any correspondence sent us on this subject, from gentlemen on our side desirous of competing in this match, must be addressed to the *FOREST AND STREAM*, and will not be made public without permission.

DRAFTS AND MONEY ORDERS.—All drafts, checks and postal money orders sent to us should be made payable to "The Forest and Stream Publishing Company." By observing this rule our subscribers and advertisers will save themselves and us much needless annoyance.

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

Society, Clark Pritchett, Nashville, Tenn.
Wisconsin State Sportsmen's Association.
Massachusetts State Sportsmen's Association, at call of President
Missouri State Sportsmen's Association.

SUCCESSFUL BREEDING OF THE MESSINA QUAIL.

EDITOR *FOREST AND STREAM*:

In answer to numberless inquiries in regard to migratory quail, and more particularly to the question whether the birds turned out here last year have returned to their breeding grounds, I can safely answer that it is now settled that they have returned, and that the birds of last year's importation have hatched their broods on the same grounds where they were bred last year, and their broods were fully two-thirds grown before any of those turned out this year had hatched or had had time to hatch. There are a number of nests by birds of this year's importation in the same vicinity, one containing seven eggs, two of eleven each, one of seventeen, and others where the number of eggs is uncertain, the old birds not having been driven off their nests for inspection. The egg makers have unwittingly destroyed three nests this year, each having eleven eggs. One of the birds was injured by the mowing machine; the others were either killed or left the place on account of the disturbance. The old lot of birds have scattered more widely than last year's, some of their nests having been seen twelve to fifteen miles from their locality of last year. The birds seem to be doing nearly or quite as well this year as last, but as they were received and turned out a week later this year than last, they are a week later in hatching, and one nest at least has been found containing but half the average number of eggs. The broods of the old stock were large enough on the 26th day of July to take very good care of themselves with the assistance of the old ones. When found in the meadows though in two cases at least young birds have been killed by the mowing machine, the same has once or twice happened to full grown birds. There have been imported into this country this year five thousand (5,000) birds. This, with the importations of 1877 and their increase, gives us a breeding stock of at least six thousand (6,000) birds. Besides the exportation of birds to this country from Messina, there were exported from that one port to London fifty thousand (50,000) birds, and to Paris forty thousand (40,000). This extraordinary demand nearly doubled the price at the port of shipment over that of last year. We, however, do not regret our outlay, believing the experiment to be fully successful, and that no club can make a mistake by investing a moderate sum in this enterprise. The birds will be safe in Vermont for some time to come, as no sportsman will molest them, and we have no pot hunter who can.

Butland, Vt., Aug. 10, 1878.

We consider such information as Mr. Everts gives us to be of the greatest value, and are led to suppose that the breeding of Messina quail is now an established fact. Great credit is due to the public spirited gentlemen and to the sportsmen's clubs who have spent their money to forward the acclimation of foreign game birds in our midst. We should be pleased to receive reports from other localities where the birds have been introduced.

ENGLISH WILD RABBITS.—A Canadian gentleman is desirous of obtaining some information in regard to any attempts which have been made in the United States or Canada to import and raise English wild rabbits. Will some of our numerous correspondents give us such facts as they may be acquainted with?

NOVA SCOTIA.—The Game and Inland Fishery Protection Society, of Nova Scotia, publish in pamphlet form the game and fish laws of the Province, together with a list of the commissioners and wardens. Gentlemen who propose visiting

Nova Scotia this fall will do well to supply themselves with this compendium, which may be obtained from A. E. Harrington, Esq., Halifax, N. S. The society is now four years old, and is doing a good work in fostering the native game. One especially noteworthy feature of its success is the renewed abundance of moose, which in 1874 were at the point of extinction.

PENNSYLVANIA.—At the regular annual meeting of the Franklin Sportsmen's Club and Game Protective Society, Aug. 13, the following officers were elected for the ensuing year: Pres., R. G. Lamberton; Vice-Pres., Alex. Vincent; Sec'y and Treas., J. B. Hicklin; Attorney, L. D. Rogers; Directors, L. W. Howe, J. S. Macy, Dr. J. R. Boreland, William Wenzell, W. H. Wallace. A resolution was passed requesting the farmers of the county and others to make known to the club any violations of the game and fish laws, with names of witnesses, and directing the attorney of the club to prosecute the same with vigor and without respect to persons.

—Greensburg sportsmen have joined the ranks and are to organize a sportsmen's club for the protection of game.

The Rifle.

MASSACHUSETTS—Worcester, Aug. 15.—First contest of Worcester Sportsmen's Club for a gold badge. Conditions, thirty shots each, distance 1,000 yards. The following are the scores:

S. Clark.....	3	4	0	3	4	5	4	5	5	4	5	4	6	0
A. L. Rice.....	2	5	4	2	5	4	4	3	4	5	4	5	4	130
A. G. Madsen.....	5	5	4	5	5	5	5	3	2	4	4	5	4	130

H. S. Pierce.....	91	43	96	40	187	83
Charles Hinds.....	88	40	88	40	176	80

BOSTON—Walnut Hill, Aug. 4.—Regular Wednesday competitions. The scores make the second half of the fourth competition for places upon the American team. Tuesday the members shot the first half, making J. G. Brown, 205; H. T. Rockwell, 200; W. Gerrish, 200; W. H. Jackson, 200; J. S. Sumner, 199; W. Davidson, 198. The aggregate of the two days is: W. H. Jackson, 410; Wm. Gerrish, 400; J. S. Sumner, 403; J. Brown, 403; W. Davidson, 395; H. T. Rockwell, 395. The second half of the second competition was shot yesterday:

Was shot yesterday.

weather. Our system of rifling is our own, not Henry's. Our bullet is slightly longer than Henry's, and is slightly fatter, so that it can never slip forward out of the cartridge. Balls are patched. A 12-gauge rifle has a twist of 1 in 30 inches, but also shoots a forced ball, which is also supposed to materially increase the resistance of the barrel. Charges for these calibres, as stated elsewhere, for 450-bore, 4 drachms powder, and 300-grain balls to 275; 400-bore 3 drachms powder and 300-grain ball, or proportion of powder to ball 1 to 2.44. A gentleman with much experience with the Express, and who owned one of Thomas Turner's (Birmingham) 450 cal. Express rifles, charged 4 drachms powder for 300-grain ball, or proportion of powder to ball, 1 to 2.5, twist 1 turn in 36 inches, writes as to trajectory: "At 25 yards, 2 inches high; at 50 yards 1 inch high; at 75 and 100 yards, dead level; 125 yards, 2 inches under; 150 yards, 3 inches under. This is using the same sight at all distances. The trajectories of these two rifles appear very similar, taking into account the difference in charges, that is, within 150 yards, with same sight, they will come within 5-inch bull's-eye. This is certainly a very flat trajectory, and indicates that a decided difference in the twist of the rifle has not made a corresponding difference in the trajectory."

Would so many of the British Express rifle-makers adopt such a sharp twist as 1 in 20 if the trajectory was thereby appreciably affected? The tendency of the rifle-makers of this country, as understood, is to increase twist for their sporting rifles. The Sharps Company have changed the twist from 1 in 23 inches to 1 in 20 inches. The long-range increased from 1 in 20 to 1 in 18 inches. Compare the published table of elevations for their mid-range, twist 1 in 20 inches, calibre .40, 30 inches in length barrel, proportion of powder to ball 1 to 4.7, with the table of elevation of their long-range, calibre .45, twist 1 in 18 inches, length of barrel 32 inches, proportion of powder to ball 1 to 5.5, and you will see, making allowance for difference of length of barrel, the long-range, with increased calibre, increased twist and smaller proportion of powder to ball has at least as flat trajectory as the mid-range up to 400 yards. These tables are approximately correct, but sufficiently so for purposes of comparison.

Now, I submit that these facts do not sustain "H. W. O." in his theory that a Sharp twist of the rifling, practically speaking, appreciably affects the trajectory of the projectile. I will now briefly add the result of some experiments of my own bearing on this point, with a rifle .44 calibre, 34-inch barrel, twist of rifle 1 turn in 20 inches. Powder and ball were carefully weighed, Vernier and wind-gauge sights used, and with a good rest; exactly the same sight was taken in each experiment at all intermediate distances. At the 100-yard and 75-yard firing points, where the greatest vertical deviations occurred, enough shots were fired to get a correct average, and vertical deviations were carefully measured, 100 grains of FG powder were used unless otherwise specified. The first experiment was with a 334 solid ball (the lightest to be had) sighted for a point-blank of 100 yards (two experiments), 24 shots expended gave a rise of 2 inches at 50 yards, 24 inches below at 125 yards, and 63 inches below at 150 yards. Up to 125 yards only 10 shots struck outside of a 4-inch ring, and sighted for a point-blank of 125 yards, the result of eight experiments, expending 91 shots (52 of which were fired at the 75-yard and 150-yard firing point), showed at 75 yard-point a rise of 3 1/2 inches above centre of bull's-eye, and at 150-yard-point a fall of 3 1/2 inches below centre of bull's-eye. Of 91 shots fired only 10 struck outside of a 7-inch ring, and every shot within a 10-inch ring.

A hand drill was then improvised and a 3-16 inch hole was bored into the point of the bullet 1/2 inch deep, and its weight reduced from 334 to 324 grains. The result of four experiments with this bullet, expending 41 shots, was that sighting for a point blank of 135 yards at all intermediate distances within 150 yards, every shot struck within a 5 1/2 inch ring except four. When the term "ring" is used, it refers more to vertical deviations. In many experiments strong winds were blowing, and the attention was given more to the vertical deviation. Had the same been given to gauging the wind and the lateral deviation had been equally as confined as the vertical, as the targeting was very fine in all experiments and the balls well bunched. Not being able to get a lighter patched ball, a 295 grain naked ball was then experimented with. On a cloudy, moist day this ball gave very uniform shooting, balls being closely bunched, though this rifle usually does not give uniform shooting with naked balls. Sighted for 200 yards, with 100 grains powder, the result of two experiments showed a rise at near 100 yards of 7 inches. Sighted for 125 yards, and using same sight at 150 yards, and all intermediate distances, several experiments showed the rifle would command a five inch bull's-eye. In one experiment, sighted for 125 yards, 13 consecutive shots were fired, 3 at 125-yard point, 5 at 100-yard, 3 at 75-yard, and 1 at 50-yard point, and every ball of the 13 actually struck within the 5-inch bull's eye (Dennis's target). Seven shots were then fired with same sight from 150-yard firing point, but targeting was not so good, only two striking within the bull's-eye and the other five being almost equally distributed above and below, the average of the deviation being within the bull's-eye. In another experiment, sighted for 125 yards, 4 shots were fired at 150-yard point, 3 at 100-yard point, and 3 at 75-yard point; the greatest vertical deviation was 4 1/2 inches, and had a mistake not been made in targeting, the result would have been the same. The above experiments are reliable and can be duplicated substantially at any time. The result of these experiments shows this rifle, with 100-384 grain charge (powder to ball in 3.84), will command a 7-inch bull's-eye within 150 yards, using the same sight; with 100-320 grain charge (1 to 3.2), it will command a 5 1/2 inch ring, and with 106-395 grain charge (1 to 3.76), a 5-inch ring, with careful sighting and shooting.

This comparison favours the results heretofore mentioned as given by Express rifles, and convinces me that this class of rifle, with rifles of such construction as will hold a light ball, with heavy charge, will give as flat trajectory as any rifle with proportionate charge of powder and ball. Now, Mr. Editor, my theory about all this business is this: I am aware that writers on ordnance rather favor the idea that increased twist tends to lighten the trajectory. Theoretically, and with heavy ordnance, this reasoning may be correct. Practically, and with small bore rifles, I believe it is not correct. A scientifically designed rifle is such that, with a given bore and length of barrel, the weight and quickness of powder and weight of ball should be so proportioned that the combustion and expansion of the gases is gradual and accumulative until the instant of the ball leaving the muzzle, when the full force of its expansive force, the charge is utilized to send the ball on its way, the resistance of the ball as it starts from the breech is of two kinds: first the weight of ball and resistance of the air, which is constant during its flight; second, the friction of ball in the bore and from the twist of rifles, which ceases at the

instant of its exit from muzzle. Now, if the combustion of powder is gradual, and the full expansive force of the gases is not fully developed until the moment of ball leaving the muzzle, it would seem reasonable that the friction within the bore does not affect the initial velocity of ball. It would seem reasonable, especially with large charges of powder and light ball, that a certain amount of retardation in the bore may be necessary (such as is caused by sharp twist in rifle, or using a forced ball) in order to insure perfect combustion and full development of gases generated; whereas this retardation would necessarily increase the recoil, it need not have any injurious effect on the initial velocity of the ball. At any rate, I maintain that as high velocity is developed in properly constructed rifles with very sharp twist as by those with twist considerably less sharp, and that, practically, flatness of the trajectory is dependent in a scientifically proportioned rifle entirely upon the relative proportions of powder and ball. The facts given above in this communication substantiate these views in my opinion. Did space permit I would have something to say in regard to H. W. O.'s standard rifle for large game, but will close by advancing the opinion that it will be some time before a rifle of his standard, with 40 grains powder, 20-inch barrel and 6 pounds weight, will be adopted west of the Mississippi River, where at present they vary in weight from 9 to 16 pounds, with charges of 70 to 100 grains powder, with a tendency to large charges. P.

July 20, 1878.

The Game of Chess.

Problem No. 24.

Tourney set, No. 19. Motto: Blue Hells of Scotland.

White to play and give mate in three moves.

Game No. 72—RUY LOPEZ.

The last game in the Paris tourney, by the gain of which Herr Zukertort, lost, scoring two, carried off the first prize:

Resigned.—Westminster Papers.

CURIOUS JOTTINGS.

Zukertort defeated Winawer in the tie match by a score of two games and two draws. Mr. Zukertort wins first prize and the title, "World's Champion."

Mr. Mackenzie won two successive games of Mr. Bird, thus securing the fourth prize.

Rational Pastimes.

ARCHERY CLUBS.

ON organizing an Archery Club, the first thing is to elect a President, Secretary and Treasurer, and, if the club is large, an Executive Committee. The latter should draw up a simple set of rules and by-laws. The bows, targets and other club property should be in charge of the member at whose house the meeting takes place, and by him delivered to the place of the next meeting. The scores should be kept by the respective captains, who alone should draw the arrows from the targets, and all arrows should be marked with the owner's name in full, to prevent mistakes.

Any member dropping an arrow while shooting shall have the right to pick it up and shoot it again, provided he can reach it with the bow without moving from the score.

All arrows striking between two hands shall count in the highest.

Each side, if possible, should have separate targets, and gentlemen should be handicapped one-fourth of the distance; that is, if they shoot eighty yards, ladies should shoot but sixty.

Ties should be decided by the greater number of hits. Arrows dropping, glancing or rebounding from the target do not score.

After shooting, arrows and bows should be wiped clean and rubbed well with a rag and a little oil and beeswax. If the string shows signs of wear, rewind or replace with a new one. Each archer should have a new bowstring from the quiver belt, and the arrows, when drawn from the ground, should be wiped therewith.

Bows should be hung up in a baize bow-bar or allowed to rest flat, or else they will be apt to warp. Arrows should also lie flat.

If the feathers are lost from the arrow, peel a side on a goose or turkey quill, cut the same length, and glue on then when dry; or trim to match the others. The arrow should be one or two cock feathers to show the side that should lie next to the bow.

In last week's *FOREST AND STREAM* there was a score between two clubs published, but it was impossible to judge of the shooting, as there was no way of telling how many arrows were fired or what the size of the targets were.

Clubs, in sending scores, should give the distance, number of ends (each end consists of three arrows), number of hits, score and size of target used.

The standard size, as mentioned in a previous number, is 48 inches, gold or bull's-eye 9 inches, and the distance for gentlemen 100 yards; ladies, 75. A 24-inch target, with a 4-inch gold, is considered about right for 40 yards.

The great trouble is that the mass of bows sold will not throw an arrow any distance. People are buying bows of both American and foreign make, costing from one to five dollars, but only for children, and, for those who will become dignified with archery from the use of such inferior material, it would be better for two or three to club together and get a good article than to use this cheap and worthless stuff.

I have a self-lancewood bow, now in daily use for over six months, and it is perfect. It is one of Aldred's, of London. It would be very valuable if archers would give, without prejudice, their experience of the different makers. Mr. Maurice Thompson claims that he cannot find a foreign bow that will stand his hard shooting, but also states he has not tried one of Aldred's. Time will tell, and I have yet to hear of one of them that disappointed its owner.

W. L. I., President Oriani Archers.

SCOTIA VS. ENIN.—The contest between Duncan C. Ross, the Scotch athlete, of Toronto, Canada, and Thomas Lynch, the Irish champion, of New York, came off at Jones' Woods, this city, last Thursday. The contest was preceded by a one-mile walk, won by D. McDonald 8m. 15s.; a half-mile race (for amateurs who had never won a race), also won by McDonald, against three competitors, in 2m. 30s.; Mr. McCaffrey won steeple jumping, and Mr. Lynch won the prize for the running broad jump. After these events, the contest had been decided the event of the day was announced, and Ross appeared on the sward. The first test was throwing a 60-pound stone from the side. In 24ft. 9in., 24ft. 10in., 24ft.; Lynch, 21ft. 6in., 23ft. 10in., 24ft. Three attempts at putting the same stone from the shoulder were won by Lynch, 24ft. 9in., 24ft. 10in., 24ft. 11in.; Ross, 20ft. 4in., 21ft. 4in., against 17ft. 10in., 19ft. 3in., 18ft. 5in.; for Ross, Ross outdistanced Lynch in throwing the 16-pound hammer, as follows: Ross, 80ft., 97ft. 2in., 96ft. 8in.; Lynch, 80ft., 101in., 98ft., 93ft. Ross won at throwing the 12-pound sledge as follows: Ross, 105ft. 2in., 107ft. 10in., 110ft.; Lynch, 101ft. 6in., 98ft. 9in., 107ft. Lynch put a 30-pound stone from the shoulder the following distances: 29ft. 4in., 31ft. 2in., 30ft., against 27ft. 7in., 28ft., 31ft. Ross won the 16-pound stone 40ft. 7in., 43ft. 4in., 43ft. 4in., to 36ft. 10in., 36ft. 4in., 38ft. 10in., for Ross. Lynch also won the standing broad jump, as follows: 9ft., 9ft. 10in., 9ft. 10in.; Ross scoring 9ft. 2in., 9ft. 5in., 9ft. 6in. He vanquished his opponent for the fifth time by jumping 4ft. 11in. (running high jump) and thus he secured "the championship of the world" and \$500.

O'LEARY.—He did, or he didn't. That's the way it stands now, and no one will ever know certainly whether the 400 miles in the Boston Music Hall were made in 123 hours or not. The timekeeper's account, after this, is to reckon the miles variously at nineteen, twenty and twenty-one laps, and while there is every reason to suppose that the pedestrian accomplished his feat, this peculiarity of the timekeeper has prevented the time from going on record.

"BATING THAT O'LEARY" AGAIN.—John Hughes, the pedestrian, who was puffed up by Harry Hill's money and good-natured paper notices last spring, has started out on another wild tramp. He was, at last accounts, dashing around in his Montgomery Ward, bent on making 400 miles in less time than O'Leary took to accomplish the feat.

AMATEUR SWIMMERS.—Last Saturday the second annual swim for gold, silver and bronze prizes, presented by the New York Athletic Club, was contested in the Harlem River. The entries were: H. M. Martin, Nonpareil Rowing Club; George Kegler, Elizabeth Turnverein; F. J. Hynes, New York Athletic Club; James Fraser, New York Athletic Club; T. E. Kitching, New York; John Bittner, New York; H. J. Heath, New York; G. W. Alcott, Brooklyn; and Dennis Butler, Brooklyn. Of these, all appeared to take part except Hynes. The start was made from Macomb's Dam at 5:30 P. M. The men swam with the tide. Butler got ahead at the start, Alcott took second place and Kitching was third, and the other five in perfect line for the first 200 yards. Butler throughout the race swam hand over hand, changing from left to right hand; the others swam squarely with face down. At the half-mile stake the positions were: Alcott first, Butler second, Heath third, Bittner fourth and Kitching fifth, the rest one hundred feet behind. At the mile stake the excellent finish was: Butler, winner, 20m. 5s.; Alcott second, 19m. 13s.; Heath third, 19m. 20s.; Kitching fourth, 19m. 25s.

CRICKET.—A match between the Staten Island Cricket Club and the first nine of the Staten Island Base Ball Club, at Washington, S. I., last Saturday, resulted in a score of 77 to 40 in favor of the former. The Australian cricketers have reason to be highly satisfied with their success in England. A writer in a recent English magazine foretells that the Australians are to be the coming man. The English players are beginning to think that he is the man already. American cricketers will shortly have an opportunity to try conclusions with the Australians. They leave England about September 10, and will play in New York, Boston, Canada, Philadelphia, Chicago, Detroit, St. Louis and San Francisco.

The return cricket match between the Manhattan Club, of this city, and the Paterson United Club, will be played at Prospect Park on Friday. The Paterson United will play the St. George's at Hoboken next week. The Germantown Club will play at Staten Island during this month.

NEWPORT ATHLETIC MEETING.—The entries for the games at Newport to-day number over one hundred, and comprise many athletes, who have made excellent records. A fine display of skill may be expected. To-morrow the Lacrosse tournament will be held.

WHOSE CARRIER PIGEON IS THIS?—Elizabeth, N. J., Aug. 19.—Mr. Editor: While on the salt meadows, last Friday, I saw a man shoot a carrier pigeon. Was it a bird flying in a match?

R. M. C.

Sportsmen's Goods.

SPECIAL NOTICE

TO
GENTLEMEN.

We have just received a direct importation of East India novelties, to which we desire to call attention:

- 1st. 25 pieces pure Corah Silk, a delicate fabric, of soft, creamy shade, which we sell by the piece.
- 2d. 25 pieces real Seersucker, which was made in narrow stripes expressly for us. We shall make suits to order, and keep in stock Sack Coats ready made during the month of August.
- 3d. Chogas.—A few of these fine embroidered Camels-Hair Smoking Jackets for gentlemen, such as we offered two seasons ago.
- 4th. 25 pieces Pure Pongee Silk. These silks, made into suits, we offer as the coolest and most attractive summer garments for gentlemen ever shown. Price only \$11 per suit.
- 5th. 50 sets of Pijamae and Cobias—or East India Sleeping Dresses. These were made to order in Canton, and are very handsome and desirable, at same time inexpensive. Last season we sold the suits at \$15. This month we offer them at \$9.
- 6th. 50 pieces genuine old fashioned Nankeen. This we sell by the piece or make to order into suits for gentlemen or children.
- 7th. A few dozen East Indian Silk Sashes, to be worn with Children's Summer Suits. These are very fine in quality, but very cheap. Price \$2.

For Forest and Stream and Not and Gun, Bower and Gardener Birds.

(Abridged from the Italian of Dr. O. Beccari.)

By T. M. BREWER.

THE brilliant colors of birds, their elegant forms and their songs, exert a potent fascination and stimulate us, almost involuntarily, to a careful observation and study of these peculiar forms of animal life. At the same time their interesting habits, with the constant evidences of a superior intelligence, inspires us with wonder. Who has not admired the studied care, the patience and the ingenuity they display in the creation of their nests? Need I mention such constructions as those of the weavers, the republicans, the builders of pensile nests, the humming-bird, and many others? In all these there is made manifest a necessity that incites it to build a nest; the care taken to render the abode for its children commodious, capacious, sheltered from rain and other exposures, and inaccessible or concealed from the notice of its enemies.

It is now, moreover, well known that there is one entire group of birds who are not content with a simple nest in which to deposit their eggs and rear their young, or with making use of the same as a mere place of residence. In this group we find luxury, refinement, and æsthetic tastes so far combined as to induce its members to construct special places for their retreat, which they, from time to time, embellish and adorn according to their fancy, and in which they indulge in pleasures and follies of various kinds. It is to the family of Birds of Paradise that these winged Sybarites belong. They are species belonging to the genera *Ohamydodera*, *Ptilonorchus*, *Serialeus* and *Amblyornis*, and inhabit exclusively Australia and New Guinea.

At present the structures of the *Ohamydodera* are the best known. The English call them playing-places, halls, play-houses, but most commonly bowers, but which we of Italy would regard as best indicated by such terms as arbors, galleries or cabins. The birds which construct them are generally known as bower birds. So extraordinary did these structures at first appear that nobody seemed to have deemed it possible that they could be the work of any animal, and they were presumed to be rude cradles made by the natives for their infant children. It was afterward ascertained that they could not be nests, as these are made by the *Ohamydodera* after the manner of other birds, among the branches of trees, in form and size not unlike those of the common Jay. The *Ch. nuchalis* is a bird not much larger than the European mistle thrush, of plain brown colors—not handsome, but with a beautiful rose-colored spot on the back of its neck. Its arbor has the form of a straight gallery, is made of sticks fastened in the ground and arranged so as to meet at the top, and thus create a roof after the manner of the most primitive cabins. The ground all around is strewn with shells. The bird has been seen frequently to take up a shell in its beak and to carry it through the gallery, taking it now from one place and now from another. In like manner the galleries of the *Ch. maculata* are made of twigs, but are also beautifully lined with tall grass, so disposed as to meet at the top. The decorations are abundant and consist of bivalve shells, crania of small animals, and other bones, whitened by long exposure to the solar rays. According to the accounts given by various observers, these shells must have been transported quite a long distance, as the nearest streams from which they could have been collected are often quite remote. It has also been stated that many individuals of this species meet in the middle of these galleries to pay their court to the females, and that the same galleries are resorted to year after year. The *Ch. guttata* likewise constructs its galleries with straight lines, while all around on the ground are found the stones of fruit worn by the action of the sea, which is at such a distance that their transportation must have required a great deal of painstaking on the part of these birds.

The galleries of the *Ch. Cerviniventris* differ from those of all the others in having walls that are much thicker and more upright, though occasionally slightly inclined one toward the other at the summit, and consequently the inner passage is quite narrow. This is constructed of straws fastened into a platform of twigs filled with loose earth. It is about 1.20 metres in length, but not quite so broad. Here and there, by way of decoration, are strewn berries, shells of snails and sea-shells. One gallery was found to be 1.23 metres in length, with a height of .46, with a number of fresh berries scattered over it.

Other birds belonging to the genus *Ptilonorchus* construct galleries that display an equal degree of ingenuity. The satin bower-bird, *P. violaceus*, makes a gallery similar to that of the *Ohamydodera*, and decorates it with objects of bright

colors such as it can collect—namely, brilliant feathers of birds, bleached bones, land shells, etc. Some of the feathers are thickly intermingled with the straws, while the other ornaments—the bones and the shells—are scattered about near the entrance of these structures. The disposition which this bird manifests to appropriate for itself every attractive object it meets with is so great that the natives search their galleries in quest of articles they may have lost. Stone hatchets are said to have been found in them, as well as fragments of blue cotton cloth, probably picked up from some encampment of the natives.

It may here be remarked that the instinct that prompts its members to collect bright, shining objects, so common a peculiarity of the crow family, and one so well known, indicates their hardly doubtful relationship to the birds of Paradise. Can it be that here by chance we find indicated by these habits well marked evidences of an inherited moral character, indicating traces of a common origin in the long distance? Then, too, there is the regent-bird, *Serialeus melinus*, which also builds for itself a gallery, in which it amuses itself and meets its lady-love, but these are described as having little or no ornament. Count Salvadori is of the opinion that the *Xantolus aureus* will also be found to construct similar places of retreat, and I was informed when in Papua that it builds a nest on the ground. It may be that this so-called nest really refers to a gallery similar to that of allied species.

These constructions are spoken of as the most marvelous instances that have ever been discovered of the architecture of birds. But how insignificant are they in comparison with those of the *Amblyornis inornata*, which I am about to describe.

I have thus passed carefully in review all that is known of all the most remarkable achievements of other species, that we may be able all the better to appreciate the genius of this wonderful creature, which, under so modest an exterior, conceals the best developed intellect of any member of the entire class of birds.

And when we consider that the family to which the *Amblyornis* belongs, as do all that construct galleries, the birds of paradise, and that this family combines with species possessing the greatest elegance of plumage, others that manifest the greatest development of intellect, we seem justified in regarding it as the most perfect representative of the entire class. It is noteworthy that among the birds of Paradise those that are adorned with beautiful feathers do not construct bowers. This is a gift exclusively to those members of this family that have the most modest plumage, and it would seem as if the intelligent mind of these led them, in their endeavors to distinguish themselves, to pursue a different course from those that combine in their own person so high a grade of physical beauty.

The *Amblyornis inornata*, which I propose to call the gardener, is a bird about the size of our mistle thrush. Its specific name well characterizes its unattractive appearance. It is entirely destitute of ornament, and is probably, of all its family, the most wanting in bright colors. It is almost wholly of an obscure shade of brown, with a rufous tinge, and there is no appreciable difference between the sexes. It was found several years since by the hunters of Count Rosenberg, but the first notices of its constructing, which were spoken of as nests, were given me by the hunters of Signor Brulhi. These had made an attempt to transport one entire to Jernatu, but were unsuccessful, on account of its great size and the difficulties of the road.

On the 20th of June, 1875, I had the very great good fortune to be able to examine one in the remote mountain recesses where it had been constructed. It was on the fifth day after we had left Andai, going direct to Hatam, on Mt. Arfak. I had been compelled to remain a whole day at Wardendi, in order that my carriers might rest. And on this day I was accompanied by only five men, as I had been obliged to leave behind me several of my hunters, down with the fever, and my other carriers did not consider themselves sufficiently rested.

I had left early in the morning; it was already an hour past noon, and we were still moving on in a very fatiguing course. We had allowed ourselves no rest, because we had but a short distance to go before we would reach Hatam, our journey's end.

We were passing over the slope of one of the foot-hills of Mt. Arfak; the virgin forest was lofty and lonely, hardly penetrated by a single ray of the sun; the ground was free of underbrush; a well-trodden path showed that dwellings could not be far distant. We had just passed a small spring, from which it was evident the natives often came to draw water. At every step I met with objects never seen by me before; a species of *Balanophora*, growing after the manner of the peculiar knobs of the orange-tree, were on the ground all about me, like so many fungi; elegant palms and strange forms of plants attracted my notice. My attention was continually distracted by the songs and cries of birds that I knew must be unknown and undescribed, as always happens when we venture into a region for the first time and never before explored. Every movement of the leaves seemed to anticipate some new discovery; nor was it mere anticipation, for almost every discharge of my gun brought with it some new surprise. The birds we met with were for the most part not only different from those of the plains, but were very often wholly new to me.

I had just shot a small marsupial as it was clinging in the manner of a squirrel the bare and upright trunk of a large

tree, when, turning suddenly round, I found myself in close proximity to the path directly in front of a piece of workmanship more exquisitely lovely than the ingenuity of any animal had ever before been deemed capable of constructing. It was a miniature cabin in the midst of a miniature meadow, decked with flowers. I recognized at once the famous "nests" that I had described to me by the hunters of Brulju, but which I had always supposed must be made for another purpose than that of a nest, although I was at that time in total ignorance of the constructions of the *Ohamydodera*. I contented myself with a momentary and very superficial examination of this marvel, enjoining upon my hunters not to disturb it. But all my experience in Papua has since convinced me that these directions were unnecessary. Although directly on their path, this cabin had remained untouched, showing in what a friendly and peaceful estimation its inhabitants had been regarded, until their evil star had brought me to disturb them in their quiet and peaceful abode. We were then at an elevation of about 4,800 feet. After a half-hour's steep ascent we reached our place of destination.

During the first few days, the putting of my house in order and the urgent and necessary labor in the preservation of the vast collection of new and precious specimens that had been accumulating day after day on my hands, prevented my immediate return in order to re-visit the cabin of the *Amblyornis*, and in the meanwhile many others had been found by my hunters, who in a short time succeeded in procuring a number of specimens of their builders. I was, in truth, very reluctant to take the lives of these industrious little birds, and I had hardly allowed myself a sufficient number of specimens before I renewed my directions to my hunters to spare them and to respect their dwellings. The first cabin that I began to investigate was one nearest to my residence, toward which, at last, early on one morning, my crayon in hand and with my box of colors and my gun, which I gave to an Arfak to carry for me, I set out on my visit to the habitation of the *Amblyornis*. On my way I provided for my breakfast by shooting a pair of fat doves, *Carpophaga chalconota*, which, after the manner of its family, were feeding on fruit in the upper branches of a tall tree, where they would have been unnoticed had not their moving from branch to branch and their throwing down the fruit betrayed their retreat.

Reaching at last the cabin I immediately set myself to the task of sketching it, which sketch I have since endeavored to faithfully reproduce. At the moment of my visit the proprietors of this abode were not at home. I could not well spare the time that would be necessary to enable me to thoroughly observe them. My hunters had been able to surprise the birds both in the act of entering into and of leaving their cabin. In order to secure specimens taken in these movements they waited for them to appear about their huts, so that there is no room for supposing that any other bird would have been their architects. I could not ascertain with certainty whether any one cabin was frequented by a single pair or by more, or whether by more males than females, or the reverse; whether the males alone construct it, or if the females aid in the work; or whether they are made by the joint labors of several individuals. I have, however, no doubt that these cabins are used for more than a single season, from the fact that the birds are continually repairing and re-embellishing them.

The *Amblyornis* selects a spot on a level with the plain, and in the centre of which is a small shrub about the size of a walking-stick, around the base of which it constructs a cone, a span in diameter, of mosses. This is a support to the central pillar, upon which the covering of the whole edifice is supported. The height of this central support is less than that of the cabin, which is at least half a metre. All around from the top of this pillar, diverging outward therefrom, arranged in an inclined position and in a perfectly methodical manner, are placed long stems. The upper ends of these are supported on the apex of the pillar, the lower being inserted in the ground, and thus all around, except in front. In this way they create a conical cabin, exactly regular in the shape the whole presents when the building is completed. Many other stems are interwoven with it in various ways, rendering the base strong and impervious. Between the central supporting pillar and the circle where the stems are inserted in the ground there is left a circular gallery in the shape of a horse-shoe. The entire structure has a diameter of about a metre.

The stems made use of by the *Amblyornis* were the slender and upright forms of a species of orchid, *Dendrobium*, an epiphytal plant which grows in large tufts on mossy branches of tall trees. It is as slender as small straws, about half a metre in length. There are all living, and have adhering to them their small and complete leaves, and this plant is evidently selected to avoid the decay or dilapidation of their edifice; for these stems continue to maintain their life a long while, as indeed do most of the epiphytal orchids of the tropics.

The æsthetic tastes of our gardener are not restricted to the construction of a cabin. The appreciation of the beautiful in the *Amblyornis* corresponds to a remarkable degree with that we witness among man; thus which is pleasing to them is usually pleasing to us. A taste for beautiful flowers and for gardens with us are indications of cultivation and refinement. It seems strange, with such an example set them by this bird, that the natives of Arfak should manifest so little taste or decency in their own dwellings.

But now let us see how the gardens of the *Amblyornis* are

In the beginning I mentioned it as my belief that the design which both the true birds of Paradise and the *Amblygrammus* with their allied species, propose, the one in decorating themselves, the other in the construction of cabins and gardens was simply reference to the gratifications and attractions of the females. I maintain that this sentiment alone, favored by the aid of natural selection, is not enough to create the colors that develop the ability to make constructions on the part of the other. And it seems to me that by no means too extravagant a supposition, that the existence among birds of so lively a taste for the beautiful and so strong a desire to possess it, as to develop in the true bird of paradise changes of color in different parts of its plumage susceptible of variation, and such modification of their plumage as to give permanent satisfaction, and also to develop in the *Amblygrammus* and other birds the various answers of observation, by means of which simple primitive instincts have developed into future deeds, creating in them certain powers of reason, and thus rendering possible the creation of products that do not originate in instinct alone.

Fish Culture.

EEL CULTURE.

IF there is any one spot for the student of the eel question it is the pond of Mr. James N. Wells, of Country Road, Riverhead, N. Y. The pond covers some five acres, and here in the fall of 1876 were planted 24,000 eels, which were from eight inches to a foot in length, too small to skin for market. In 1877 the eels were fed with fifty bushels of clams and 2,000 horsefeed. They were not fed after July. This spring Mr. Wells began to feed them in May, and writes us that the last meal for the present season was given to them Saturday, Aug. 10. Mr. Wells takes a wagon-load of horsefeed and drives to the pond. He makes a noise by beating on the wagon, and the eels come rubbing in swarms from every direction, making the water black. He will hold a horsefoot in the water and dozens of eels will cling to it, even when lifted out of the water. He says that when he goes to the pond, except to feed them, he seldom sees an eel. Occasionally one will put out a head and look around, but seeing it is not feeding time will quietly disappear. He has fed out about 6,000 horsefeed this season which he buys of Capt. William Downs. On the 15th of April Capt. Downs set a horsefoot pound at the mouth of the river—or rather a trap of his own invention. After a storm when the trap has not been visited for two or three days as many as 1,000 have been taken out at a time. Whether the demand created the supply, or the supply the demand, we cannot tell, but at present the supply is rather ahead. Capt. Downs has kept a record of the number caught from the 15th of April to the 15th of June, and it footed up about 10,000. This footing of the eels is a source of much entertainment to visitors, who come from all parts of the country to witness the strange proceeding. The number of eels is estimated in the terms most impressive to each: "wagon loads," "stacks," "thousands" and "millions." Mr. Wells writes:

I do not know about their spawning. There are other fish, pickrel, pumpkin seeds and yellow perch, who may catch a spawn. My eels are fed and will not be sent to a forty-one cent per cent under the water and all that can get their heads into it will do so. You may catch them with your hands (if you can hold them). They have grown this summer some from twelve to a pound to six pounds per dozen, dressed. They gain very fast while feeding. Now they are very fat. They will eat 250 horsefeed or 15 bushels of soft clams in a night. The next day they will not be sent to a forty-one cent per cent under the water. The pond is a clear sand bottom, excepting about two acres in the middle of mud from one to five feet deep, water, some five or six feet in the middle. Whole pond covers about five to seven acres. The margin is sandy all around. It is a spring bottom pond. I put twenty-three small eels in the pond twelve years ago. In three or four years they weighed from two to half a dozen pounds each, which was the cause of my trying this experiment.

Riverhead, N. Y., Aug. 14, 1878. J. N. WELLS.

THE FISH SHOW AT THE CHICAGO STATE AGRICULTURAL FAIR.—This will be one of the most attractive features of the fair next September 3 to 18. Mr. Welcher, Superintendent of the Michigan State Hatching House, is supervising the arrangements. The show was primarily designed as an exhibition of artificially raised fish, to indicate what has been accomplished by fish culturists since their initial efforts in 1867-8; but specimens of all fresh water fish are desired for the aquaria, and we have no doubt that some interesting specimens will be shown. Dr. Estes is making an effort to obtain some striped bass and other specimens which have attracted much interest of late. The striped bass (*R. chrysops*), as described in "Hallock's Gazetteer," very nearly resemble the *R. lineatus* of the salt water, though somewhat differently marked. Their specific characteristics scarcely differ. They are found in the Mississippi River and many of its tributaries, penetrating several of the Southwestern States. Mr. Hallock has promised specimens, drawings and formula of them, by which he will be enabled to make comparisons with the salt water striped bass and rock-fish of the Atlantic coast. The tanks will occupy a large space of the Chicago Exposition building, and we have no doubt that, with the whole of Lake Michigan at their back and beach, they will enjoy a more abundant supply of fresh water than was allowed to them at the Centennial Exposition. The exhibition building stands beside the lake, and the advantages for a first-class show are very great. This paper regrets that Superintendent Welcher had not communicated with the FOREST AND STREAM earlier, for we feel that we could have rendered material service in extending the collection of fish. It is a matter of satisfaction that Mr. Reynolds, the general superintendent of the fair, has taken so much personal interest in the fish show, and given all possible effort to make it a success.

FROM A TADPOLE TO A FROG.—Editor Forest and Stream: I intend to tell your readers in a very simple and childlike manner how I am the possessor of a "green-headed bull frog" raised from a tadpole. Three years ago, after spending some two days on the Beaverkill, I started from Morrison Station, a drive of some thirteen miles, for New York, having with me a wide-mouthed bottle containing nineteen newts and two tadpoles (the latter just commencing to change their state to frogs), taken from the pond back of Murdoch's the day before. Reaching Morrison Station, I bought a two-quart tin pail, and had the cover perforated with holes. I emptied the bottle and found one tadpole and one newt dead, placed the eighteen newts and one tadpole in the pail, having with me a tin of horsefeed, and found all in the best of condition for N. Y. On arrival here I put them in a small aquarium, 9x14 inches, filled, of course, with croton and layer of house sand at the bottom, with a few shells and piece of coral. Of the newts I have given away fourteen, and have now four newts and a green-headed frog measuring about five inches from the end of the snout to the hinder pharynx, being the result of

the one tadpole. For the first two years I fed the frog with croton bugs (after he had arrived at a frog's estate), with which my house at that time was overrun, but having at last gotten rid of these bugs, for the past year his diet has been flies, (with an occasional stray bug), especially so this summer. During the winter, although in a room heated sufficiently for the genus house, he had nothing to eat for weeks, as the croton bugs were *non est* and there were no flies. Then at times I tried him with small pieces of raw meat; he would take them readily, but invariably as soon as his mouth closed over them one of his front paws (I can call them nothing else) would wipe the meat out before you could say "Jack Robin so." Why this? Is it because their food in a wild state is wholly insect? Using now one of the new balloon traps he has plenty of flies, which he takes readily from off my fingers—one to twenty at a time. No matter how many he has the "green-headed monster" is never satisfied, and is always ready for more. The tadpole when put into the Aquarium was about two and one-half inches in size and taking into consideration the change of the water from that of a trout pond to the Beaverkill is that of croton in a small aquarium in the month of July, my success was wonderful. I intend pushing the experiment to a greater degree when an opportunity offers.

As regards newts it seems that the more I starve them the better they like it. I feed them once or twice a week with small pieces of raw meat from the end of a broom straw, and also put live flies on top of the water which they take readily; but they will not go near a dead one. I was in hopes to have had some offspring from the newts, as I had both male and female, but I presume the frequent changing of water necessary in a small aquarium is fatal to such a realization.

RANA PIPREUS.

GERMANY.—The German Society for Catching, Breeding and Preserving Fish, the Deutsche Fischerie Verein, are preparing an international exhibition at Berlin for 1889.

Natural History.

BLACK-TAIL DEER AND MULE-TAIL DEER.

IN the FOREST AND STREAM of August 8, we took exception to some criticisms which appeared in the *Atlantic* of July in regard to the Black-tail deer, in which Judge Caton's very thorough book on the "Cervidae" was questioned. We stated that misconceptions arose from the fact that there were two distinct species of deer, each called by the same name. In the September number of *Scribner's Monthly*, just at hand, will be found a capital article, both as to text and illustration, due to Mr. J. Harrison Mills, which is a valuable contribution to the history of the mule-deer in Colorado. Mr. Mills says: "The mule-deer does not bear an undisputed name. I knew him first as the black-tail, as he is almost universally called here. A recent issue of the *Rocky Mountain News* contains an indignant protest from one of our hunters against the liberty 'Eastern' naturalists have taken in rechristening, as he supposes, this animal." Mr. Mills gives a very lucid description of the mule-deer. We are indebted to Judge Caton for a letter on the subject of black-tail and the mule-deer, which, from such a leading authority, should, we suppose, for once and at all times settle this somewhat mixed subject.

I notice in the FOREST AND STREAM and ROD AND GUN of the 8th instant your criticism upon the critic who, in the August number of the *Atlantic Monthly* criticizes the review in that journal of my book, "The Antelope and Deer of America." You have given the true explanation of the manner in which the Club contributor has fallen into a great error when he supposed he was correcting an error. Had he perused the book, at least with any degree of care, he would have observed that in my very first paragraph of "General Remarks" on the mule-deer (*O. macrotis*), p. 94, he would have read, "In the Rocky Mountain region, where the true black-tailed deer is not found, it is still known among hunters and settlers as the black-tailed deer." On p. 375 he should have noticed the following quotation from a letter written me by Lieut. W. L. Carpenter, U. S. A., who is a careful observer, with a very extensive experience of the Rocky Mountain region, from Montana to Arizona, and an ardent hunter too: "I have never heard of any other deer in the Rocky Mountain region than the elk (*O. canadensis*), the black-tailed deer (*O. macrotis*), and the white-tailed deer (*O. leucurus*)." Here we see Lieut. Carpenter following the common nomenclature in that region, calling the mule-deer "black-tailed deer," but he leaves us no room to mistake his meaning, for he adds, the true scientific name, *O. macrotis*. This club contributor is not alone in error on this subject, for the revenue of the P. O. Department has been considerably augmented by the postage on letters to me from army officers and others of very extensive hunting experience in the Rocky Mountains, assuring me positively that the true black-tailed deer is there found as distinct from the mule-deer, and this is going much further than the Club contributor has gone; but have investigated no case where the black-tailed deer did not prove a *Macrotis* with a white tail, terminating with a black tuft, and naked on the underside, which is not observed with any other species of deer.

General J. W. Forsyth, late of General Sheridan's staff, would not be convinced by me that the true black-tailed deer was not abundant in the Rocky Mountains, but Gen. Crook was more successful. He was in the Sandwich Islands last winter, *O. macrotis*, or the mule deer, in more or less abundance, occupy the entire habitat of the true black-tailed deer (*O. columbianus*), but in some parts of it is very scarce, as in the coast-range north of San Francisco, while in Southern California they are the prevailing species. While this is a true *Macrotis*, it is a very distinct variety (*O. macrotis var. californicus*), which I first described about two years since in the *American Naturalist*. The most distinguishing characteristic of this variety is a dark line down the upper side of the tail from its base till it unites with the terminal black tuft, while on the Rocky Mountain variety the tail is white on the upper side all the way above the black tuft. On both, the tails are shaped alike, and are naked on the underside, and both have the enormous metatarsal gland, which is more than four times as

large as it is on the Columbia black-tailed deer, which is next in size, and more than four times as large as it is on the common deer.

I have no doubt it will be a long time before many very intelligent gentlemen who have never seen a Columbia deer, will be convinced that it is not found in the Rocky Mountains. Probably General Forsyth, when he gets through with the book he now has in hand, leading his regiment of cavalry against the Bannocks, will make himself as familiar with the true black-tailed deer as he has long been with the mule-deer under the name of the black-tailed deer in the Rocky Mountains, and then I think you may safely refer to him as authority on the subject, and I have no fears that he will vindicate my assertions in "The Antelope and Deer of America," that the true black-tailed deer, or *O. columbianus*, is not in the Rocky Mountains. J. D. CATON.

Oltawa, Ill., August 17, 1878.

AUSTRALIAN BOWER BIRD.—Some little time since we published in FOREST AND STREAM, in an article entitled "Architect and Gardener," a brief account of the wonderful *Amphiporus*, whose habits have recently been brought to the notice of the scientific world by Dr. Beccari. We have now the pleasure of laying before our readers a very concise but complete abridgement of the explorer's paper, which has been furnished us through the kindness of the eminent ornithologist, Dr. T. M. Brewer. Facts about birds and their habits are interesting to a very large class of our readers, and we have no doubt that the present charming paper will be fully appreciated by them.

CARIBOU IN CAPTIVITY.—Danville Junction, Me., Aug. 24.—Editor Forest and Stream: I gave you an account last summer of the capture of a cow caribou over on the north shore of the Gulf of St. Lawrence in the deep snows of March, 1876, and of her dropping a buck calf while in captivity in June following, and that I afterward obtained the pair and transferred them to my miniature park here. They became very tame, the young buck keeping very fat, but the cow thin in flesh. On the 4th of last April I left home, and was about four months returning, the first of the present month. I at once saw that the cow was at her last legs—looking like a walking skeleton—and it proved so, as she died in a week from that time. It seems she had never weaned the calf, the fat, lazy cub, about as large and heavier than his mother, and my man in charge not thinking to part them. I, of course, separated them at once; but too late to save the cow. The calf was almost frantic with grief at the death of his mother, whining about the park through several weeks with a quick, nervous gait, making at times a mournful bleat, although he had my herd of deer for company, as usual. He eats almost anything offered him in the vegetable or grain line. Of course I don't allow him dry corn. He is very fond of a moss that I procure in the forest for him, and many kinds of green boughs from the forest trees; feeds grass pretty well, but not so freely as the deer. They require a damp, muddy spot in which they can stand, or walk through a morning of rain, their feet, as they cannot be continually dry without becoming diseased. The caribou is now partially "halter broke," and I intend having him broken to harness this fall. His horns have got a splendid growth this summer, and are now in velvet. I am having a curious experiment with a spruce partridge in captivity, of which I will tell you soon.

M. W. CLARK.

THE AUDUBON FAMILY.—The following letter from a member of the family of the celebrated ornithologist appears in the New York Times of August 26:

Allow the family of the late John James Audubon, the ornithologist, to contradict some of the assertions which lately appeared in an article copied by you from the Hendersons (Ky.) Reporter. Mr. Audubon's wife, whose name was in error stated, was Lucy Howell, an English lady, whose family, at the time of her marriage, resided near Philadelphia; nor did she see Louisville till years afterward. She was essentially feminine in her pursuits, and could never have attracted the attention of the public by her powers of swimming, as she was wholly unacquainted with the art. Mr. Audubon's proudest boast was that he was an American, having been born in Louisiana, though of French parentage. He never kept a grocery store, though he was part owner of a mill. The statement we wish most decidedly to contradict is the cruel charge of jealousy of, and consequent separation from, his wife. With a devotion uncommon even among women, she left her husband, and, taking her children with her, taught, and thereby supported herself and them for years, that he might be free to carry on his life work. More than this: when, discouraged and disheartened, he returned to her from his wanderings penniless, she supplied him with the means to continue those researches and studies, which resulted in a success, due as much to her wisely devotedness as to his genius and endurance. From time to time articles relating to the private life of our grandparent appear in different periodicals and papers. While we appreciate and are grateful for the interest manifested in these so justly worthy of remembrance, we strongly urge upon the writers of such articles to send forth nothing to the public which will give a false coloring to lives which are fully able to bear the closest scrutiny throughout their entire career.

Washington Heights, Aug. 23, 1878.

A SEA LION IN DELAWARE BAY.—We take the following from the *Deer Sentinel* of August 24: "A sea lion was captured at Haverin's Beach, about one mile north of Sand Ditch, on Wednesday last, by Mr. Martin Knight. As the tide was out at the time, it could not make very fast headway. Mr. Knight called to some men who were upon the marsh to assist him, they surrounded the monster and immediately it showed fight. Mr. Knight struck it upon the head and stunned it, and they then pulled it upon the shore. The lion is about 54 feet long and weighs about 300 pounds. Mr. William Haverin has it at his house in a large tank. This is the second one ever taken upon this shore. One was captured several years ago at Bowers' Beach, but was killed before being taken.

DEATH OF THE WHITE ELEPHANT.—His Animal Highness, He of Sham, who weighed several tons is no more! He flopped his ears, twisted his trunk, and kicked his tail for the last time on the 23d of June last, and was floated to his grave on

MASSABESIC YACHT CLUB.—This is the title of a new yacht club formed at Manchester, N. H. They held their first annual regatta on Massabesic Lake, near the city, Aug. 1. The race was over a five mile course, won by the *Nautilus* in 57m. 26s. Judges, A. B. Fairbank, Frank Mitchell and L.

N. Aldrich. The other yachts in the race were *Susan*, *Lottie*, *Olydie*, *Ida* and *Madcap*. Prize, a silk flag.

CRUISE OF THE ENTERPRISE.—Commodore Peabody has tripped his anchor for a cruise to Mount Desert in his cutter *Enterprise*. Will be gone several weeks. She was built by Lawlor, of Boston, and has his style of section, quick turn to the floors at the garboard and at the bilge, giving a very powerful, but, we think, abhorrent midship section. Her garboards had to be hewn out of the solid log on account of their quick turn.

CAN THESE THINGS BE?—From a reliable source we are informed that after all the Shoe-wae-cae-mettes, of Monroe, Mich., hold a questionable status as amateurs. We are told by parties acquainted with them that they are "punters"—have paddled sportsmen after ducks for pay. One of them is known to have mixed drinks behind a bar for a gentleman; and, what is much more serious, our informant states that he knows beyond doubt that they sold their friends last year in the single scull race at Detroit. Their conduct in other races is also questioned. If these charges have any foundation to them, a close scrutiny of their status as amateurs should be made by the N. A. A. O. While we do not pretend to take sides on these imputations, we must regard them as of a serious nature, for they come to us from parties prepared to substantiate them.

CANOEING AT ROCHESTER, N. Y.—A correspondent writes us that the neighborhood of Rochester, N. Y., affords many fine rivers and ponds for canoeing, and that next season the sport will probably be taken hold of by gentlemen in that vicinity. Practical articles bearing on the sport will appear in our columns during winter, when many beginners can obtain the instructions necessary.

MARINE PAINTING.—"J. L. K." on "Marine Painting," in your issue of Aug. 15, has hit the nail squarely.

MARINE PAINTER.

THE CITY OF COLUMBUS.—This new steamer, an addition to the Ocean Steamship Line of Savannah, was open to visitors on Monday last. She is about the same size as the *City of Jacksonville*. Her gross tonnage is 375 tons long, 38 ft beam, her burden being 2,000 tons. The *City of Columbus* will be commanded by Captain Nickerson. The passenger accommodations are unsurpassed for elegance and comfort. So many of our readers go South during the winter months that doubtless the *City of Columbus* will take out many a tourist bound to Florida.

OAR AND PADDLE.

THE NATIONAL REGATTA.—The sixth annual regatta of the National Association of Amateur Oarsmen was successfully rowed on the Passaic at Newark, August 20 and 21. In spite of the attempts made by certain hair-splitting theorists and the small clique discontented with the strict enforcement of the association's rules to defeat the event, it turned out to be a brilliant affair in all its aspects. If a few prominent oarsmen were conspicuous by their absence the entries were ample and good enough without them, and it is quite certain that no one felt grieved at seeing the obstreperous few left out in an appearance at the start. The two days' races were conducted with such promptness and fairness as to meet the decided approval of all interested, while the preparations for the meeting, both as regards measures for keeping the public informed of the progress of the races and for thoroughly policing the course, proved the gentlemen controlling the races to be fully competent for the duties undertaken. It is not too much to say that this year's regatta has been instrumental, to a large degree, in giving the National Association so firm a hold upon the public mind that its future is secured beyond peradventure. If the association will now review some of its rules, and relax or reconstitute a few particular ones which it has been found impracticable to enforce or unpalatable to some upon, perhaps, justifiable grounds, the few straying sheep will be glad to return to the fold, and all opposition to the association will cease. The course at Newark proved well adapted to the needs of the association, and it is certain that the strangers whom the race called together leave the city with full appreciation of the generous hospitality of its residents, and with satisfaction at the system of rules displayed by the association, for seldom have races been more promptly called and pulled without impediment than in this regatta.

The Arlington crew, we believe, was the only one to demur to the decision of the umpire; but as they were so palpably in the wrong, no doubt when their excitement and disappointment has passed off, they will see the justice of the mandate which ruled them out for the first time. On Tuesday, August 20, was clear and pleasant, with a brisk northerly wind blowing across the river, but not getting up sea enough to trouble the boats. The grand stand, with its system of telegraphic signals connected to the observatory stations along the course, was packed with humanity, and the many private stands, as well as the river banks, were lined with people. On the second day the number of spectators was even greater, and estimated as high as 30,000. The course was one mile and a half straight away, start near the Midland Railroad bridge, and finish just in front of the Erie Railroad draw-bridge, or abreast of the grand stand. An old tug was furnished for the press, and failed to keep even with the racing boats, and, what was equally objectionable, raised a terrific swell at the grand stand every time she came down, so that none of the winning crews were able to show their style on the customary short spin past the stand after the heats, much to the disappointment of the lookers-on, who like to see a little more of a crew than the last half-dozen strokes that carry it across the line.

First race for Junior Singles—First heat: F. Campbell, Eureka, Newark, N. J., and W. E. Cody, Friendships, N. Y. Cody did some bad steering, and was beaten by Campbell by seven lengths. Time, 10m. 53½s.

Junior Singles—First heat: F. J. Mumford, Perseverance, New Orleans, and J. Kennedy, Yale University, New Haven, Conn. Apparently Kennedy was not in condition, for his well-known record assigned him to a better position at the finish. Mumford, however, proved a better man than supposed, and won in 10m. 21½s., Kennedy only three-quarters of a length behind.

Senior Single—Second heat: R. W. Rathbone, New York Athletic Club, New York, and G. Gaisel, Gracery, N. Y.; J. O'Donnell, Hope, New Orleans; and H. P. Dain, Highland, Peckskill, N. Y. Rathbone won without trouble, steering a good course, and pulling a clean and graceful stroke. Time, 9m. 35s.; Gaisel second, 9m. 46½s.; O'Donnell third and Dain last.

Senior Singles—Third heat: G. W. Lee, Triton, Newark; F. E. Yates, Pilot, Grand Haven, Mich.; J. Magin, Waverley, N. Y. The race was between Lee and Yates, and for the first time in the regatta a good race, but the man that can leave Playford astern can hardly be matched in America. Lee won in very handsome style, pulling his long, powerful

sweep, with an amount of apparent ease and grace that called forth continued applause from the spectators. Lee is not only the fastest amateur sculler in America or Europe, but he is also one of the most graceful pullers that ever sat in a boat. Time, 9m. 8½s.; F. E. Yates, 9m. 15½s.; Magin, 9m. 42½s.

Senior Singles—Fourth heat: H. McMillan, Vesper, Philadelphia; R. Livingston, Yale, New Haven, and J. S. G. Wells, Hackensack, Hackensack, N. J. The latter did not go over the whole course. Won by McMillan in 9m. 10½s.; Livingston second, 9m. 22s.

Junior Sculls—Second heat: R. W. Morgan, Potomac, Washington, D. C.; D. Lynch, Waverley, N. Y., and T. O'Connor, Neptune Barge, Philadelphia. The latter did not cross the finish. Lynch led, but was disqualified for being coached. Time, 9m. 11s.

Junior Sculls—Third heat: G. W. Bowlsby, Jr., amateur, Monroe, Mich.; T. Lowden, Viking, Newark; B. S. Keator, Yale, New Haven. The latter gave out. Bowlsby won easily in 9m. 7½s. The tide was with him, having changed to ebb, while in the previous races the flood was making. Bowlsby was bow oar of the Shoe-wae-cae-mettes in 1875, and pulls something after their style, or rather want of style, for he handled the oar in an awkward manner, and had no form. Pairs: F. Henderson and W. Kennel, of the Quaker City Club; C. E. Bulger and H. O. Graves, of the Mutuals; J. B. Clegg and J. McGregor, of the Zeephyrs, of Detroit; and I. S. Mack and W. E. McCredy, of the Athletics. Mutuals took the lead, and held it. The rest steered wild. The Quaker Cityes upset near the finish. Time, 8m. 50½s.; Athletics, 9m. 17½s.; Zeephyrs, 9m. 20½s.

Double Sculls—First heat: Mutual Boat Club, Albany, N. Y., C. Piepenbrink, bow, W. S. Mosely, stroke; Crescent Barge Club, Philadelphia, Pa., C. E. Hallowell, bow, W. H. Hallowell, stroke; Vesper Barge Club, Philadelphia, Pa., C. F. Goodshall, bow, H. Evans, stroke. Won by Mutuals, 8m. 39½s.; Crescents, 8m. 56½s.

Double Sculls—Second heat: Hope Rowing Club, New Orleans, La., J. O'Donnell, bow, P. Powers, stroke; Friendship Boat Club, New York City, E. Conlin, bow, J. McCartney, stroke; Hudson Boat Club, Jersey City, N. J., G. D. Phillips, bow, W. Clarke, stroke. Won by the Hopes in 8m. 31½s.; Friendships, 8m. 51½s.; Hudson crew a bad third.

Second Day—Wednesday, August 21, was clear, with a brisk wind sweeping down the river, making the water somewhat lumpy near the start.

Double Sculls—First heat: The race might have been called the start of some of the ladies' clothes, but otherwise did not interfere with the prompt dispatch of the races. The tide ran up till the third race, when it changed in favor of the crews.

Four—First heat: Mutual Boat Club, Albany, N. Y., C. E. Bulger, bow, H. O. Graves, A. Mull, R. J. Wilson, stroke; Hope Rowing Club, New Orleans, La., M. Tansley, bow, J. Lusk, J. McElroy, M. Carey, stroke. Hopes led off, but Mutuals headed them at the half mile, and won in 9m. 19½s.; Hopes not timed.

Four—Second heat: Eureka Boat Club, Newark, N. J., J. Young, bow, P. Young, W. B. Flavel, J. Anglemann, stroke; Friendship Boat Club, New York City, W. Hurley, bow, M. Robinson, R. Evans, P. Birmingham, stroke, Elizabeth Boat Club, Portsmouth, N. H., D. Calhoun, bow, J. Gallagher, stroke, Atlantic City Boat Club, Elizabeth, caught the water first, but Eureka passed them, steering a better course, as they were well acquainted with the waters. Friendships dropped back. Off the Eureka boat-house the Elizabeths crowded the Eureka crew, and fouled them. Eureka got out of the scrape best, and crossed the line in 9m. 0½s., Elizabeths were disqualified. Had the crew from Portsmouth, Va., started better, the race might have been different. They rowed in fair form, excepting the stroke man, who throws his elbows too much at the recover, in imitation of a Battery waterman. With a little more practice and coaching this crew may become a formidable one.

Four—Third heat: Longueils, of Montreal, F. Foster, bow, A. E. Pell, H. Pell, W. I. Gear, stroke; Centennial, of Detroit, P. Keeler, stroke, John Schuyler, A. Siegenfeld, J. C. Passelton, bow, Longueils, of Montreal, P. B. Thome, stroke, H. V. Young, A. J. Valentine, G. W. Paynter, bow. Longueils broke their steering gear and the umpire called the crews back; but Arlington kept on her way and was disqualified. The other two were started again. Longueils fouled, but Centennials took the lead and won in 8m. 58½s. by six lengths, the Canadian's time being 9m. 17s.

Junior Singles—Final heat: F. Campbell, Eureka Boat Club, Newark, N. J.; R. W. Morgan, Potomac Boat Club, Washington, D. C. Morgan gave out. The other two had a good race over the first part of the course, but Bowlsby won readily in 9m. 40s. Their steering was poor, and the same may be said of a great majority of all entries, crossing the river several times in a zig-zag being quite a common occurrence.

Senior Singles—Final heat: G. W. Lee, Triton Boat Club, Newark, N. J.; R. W. Rathbone, New York Athletic Club, New York City; H. McMillan, Vesper Barge Club, Philadelphia, Pa.; F. J. Mumford, Perseverance Boat Club, New Orleans, La. Lee and Rathbone drew out of the rack and had the race to themselves, McMillan a poor third and Mumford of the Yales out of the hunt. Lee pulled a straight course, and at the end of the race he was in the lead. Eureka boat-house the cheering for the great sculler was immense. Lee spun out his lead and crossed amid great applause, a winner in 9m. 0½s. Rathbone led him a good fight and pulled in excellent form, but was overpowered by his opponent. Lee earned again the title to the champion of amateurs in America, and we cannot name the sculler either in England or on this side who could hold his own with the wonderful man from Newark.

Double Sculls—Final heat: Hope Rowing Club, New Orleans, La.; J. O'Donnell, bow, P. Powers, stroke; Mutual Boat Club, Albany, N. Y., C. Piepenbrink, bow, W. S. Mosely, stroke. For the first quarter they hung together pretty well, when the Mutuals drew ahead. At the half mile they led by a length. Hope spurred and steering a close course by the Eureka house. Here Mutuals crowded them and fouled running past again they beat them. On the Hopes a second time, fouling again and driving Hope away in shore. The latter, however, pulled in ahead and won in 8m. 37½s. They received a warm reception at the grand stand, which was one of the most pleasing episodes of the day's races.

Four—Final heat: Mutual, Saugerties, Eureka, Centennial. Mutuals pulled a quick, short stroke, all working together, and headed the rest of the Triton boat-house, Saugerties second, Eureka third, Centennials doing some faithful steering and the rest none too good either. Saugerties fouled Mutuals and Eureka came up and took part in the scramble; but Mutuals got out of it first and led the rest of the way. Time, 8m. 5s. Saugerties, 8m. 14s. Rest not

taken. The prizes, which were of handsome design and made by Thos. G. Brown, of New York, were distributed to the winners in the evening at Park Hall, Newark, with appropriate ceremonies, Lee and the Southern crew coming in for hearty applause.

COURTNEY-HANLAN RACE.—Representatives of the Hanlan Boat Club of Toronto, Ont., arrived in Geneva August 21, and were the guests of Courtney's backers. The next day they took a look at the course on Seneca Lake, and then went to Auburn. A conference between the parties was had and an agreement for a race between Courtney and Hanlan arrived at. The date was fixed for Tuesday, October 1; stakes, \$3,500 a side. The articles call for still water, but no locality has as yet been determined upon, though it is quite likely to take place at Ensignore, on Oswego Lake.

COST OF THE UNIVERSITY RACE.—The Financial Committee of the New London University race have submitted their accounts as follows: Boat-houses and floats, \$738.76; grand stand, \$593; surveying and buoys, \$54.18; flagging, etc., \$40.59; furnishing quarters for the crews, \$15.37; press, \$247.80; refresh boat, etc., \$148; printing and posting, \$138.35; music, \$237.78; carriages, \$25.50; harbor-master and police boats, \$106.15; transportation of shells and meat, \$48.48. Total, \$2,338.55. Receipts from grand stand, \$566.55. Net expenses, \$1,832. Of this amount three-fourths will be covered by the railroads, the rest by the citizens.

ANNUAL MEETING N. A. A. S.—The annual meeting of the National Association was held at Newark, August 20, Mr. H. E. Buermeyer presiding. Twenty-seven clubs were represented. Messrs. Walsu and Leveque, of the Nauticus Club, New York, were reinstated as amateurs. A resolution was passed to hold three races, open to colleges only, at a future date. After routine business the meeting adjourned.

PRIZES OFFERED.—The Passaic, Eureka and Triton Clubs, of Newark, will each present a challenge cup to be rowed for on the date of the proposed college races.

BURLINGTON BEACH REGATTA.—In the single scull race at Burlington Beach, Ont., August 23, Hosmer won, beating Morris, Ross, McKee, Plaisted, Suter and Coulter, in the order named.

BROWN-LYNCH RACE.—The single scull race, two miles and turn, between Brown, of Worcester, Mass., and Lynch, of Salem, Mass., was pulled, August 22, on Lake Quinsigamond. Brown won in 14m. 45s.

HALIFAX SCULLING.—W. Smith won the championship of Halifax harbor, N. S., for the third time, August 15.

ST. JOHN BOAT RACE.—The three-mile four-oared race at Bay Shore, N. B., between the McLaren and Brett-crews was won by the former, August 21.

CANOEING.—The Orange Canoe Club were out in force on the Passaic during the National Regatta, and attracted a good deal of attention in their canvas canoes.

FAST TIME IN A CANOE.—Mr. Editor: In your last issue "G. L. M." seems to question the speed made by our canoes on a recent trip to the Delaware. As regards our running through Great Fall Rift in three minutes, I would say that both the boat and crew are willing to swear that we ran the rift in that time. Of course, we had no means of finding out the length of this rift except by asking the people, and every one we asked told us two miles. Some of the raftsmen went so far as to say it was two and a half miles long. The current here ran at the rate of a mile a minute, and I have had men who have rafted on the river for fifteen and twenty years tell me that they had run through the rift at the rate of a mile a minute and sometimes faster, for when they were there they swept the river bed. A few years ago a boat-builder at Phillipsburg constructed a boat which he thought could run through the rift (when the water was high), but he found that the current ran so fast that the paddle-wheels had no effect on the water. This was about fifteen years ago, when the river was narrower than it is now. No boat has ever built that can run through the rift, built that we ran the first boats or canoes that have run down the rift in ten years. This I have from fishermen who have lived at the foot of the rift for from ten to twenty years. If you could give me the name of the correspondent who doubts the assertion I might give him a more detailed account of our passage down the river. Otherwise, I can only say: "Let him go down the river from the Water Gap at Phillipsburg, and he will pass his opinion on it." F. P. AND E. P. D.

East Orange, Aug. 24.

Sea and River Fishing.

FISH IN SEASON IN SEPTEMBER.

FRESH WATER.	SALT WATER.
Trout, <i>Salmo fontinalis</i> .	Ser Bass, <i>Sciaenops ocellatus</i> .
Salmon, <i>Salmo salar</i> .	Sheepshead, <i>Achoerodus probatocephalus</i> .
Salmon Trout, <i>Salmo coquytus</i> .	Striped Bass, <i>Morone lineatus</i> .
Brook Trout, <i>Salmo fontinalis</i> .	White Perch, <i>Morone americana</i> .
Grayling, <i>Thymallus tricolor</i> .	Weakfish, <i>Cynoscion regalis</i> .
Black Bass, <i>Micropterus salmoides</i> .	River Herring, <i>Clupea harengus</i> .
Brook Trout, <i>Salmo fontinalis</i> .	Spanish Mackerel, <i>Scomber maculatus</i> .
Yellow Perch, <i>Perca flavescens</i> .	Corn, <i>Cyprinus regalis</i> .
	Tomato, <i>Sardina pilchardus</i> .
	Kingfish, <i>Morone chrysops</i> .

FISH IN MARKET—RETAIL PRICES.—Bass, 25 cents; bluefish, 10; salmon, 25; mackerel, 18; weak fish, 12½; Spanish mackerel, 40; green turtle, 10; halibut, 15; haddock, 8; king fish, 20; codfish, 8; black fish, 15; rounders, 10; porgie, 8; sea bass, 18; oala, 18; lobsters, 10; sheepshead, 20; scallops per gallon, 32; soft clams, 80 to 60 cents per 100; white fish, 12½; pompano, 30; hard crabs, per 100, \$2.50; soft crabs, per dozen, 75 cents.

Fish of all kinds very scarce as it is always the case at this particular season of the year. The catch of Spanish mackerel almost a total failure.

ONTARIO—Waukegan, August 13.—Every stream here is filled with brook trout. They will take almost any bait.

A. N. R. S.

NEW HAMPSHIRE.—Mr. James G. Mczie, a guest of the Fabyan House, Mt. Washington, caught two big trout the other day weighing 3½ lbs. and 2½ lbs. respectively. So says *Among the Clouds*, a paper published on the summit of Mount Washington. Now let us hear from the Gohoroshanks summer boarders.

New Bedford, Aug. 31.—The striped bass fishing at the islands continues to be vigorously followed. Fish are plenty, although much smaller, averaging 10 to 15 pounds each, the largest one caught the past week weighing 34½ pounds. Bluefish, h. sautog, scup, etc., plenty. Excursions and clam bakes ditto. CONCHA.

Nantucket, Aug. 24.—It has been a poor week for fishing on account of the high wind, what few have been caught running very large. The fishermen say that there will be plenty of fish next week. The surf fishermen on the south side are catching a great many fish, anywhere from 70 to 100 to a boat. Shark fishing still continues good, one party catching nine, three of which were blue dogs and one sand shark twelve feet long. JACK CHILWEE.

MOVEMENTS OF THE FISHING FLEET.—The number of Bank arrivals at this port the past week has been 13, 5 with 715,000 lbs. codfish and 8 with 230,000 lbs. halibut. The number of Georges arrivals for the week has been 36, and the receipts 430,000 lbs. codfish and 20,000 lbs. halibut. We notice 6 arrivals from the Bay, with 1,750 bls., and 16 from off shore with 2,500 bls. 364 bls. have been received from the Bay by freighter, and several faves are reported on the way home. Whole number of fishing arrivals for the week, 71.—*Cape Ann Advertiser, Aug. 23.*

CONNECTICUT—Hartford, Aug. 21.—Some good sport was had the past week by a party from here black bass fishing at West Hill pond. The pond, like all those waters artificially raised beyond their original shores, possesses a bad feature. The vegetation on the former border, now under water, produces a greenish scum, which on warm days renders the water quite thick and, of course, unfit for the piscatorial sport. "The pond works," as people thereabouts express it. A cold rain or a brisk breeze settles this scum, and then some fun may be expected by the one well acquainted with the haunts of the fish and the peculiarities of the pond, for it is "just full of 'em." Many of the anglers of that vicinity commit the error of either yanking the fish when hooked out of the water in a most slovenly manner, or of dragging them through their element by main force in order to accelerate the drowning. Both these methods are unsportsmanlike and apt to scare away the whole school, whereas a careful handling of the prey draws the remainder hind, stimulating their curiosity and voracity. By carefully manipulating his tackle, one of our party hooked seven and landed six bass at one place within less than fifteen minutes. One of the funny sights which we had the opportunity of appreciating during our stay at the pond was some jolly country boys drifting in about seventy-five feet of water with twelve feet of line out, and another the discomfited features of an immense fat and hoarse rural angler, who, having hooked a bass through the lip and dragged him through the water at the rate of six miles an hour by swinging his long rod right and left, finally succeeded in landing his hook minus the bass. P. X.

CONNECTICUT—East Hampton, Aug. 26.—At Pocotopang Lake, Uncle Jed is still at the front. He captured three black bass this morning that weighed 7½ pounds, the largest one weighing 5½ pounds. Fishing has been very good for a week past. HARRY COLVER.

WISCONSIN—Waukegan, Aug. 23.—Bass bite freely in Bantam Lake, Littleton; average about two pounds each. West Hill Pond is still a bad spot to try one's luck, although fairly alive with black bass. B. A. K.

ART AND ANGLING.—It is not given to all men to catch a fish and then accurately sketch it. A delightful combination of accomplishments is this. A correspondent, "R. E. B.," sends us an exceedingly neat pencil sketch of a fish which he wishes us to identify. The outline and contour are quite accurate. We have no doubts in pronouncing it to be the *Micropterus salmoides*. "R. E. B." writes from Ferrisburg, Vt.:

"I am told that in the northern part of Lake Champlain there is a large bass having more the sunfish shape and darker color than this, which is dark greenish on the back, lighter greenish on the sides, and white beneath. Our bass is the gamiest fish of the waters of the lake, and has been greatly increased in number since its protection. The ordinary weight may be set at 2½ lbs., though they frequently exceed it by one, two and sometimes three pounds."

NORTH CAROLINA—Fort Johnston, Aug. 21.—Some ten miles from here lies the wreck of the blockade runner Antoinette; sent by the natives to be a good place to fish, and thither I went last Friday. We should have reached the fishing ground at "low water slack," but the wind not being strong enough, did not reach it till rather late. Caught one hundred and ninety-five fish (five persons), one hundred and sixty-four trout, weighing from two to three pounds. The remainder were blue fish and angel fish. To secure all these required less than one and a half hours. On Monday I went out again. The wind blowing quite strongly from the S. W., and a heavy sea running. Only one trout was caught, but in about the same length of time as above mentioned, three of us succeeded in catching two hundred and thirty fish, nearly all blue fish, and very nearly the weight of the trout. I have caught many fish before, but never had such sport as this, yet my native tells me that I should go out when the fishing is good. As it was, for a time it was glorious sport, but after a while it became rather suggestive of hard work. A. D. S.

FLORIDA—St. Augustine, Aug. 22.—Sheepshead weigh from two to fifteen pounds and are caught in great numbers. SILVAIN.

STRAY NOTES FROM THE EDITOR.—D. H. Fitzhugh's party have just returned from the Au Sable River, where they took several hundred grayling, conscientiously returning to their native element all fish under ten inches in length of those caught. The party comprised Hon. S. T. Holmes, of Bay City; A. B. Turner, of the Grand Rapids Eagle; your humble servant, Mr. Hallock, editor of FOREST AND STREAM; Mr. Fitzhugh and four guides, one of whom was a justice of the peace for Crawford County. Justices of the Peace in this part of the country can cook and pole a boat as well as any one. One of the notables of the party is the old river-man Lew Jewell, who has acted as poler and Pullinurus for Milner, Mather, Thad. Norris, Geo. Dawson and many other eminent anglers. Dawson was here only three weeks ago. Just now there are several distinguished companies in camp on the Au Sable, including Judge Norris and son and Mr. Sweet, of Grand Rapids. A large

delegation of the Union Pacific Railroad people from Chicago left last Sunday. They caught 2,200 grayling, of which they returned 1,000 to the stream. For one dozen voracious eaters, three weeks on the river, a thousand fish or so do not go far. I wish I could give the names of a party from Central New York, who caught many little fish and left them dead upon the strand. Such wanton waste is execrable. The river is beautiful, and I shall write at length of it anon. Parties take the Mackinac branch of the Michigan Central road from Bay City to Grayling; thence descend the stream 25 to 30 miles and come out by wagon to Cheney, a station ten miles from the river. There is good hotel accommodation at Grayling and Cheney, and a shanty hotel on the Au Sable at the terminus of the road. The grayling season lasts until November, and parties are arriving on the river almost daily. Fraser House, Bay City, Mich., Aug. 24. HALLOCK.

BLACK BASS FISHING IN LAKE PEPIN.—Black bass fishing in Lake Pepin has been unusually good this season. The evening before Mr. Hallock arrived here I had the following remarkable good and bad luck. Tackle consisted of 80z. bamboo rod, single gut leader, with three of my Lake Pepin bass flies: First cast, 2 hooked, 1 saved; second cast, 1 landed; third cast, 3 hooked, 2 saved; fourth cast, 2 landed; fifth cast, 1 landed; seventh cast, three landed. Four of these were large fish, one of the three saved weighing 5½ lbs., the other two (of the same cast) weighing just 5½ lbs. This cast surpasses all of my former experience in black bass fishing, and never heard of anything to surpass it. But to save more than one on a single gut leader, and with an 80z. rod, is a most trying and delicate task. Consequently I now use but two flies, and did I not make my own rods should use but one. With three large black bass on at once, something is most sure to be carried away and ruined, so I wrote very early in FOREST AND STREAM that to get three on at once is about equal to losing all and ruining tackle. With my two flies I often save two at a cast. Mr. Hallock while here fished with one fly, and I will leave him to tell of the sport he had. I will say that his visit with us at Lake City was a most enjoyable one to us all, and with him we had a most splendid sport. Two evenings after Mr. Hallock left, in one hour's time I took twelve black bass with my two flies, three times saving two at once. In three evenings I took forty-one black bass, and every one with my own flies and with my 80z. bamboo trout fly rod. Now if better black bass fishing has been done in any other waters let us hear the particulars. DR. D. C. ESTES.

CALIFORNIA—San Francisco.—Rock cod fishing engages the local angler during August and September, and one who knows all about when, how and where to go, tells the *Pacific Life*:

"Having obtained a suitable boat and some one acquainted with the bay that knows how to handle her, and being provided with an anchor, and at least one hundred feet of anchoring line, fishing-lines, with plenty of spare leads and hooks, bait, and something to sustain the inner man, good fishing may be found at any of the following-named places: Arch Rock, which is situated a little below the water and to the westward of Alcatraz; Black Shag Rock, which is but a short distance to the south of Arch Rock; Fort Point, Lime Point, Kershaw's Point, Angel Island, and California City. The depth of the water varies from thirty to eighty feet, with rough rocky bottom. The fishing-lines should be at least one hundred and twenty feet long, with a lead weighing one pound. The best lures are rock-cod fishing are medium-sized Limerick hooks. The best bait is worms or fresh minnows or sardines, and the best time to go is on the neap tides, which occur at the first and third quarter of the moon."

FISHING MASTERS.—Acting Secretary of the Treasury Haley has issued a circular to Collectors of Customs, directing them to obtain from the masters of fishing vessels arriving within their districts reports showing, as far as practicable, the quantity and kind of fish taken by them within three miles from the shores of Canada. The form of the master's report requires the value of the fish to be given, exclusive of the cost of barrels, salt, packing and inspection; the tonnage of the vessel, number of crew and time employed. The circular also requires the Collectors to forward the department, with such return, a list of the vessels licensed for the fisheries in their district, indicating which of them are employed in the cod, the mackerel, the whale and the halibut fishery, respectively, and which of them fish in foreign waters during any part of the year.

Game Bag and Gun.

GAME IN SEASON FOR SEPTEMBER.

Moose, <i>Alces naevius</i> .	Black-bellied plover, ox-eye, <i>Squatarola bicolor</i> .
Caribou, <i>Parus rufus</i> .	Ring plover, <i>Agallia semipalmatus</i> .
Eik or wapiti, <i>Cervus canadensis</i> .	Squirrel, red, <i>Sciurus h. 13-lineatus</i> .
Deer or Va, deer, <i>C. virginianus</i> .	Long-shanks, <i>Himantopus nigricollis</i> .
Squirrels, red, black and gray.	Woodcock, <i>Philohela minor</i> .
Hares, brown and gray.	Red-breasted snipe, or snipe, <i>Centrocercus urophasianus</i> .
Wild turkey, <i>Meleagris gallopavo</i> .	Macrorhamphus griseus.
Painted grouse or prairie chicken, <i>Tetrao urophasianus</i> .	Red-backed sandpiper, or ox-bird, <i>Actitis macularia</i> .
Wild turkey, <i>Meleagris gallopavo</i> .	Great marbled godwit, or marlin, <i>Limosa fedoa</i> .
Flamingo, <i>Phoenicopterus ruber</i> .	Wilson's snipe, <i>Centrocercus urophasianus</i> .
Finned grouse or pheasant, <i>Bonasa umbellus</i> .	Tattler, <i>Totanus semipalmatus</i> .
Quail or partridge, <i>Ortyx virginianus</i> .	Yellow-shanks, <i>Totanus flavipes</i> .

"By birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf scur, phalarope, avocet, etc., coming under the group *Limicola* or Shore Birds.

CANADA—Peterboro, August 17.—Reports are made to me from different sections in this county stating all kinds of game plentiful. On the Ontario River and Rice Lake black, wood and gray ducks are in thousands, moving about in large flocks. The wild rice is showing up well just now, and no doubt a large crop will be harvested next month by the Indians at Rice Lake. In Stoney Lake, Deer Bay, Pigeon Lake and Creek and Burleigh summer ducks are more plentiful than they have been for years; perhaps, owing to the early season, many of the ducks have brought out two broods. Deer are reported running about the woods in great numbers. On account of there being very little snow, last winter should have been a favorable one for deer. We expect to hear of some heavy bags being made by sportsmen

when the game season opens. Duck shooting begins September 1, deer shooting September 15, and partridge October 1. Sportsmen should take notice that these dates are considerably changed from last year's. Mr. G. B. Sproule, who was camped a few days at Lovesick Rapids, on Deer Bay, early this month, reports very fine sport with black bass both above and below the Rapids; scarcely a fish weighing less than five pounds, and game to the last. Our game protective clubs are now reaping their reward. C. A. Post.

ONTARIO—Waukegan, August 13.—Deer and summer ducks have not been so plentiful for years as they are now. No hunters here to disturb the game. A. H. R. S.

MASACHUSETTS—Orchard Grove, Parker River, Aug. 22.—Gunning good, with prospects of heavy flights soon. Upland plover and brownie (black-breasted plover) quite plenty. Bags of 75 and thereabouts, mixed birds, quite frequent. NIMROD.

Salem, Aug. 20.—A few uplands on our Hills, and very plenty on Plum Island. R. L. N.

LONG ISLAND.—Mr. Orville Wilcox, the popular sportsman's host, formerly of Good Ground, L. I., has removed to Quogue, L. I., where he presides over the Ocean House.

PENNSYLVANIA—Uniontown, Aug. 20.—The first coon hunt of the season was joined in by J. R. Frey, John Boring, Lucien Bowie and Wishart Miller. They struck the trail in the Brown settlement last Monday night and captured eight coons on two trees.

SOUTH CAROLINA—Kingston, August 20.—Since the game law has been in effect the increase of deer has been very perceptible, and I think in a little more time they will be almost as abundant as in the times of yore. Around Kingston quail are very plentiful. In the fall there are a great many trapped, but not enough to impair good shooting in season. A friend of mine went out last night and caught four raccoons and a couple of opossums, which are quite plentiful. M. F. H.

Charleston, August 17.—Two parties have been out after deer this week, and were successful in bagging one on each hunt. Deer are plentiful this year, and fine sport is anticipated this fall.

Fort Johnston, August 21.—Rall are to be found in quantities: reed-bird later; plenty of duck in season; inland shooting fair, but late; too hot and too many snakes.

MISSISSIPPI—Paulding, August 16.—Party of four in one morning's shoot bagged twenty-five squirrels. Turkeys are reported quite numerous. VAL.

LOUISIANA—New Orleans, August 21.—We are having plenty of "pappa-bots," very fat; one of the finest of game birds; fat only a few months in the year.

MISSOURI.—Mr. Geo. A. Newett and Judson Ayers, on the 15th inst., shot eighteen deer and one bear at Helena. The deer are very plenty in this section this season, owing to the mild winter.

Reed City, Aug. 21.—Parties are arriving by the Grand Rapids and Indiana Railroad, bound north, to take advantage of the splendid bird and deer shooting in the northern counties as soon as the season opens in September. The fishing there is splendid. II.

Grayling, Crawford Co., Aug. 24.—Sportsmen are here with their guns, waiting for the shooting season which opens September 1, passing the interval in fishing. Deer and ruffed grouse are abundant, and ducks will be plenty. Take the Mackinac branch of the Michigan Central Railroad to Grayling and hunt along the Au Sable River. From Cheney, on the same road, it is three miles to Higgins Lake, and from Roscommon to Houghton Lake, eleven miles, where there is good duck shooting. HAN.

OHIO—Columbus, August 20.—The Columbus Shooting and Fishing Club was organized yesterday, with the following officers: Pres., Dr. J. K. Flowers; Vice-Pres., E. Savage; Sec. and Treas., Dr. W. Shepard. The tone of the club is excellent, and their skill as amateurs by no means insignificant. W. B.

A VERY REMARKABLE STUFFED BIRD.—We don't mean by this caption that the bird is well stuffed, or a chef d'œuvre of the taxidermist's skill. All about it which is really remarkable is what Captain Bogardus told us in regard to that particular pigeon. "That was the last bird I shot in England in the match with Mr. Aubrey Coventry. It would have made a tie if I had not killed it! Was I excited? No; not a bit. I knew I could grass it, and I did. It was stone dead before it reached the ground. I fancy there was something like £20,000 on that bird, and it made a difference of \$5,000 to me, and more than that to my friends. Kind of natural, ain't it, that stuffed bird?" and the Captain's face beamed with it, at least, a \$10,000 smile.

THE INTERNATIONAL PIGEON MATCH.—This match, as proposed by us in our last issue, has excited much comment, and we are led to suppose from the favorable reception it has met with that such a team match between the gentlemen of England and America would be quite possible. Captain John M. Taylor writes us as follows:

You state that arrangements can be made with Captain Shelly as to an International Pigeon Match. In my letter you will see that it was Mr. Dougal, gunmaker, St. James street, London, who had a conversation with Captain Shelly at Monaco on this subject. The way an International match was talked about began in this manner: At the Memphis Fish Trials I met Mr. Greene Smith, and I think, Mr. S. H. Turritt. Mr. Smith asked me into a private tent he had on the grounds, when the conversation turned on pigeon shooting, I remarking that I thought light guns could beat heavy guns. Mr. Smith disagreed with me and said, "Can you find four or five Englishmen to come over here and test this question?" I replied that I thought I could. So on my late visit to England I mentioned this matter to many crack shots, and they seemed to entertain the idea, provided, as I say in my letter to your journal, that all preliminaries are arranged on this side first and then submitted to Captain Shelly and his friends. JNO. M. TAYLOR.

"The Retreat, Bellefonte, Nottoway Co., Va., Aug. 26."

The one-mile run was won by W. J. Duffy, of New London, in 5m. 44s. E. C. La Montagne, of the New York Athletic Club, won the 440-yard run by half a yard in 56s.

In the high jump H. E. Ficken, of the New York Athletic Club, jumped 5 feet 1 inch; Wm. L. Boars, of Staten Island, and B. H. Bayre, of Columbia College, 5 feet each.

H. E. Balmeyer, of the New York Athletic Club, shot the shot 35 feet 5 inches; John Burton, of the Staten Island Club, 34 feet, and F. Johnson, of the Union Club, 33 feet.

The first heat in the 250-yard run was won by L. H. Warren, of Yonkers, in 28 1/2 s.; the second by McQuinn in 28 1/2 s., and the third by Hewitt in 28 1/2 s. The final heat was won by McQuinn in 26 1/2 s. For the broad jump Geo. McNichol, of the Manhattan Club, jumped 15 feet; H. Johnson, 14 feet 10 inches, and W. H. Mahoney, of New London, 17 feet.

The 600-yard run was won by Ralph Voorhees, of Greenpoint, L. I., with eight yards to spare, in 1m. 19 1/2 s. The first heat in the 250-yard run was won by L. H. Warren, of Yonkers, in 28 1/2 s.; the second by McQuinn in 28 1/2 s., and the third by Hewitt in 28 1/2 s. The final heat was won by McQuinn in 26 1/2 s. For the broad jump Geo. McNichol, of the Manhattan Club, jumped 15 feet; H. Johnson, 14 feet 10 inches, and W. H. Mahoney, of New London, 17 feet.

The first heat of the 120-yard hurdle race was won by J. Lafon, of the New York Lacrosse Club, in 32s.; the second by H. E. Ficken in 19 1/2 s. In the final heat Ficken was first, Lafon second, and Johnson third. Time, 18 1/2 s.

In the mile walk Wm. Purdy, of Greenpoint, was first, H. E. Ficken second, and B. W. Anderson third. Time, 1m. 35 1/2 s. La Montagne won the 220-yard run by five yards in 24 1/2 s.; J. B. Valine second, F. J. McQuinn third.

The pole-leaping was won by Geo. W. McNichol, who made 9 feet 6 inches in the jump; Wm. L. Boars, 9 feet.

The half-mile run was won by W. H. Griffin in 2m. 24 1/2 s.; E. C. La Montagne second, and W. R. Hewitt third.

In the 440-yard hurdle race La Montagne won by 9 yards in 1m. 2s., Iglehart second, and Work third. The official time made it 1m. 2 1/2 s.

The New York Athletic Club beat the Scottish-American Athletic Club in tug of war. Time, 18s.

HUGHES' "WALK."—Hughes, the pedestrian who has been working for a record, accomplished his 500 miles within six days, at Newark, finishing at 10:25 p. m. last Saturday. Why this performance is called a "walk" we are at a loss to understand. As a test of endurance it is noteworthy, and as a runner Hughes has won well-deserved notoriety. Hughes concluded his fifth day with 425 miles. He continued to walk 11 miles, making 436 miles, then retired till 1:30. He made his 430th mile in 9m. 45s.; retired at 12:55 p. m., and again took the track at 2:16 p. m. At the conclusion of his 470th mile he rested an hour and six minutes, after which he took only a few brief breathing spells. On his 471st mile his right foot was badly cut by an attendant while attempting to cut off a piece of his shoe, the wound bleeding very freely. On his 490th mile he ran two laps with his little 4-year-old boy of his hand. The last ten miles were made in 1m. 7m. 41s. 17m. 8s., 15m. 16c., 11m. 50s., 16m. 9s., 6m. 5s. The last mile was made in a run of 6m. 5s., the 500 miles being made in 55m. less than six days.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

AN number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

C. G., Philadelphia.—We will reply at length next week.

H. F. D., Greensburg, Pa.—We shall be pleased to hear from you again.

H. S. F., Marlboro, Mass.—Communication received and used, as you will see.

C. E. C., Bradford.—Sorry cannot reply, but not in our line. Consult Bradstreet.

M. F., Red Hook.—Bohemian Glass Co., or Haggerty & Co. See advertisement.

M. L. W., Spender.—Address McKoon, Franklin, Del. Co., N. Y., for a small tucker.

RIEKLING, New Haven.—For particulars of Creedmore Fall Meeting see our Ride column.

J. C., Muncy, Pa.—You can get the needles of Peck & Snyder, Nassau st., New York.

G. J. B., Jersey City.—In Connecticut you may shoot ducks, brant and geese in September.

R. R. C., Buffalo.—Write to West Jersey Game Protective Society, 106 Market st., Camden, N. J.

F. H. W., Elmira.—Buy by all means the second-hand gun you mention. There is no better maker.

BRANTNER.—Write to Jonathan Darling, East Lowell, Penobscot Co., Maine. He will take you to the game you want.

A. H. N., Jr.—There is really no difference between the various traps that we ever could judge. Your targets are very good.

MARINE ARTIST, Portland.—The address of Mr. A. Carey Smith, artist and naval designer, is 61 West Tenth st., New York.

E. P. B., Gouverneur, N. Y.—Models of skulls are not in use anywhere. For construction of one see our paper of Aug. 2, 1871.

E. H. L., Clover Creek, Pa., and H. L. F., Indian Lake, Hamilton Co., N. Y.—Young bear cubs are worth, delivered, from \$10 to \$15.

S. D. ROR, Richmond.—The Indiana open season for quail begins Nov. 1, and expires Jan. 1. For a 7 1/2 lb., 12 gauge, gun use 3 drs. powder, 1 1/2 oz. shot.

L. N. E., Fire Island.—For good bass fishing within a short ride of Saratoga, go to Greenwich, N. Y. For local information write to D. W. Mandel, of that village.

G. W. J., Morris-town.—In Virginia next month you may shoot deer with bow, fowls, geese, plover, and other game birds excepting quail, for which the season opens Oct. 15.

H. R. B., S. Myresam, N. Y.—Write to Geo. W. Reed & Co., 200 Lewis st., N. Y. Mention our name. He supplies all kinds of boat building woods in prepared form.

OLD BRADEN.—How am I to get rid of fleas on my cats? Ans. Some one might suggest a terrier. We said, "Wash your cat, and rub kerosene on her, remove kerosene by washing again."

E. K. C., Boston.—Shadow canoe costs from \$100 to \$125 according to finish, including paddle and sail. Rob Roy canoe is slightly cheaper. Ruston builds an excellent Rob Roy for \$75 complete. See our advertisements.

Dr. R. A. A., Montreal.—We do not know a ride by the maker you mention. Inquiries in New York have not yet any information.

B. F., Newark, N. J.—You will find very good hunting and fishing grounds in Pennsylvania about Raistow, Lyncum, etc. For hunting dogs see our advertising columns from week to week. There is a gun club in Newark.

F. P. W., Philadelphia.—The question you asked us could not be replied to at once, as the information we had collected was meagre and not reliable. Since you inform, however, so much impatience, you are quite welcome to seek the information where you please.

C. C. E., Boston.—To keep moths out of preserved birds' wings: Wash with a solution of corrosive sublimate and water. Use carefully, as it is a deadly poison. This recipe was given in our issue of May 9, 1878. When you wrote you probably had not received the index to vol. 10.

T. C. B., Brooklyn, N. Y.—How long are sand snipe in season on Coney Island? Ans. So long as the swigs of the waves on the shore, the silver tones of Leroy's corals, and the soft murmurings of the dary-eyed maiden on the shore, make melody sweet to the ears of this strange, shy bird.

Z. M., Red Bank.—We must stay by our first ideas as to your changing of guns, and cannot help you. Two-thirds of the pellets is a high standard of targeting at the distance you indicate. You can make your calculations from this. We think you would want a 12, weighing some 7 1/2 pounds.

G. D. K., Carlisle.—For rust in or on gun barrels we can advise of nothing better than a scratch-brush. Rust eats into the metal, and once there is rust, the minute erosion remains. Oil carefully before using the scratch-brush, and after it. We recommend Eaton's Rust Preventive as an excellent preventive.

C. W. W., Fairland, Ind.—Do not think you should have the least solicitude about the Dittmar powder. We believe it to be perfectly safe. The gun you speakabout would stand the charge perfectly well, though why you should want to use so much powder we do not know. See article in last V. & S. about overcharges.

RED SPINNER, Boston.—In West Virginia you will probably find good trout fishing about Berkeley Springs, Morgan county. You can find entertainment at some of the farmhouses in the neighborhood, if you prefer that to boarding at a hotel. Terms reasonable. Parkersburg, Wood county, also offers attractions to the trout fisherman.

H. T. E., Lynn.—To waterproof your tent: Dissolve one-half pound sugar of lead and one-half pound powdered alum in a bucket of rain water; pour off into another vessel, and steep your canvas in it, letting it soak thoroughly. If the quantity is not sufficient, increase in same proportion. Hang the article up to dry, but do not wring it.

W. F. J., Richmond.—Will "Fletcher's bell ball" resist a 22 Ballard? I propose to swing it and shoot at it 25 yards while it is moving. Who is the New York agent? Do you know of any other metal ball for rifle practice? Ans. It resists perfectly the 22 Ballard. There is no other metal ball.

J. W. B., Callaghan.—Please let me know your opinion of the following target, made with a 10 lb. W. W. Greener, 32 in., 10 bore; charge, 4 drs. powder, 1 1/2 oz. No. 8 shot; distance, 40 yds.; target, 25 in. circle, with central bull's-eye of 9 in.; 40 in. circle. Bull's-eye pierced with 97 pellets. Penetration excellent. Ans. An admirable target, and hard to beat.

C. A., Minneapolis.—Please give me the names of some of the reliable makers of Express rifles. How cheap can I buy an effective double Express, 45 cal., using 4 drs. powder? Ans. Makers are: Douglass, Scott, Henry, Webley and Riley. A good one costs from \$200 up. You could not get a 45, we think, now in the country—all imported ones are mostly .50.

O. & C., Battle Creek.—In your issue of Aug. 1 I noticed treatment of the drowned. About how long after being in the water could they be restored? Ans. Your question, though one worthy of a reply, is hard to answer. Cases are recorded of death rather from physical shock than drowning when immersion has not been longer than five minutes. An hour is, we think, a limit.

E. J. D., Williamstank, Mass.—Is a white swallow a rare bird? July 2 I shot a pure white pink-eyed bank swallow (at least I suppose it was a bank swallow, it was in their company, and is the shape and size of them). The bird is mounted, and can be seen at any time. Ans. The bird was an albino. We have accounts in the V. & S. of several albino swallows having been seen.

R. L. G., Louisville, Ga.—Please give me the calibre, length of barrel and weight of the Parker gun used by Dr. Carver with which he made such long shooting at glass balls, breaking them at fifty and sixty yards, in proportion to the last issue! Ans. Dr. Carver used two Parker guns. One Damascus, weight 10 1/2 pounds, 30 inches, 10 bore; the other twist, 10 pounds, 30 inches, 10 bore.

W. W. D., Edge, Pa.—If a bird which has been shot at by a party at the score and is going out of bounds, is shot at by a "scouter," and falls inside bounds, the shooter may claim the bird. Usually, another bird is given. If a bird dies out of bounds after being shot at by a party at the score, and returns inside of bounds, it is scored a lost bird. A bird must show shot marks somewhere to be considered a dead bird.

J. H. T. E., B., Cazenovia, N. Y.—Dixon Kemp's new book on yacht and boat sailing will cost about \$5. It has not yet been received in America, but copies will be on hand in about three weeks. Though an English work, treating of English boats, it is full of valuable information and instruction. The chapters on yacht sailing are the best fore-and-aft seamanship ever published. We have a sample copy at our office.

A. H. F., Coatesville, Pa.—My dog has sores breaking out on body and limbs. Health and skin about as usual; lost considerable flesh. Feed has been part meat, part vegetable. Ans. It looks as if your dog had mange. First reduce his feed, and give her little, if any, meat. Wash her thoroughly, using your hands in rubbing her down. Use an ointment of four of sulphur and lard. Give her a good dose of castor oil by all manner of means.

J. H. D., Cincinnati.—A, B, and D shot a rifle match. Competitors have a right to enter as they please. A missed twice. Ans. Make 42. A on each entry makes 42. They agree to divide the stakes. How many shares is A entitled to? 2. In shooting a match S and G tie with the following score: S, 4 4 5 5 4 4 5 4 3 4 3; G, 5 5 5 4 4 4 4 4 4 3. Which, according to N. R. A. rules, wins? A. Two shares, if he paid two entry fees. 2. S, because he has more bull's-eyes.

J. C. C., New York.—It has caused some trouble at shooting tournaments to decide who are professional shooters. With very rare exceptions all clubs shoot for money prizes, and the rules applying to other contests cannot be used here. We think the term "professional pigeon shooter" can be applied only to the men who shoot ostensibly for a livelihood, or to make money rather than to test their skill. Hence shooting for money stakes, or to decide a bet of money, does not constitute a professional pigeon shooter.

ASTON, Ophir, N. Y.—I need a 45 or 50 cal. rifle for large game at short range, and for convenience in carrying, wish to have it as short as possible. Kindly tell me the minimum length of barrel consistent with strong shooting? Ans. Use a 22 in. long barrel.

G. H. W., Red Bank, N. J.—The New York Herald, Aug. 22, 1878, says: "Josh Billings in one afternoon, in the White Mountains, caught 234 trout." And the Daily Graphic, of the same date, says: "Josh Billings went fishing from the Glen House, White Mountains, last week, and came back with a basket full." Are these statements correct and what kind of a creel did Josh use? Ans. This is a very old story, how old no one knows; of course it is true. Whatever is in a newspaper is true, whatever is in two newspapers is doubly true; whatever is in a thousand papers is a thousand times true. This story has been in a thousand papers. The size of the basket does not materially affect the yarn.

S. L., Belleville, Ont.—Can the American goldfinch be crossed successfully with the common canary, and does the former thrive alone in a cage? What singing bird or birds (not the canary) thrive best in captivity? Should Irish water spaniels have black or red roost to mouth? Are decked canoes, such as the Shadow type, etc., as safe as the ordinary leaved skiff for sailing? Ans. 1. Such crosses have been made, but do not seem to thrive well. The goldfinch alone endures captivity quite well. 2. Mocking birds, robins, bobolinks. 3. Irish water spaniels have mostly dark roosts, but white is no sign of poor. 4. Decked canoes are safer in a seaway under sail than a skiff, after you have learned how to handle them. They are much more serviceable for general use.

M. Y. M. A., Durham, N. Y.—Your bear story in issue of July 25 was in my reading book when I was a child. Pity you have to go back almost half a century for a yarn. To this day I never pass a tree stump standing high above the bottom memory of my quakerish grandpa, the man caught in such a trap. Ans. Yes, the story does smack of antiquity. Probably your great-grandmother read it in her reading book. We don't know how old it is. The older the better. Let the bear be respected for his gray hairs and venerable poll. He has "come down to us from a former (a very former) generation." We don't have such Bruins nowadays. Nor any such thrilling concatenations of exaggerations! agglomerated hyperbolisms about bears and other beasts as good old Sir John Maundeville and the other worthies used to perpetrate several hundred years ago. We grieve to see so much growing respect for the good things of our fathers. We may explain in passing, that the story was published, not as a "bear story," but as a sample of some "historical papers."

W. T. W., Philadelphia.—A shadow canoe costs from \$100 to \$125 sails and paddle included, everything complete, according to quality of finish. The best rig for general cruising purposes is the standard rig, sliding gunter, jib and dandy. The sharpie rig consists of two legs of mutton and is rather simpler, but not quite as handy for reducing canvas. Either is serviceable, however, and no decided advantage can be ascribed to either; the choice depends upon individual preferences. Everson, of Williamsburgh, or Brooklyn, E. D., is one and the same party. Williamsburgh is at present incorporated with the city of Brooklyn in the same as Kensington has been with Philadelphia. Everson is the only party having an authorized set of Shadow moulds to build from. He will not let any one copy them. For a lengthy canoeing trip proceed up the Delaware to Trenton, N. J., then send canoe by rail to headquarters of Susquehanna and explore its branches as far as time will allow. The scenery is very pretty and the country interesting. At the mouth of the river take the Sassafras canal into Delaware Bay and proceed to Philadelphia by sail. You may average 30 miles a day all through, or more.

BRIGHTON BEACH.—Of all the summer resorts in the vicinity of New York, Coney Island appears to have drawn a large proportion of the New York residents as well as those from the vicinity. The people of Long Island and Brooklyn have not been slow in improving these favorable opportunities. Many of our subscribers from Buffalo, Cleveland and Chicago have enjoyed the surf baths at Coney Island, and have given us credit for the information. But half of the story is not told. Coney Island is about four miles long, and has an ocean surf suitable for bathing. In addition to this it has hotel capacity for at least 20,000 people, and ample table-room for as many more. The hotel at Brighton Beach is becoming most popular, being able to accommodate 10,000 people, and in order to reach Brighton Beach from Brooklyn and Coney Island, and their trains run every fifteen minutes from the heart of the city of Brooklyn. This road has five monster engines, weighing thirty tons each, built by the Danforth Locomotive Works. Every train is well equipped with the Westinghouse air brake, and the system of electric signals on the line renders an accident almost impossible. During the season the company have been running from seven to nine cars on a train, with an average of ninety-six passengers on each train every fifteen minutes. Trains of fifteen and even seventeen cars have been dispatched with impunity, when crowded, without any accident whatsoever. All this business of train dispatching is mainly due to Mr. W. E. Dorwin, the superintendent of the road. Mr. Dorwin is well known to us, and his brother, Mr. T. Dorwin, has proved himself a most excellent manager in the West, and is now general passenger agent of the Texas and Pacific Railroad and located at Chicago. Mr. W. E. Dorwin has had twenty-three years' experience in the business. Any one seeing him walking around the depot would think he was the last man in the world to be looked for as superintendent. Every dispatch over the line, however, is brought to him, and on him the responsibility rests. He knows it, and is equal to any emergency. Mr. Dorwin's railroad experience has continued with success. Upwards of twenty years he was in the West and about two years on the Greenwood and Mountclair R. R., where he became disgusted with the management and left. But his capacity here shows what they have lost, as trains are run at short intervals with thousands of passengers without accidents. Messrs. Sweet & Breslin, proprietors of the Hotel Brighton, have shown the public that they are veterans in the business, and the best that the island or water affords is always at hand and at reasonable prices. Their hotel can accommodate 1,000 persons with rooms and all facilities for comfort that can be had at a summer resort. Brighton Beach, in fact, has been a paradise for New York, Brooklyn and travelers from all parts during the season. Railroad accommodations have been so extensive by the connection with the Long Island Railroad that parties can reach there from all parts of Long Island with dispatch, and it only one hour and ten minutes run from the Fifth Avenue Hotel. Brooklyn citizens can go from Atlantic avenue and reach the beach in twenty-two minutes, and enjoy the music, surf and associations, and be home early in the evening. At the beach we find archery as well as bathing and other pastimes. We trust that the facilities next season will surpass those of any resort in the world. This evening there will be a grand display of fireworks.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 35 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements must be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

*Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, AUGUST 29, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, Aug. 30.—Trotting at Waterloo, N. Y., and Vincennes, Ind.
Saturday, Aug. 31.—Duxbury Yacht Club Regatta. Glenwood Athletics at Yonkers, N. Y. American Athletic Club Meeting at Hoboken, N. J. Trotting at Vincennes, Ind.

Monday, Sept. 2.—Beverly Yacht Club Regatta. Quincy, Mass., Yacht Club Closing Sail. Trotting: St. Paul, Minn.; Minneapolis, Minn.

Tuesday, Sept. 3.—Police Rowing Regatta on the Harlem. Trotting: Richfield Springs, N. Y.; Bradford, Pa.; Amenia, N. Y.; Poughkeepsie, N. Y.; Manhattan, Kan.; Galesburg, Ill.; Providence, R. I.

Wednesday, Sept. 4.—Empire Yacht Club Annual Regatta. Trotting as above, and at Delphos, O.; Davenport, Ia.; Gouverneur, N. Y.

Thursday, Sept. 5.—Riley-Smith Match at Bradford Basin. Trotting as above.

MASTERS OF FISHING VESSELS MUST REPORT.—The recent order issued by the Secretary of State to masters of vessels fishing on the Canadian shores is quite important. It is a step in the right direction. So far we have been totally in the dark in regard to our catch of fish. We even hope that in the future masters of fishing smacks, whether employed on a foreign coast or on our own shores, will be instructed to give full particulars, not only as to kind, but the weight or numbers of their catch. Just such a measure as this was strongly urged by the American Piscicultural Association at their last meeting. At present there is not a civilized country in the world which does not obtain an account of the catch of fish made by its people. Without such statistics how is it possible to discover whether certain kinds of fish are increasing or decreasing? We would like to have the instructions to Masters made to cover not only those fishing near the Canadian shores, but to include all the fisheries of the United States. In New York the count of the fish is now being made by private individuals who, at the request of the Commissioner of Fisheries, are industriously collecting the facts.

DRAFTS AND MONEY ORDERS.—All drafts, checks and postal money orders sent to us should be made payable to "The Forest and Stream Publishing Company." By observing this rule our subscribers and advertisers will save themselves and us much needless annoyance.

TIME ALLOWANCE.

A CORRESPONDENT writing to a contemporary proposes to handicap yachts according to their abilities or performances. This proposition is one of those fallacies that can only come to the surface through want of sufficient study of a subject very elementary in its nature. It is an old failing that crops up among novices about once every season and has to be combated over and over again. To handicap yachts with reference to performances means, theoretically, simply to bring them all to the winning line at the same time, necessitating the dividing of the cups between all hands. Time allowance, be it understood, is not granted for different performances at all. It has nothing whatever to do with the sailing of a yacht. It is granted in compensation for difference in size; for nothing else. It is a means by which models of different sizes can be tested for their sailing qualities. Any proposition to handicap sailing qualities is untenable upon the very face of matters, for it would be placing a lie upon superior design for speed and a premium upon a poor design, and it is to be regretted that such a misleading suggestion has again found its way into print. However, as in this case the correspondent did not assume to speak editorially, his opinions will probably not carry much weight. They serve simply to show how little real study is given as yet to questions at issue among yachtsmen. We will recur to the subject of time allowance at a future date. In the meantime readers who may have the matter under discussion will do well not to overlook the fundamental object for which time allowance is instituted, viz.: to enable yachts of different size to fairly test the sailing value of their models by neutralizing the advantages of excess of size through an allowance of time in proportion to the advantages innate to such excess.

PROFESSOR SPENCER F. BAIRD.

Prof. Spencer F. Baird, Sec'y of the Smithsonian Institution and U. S. Commissioner of Fish and Fisheries, was born Feb. 3, 1833. Educated at Dickinson College, Professor Baird graduated in 1849, and in 1846 was appointed professor of natural sciences in that institution, where he remained until 1850, when he became Assistant Secretary of the Smithsonian Institution. Professor Baird's appointment as Commissioner of Fish and Fisheries dates from 1871. On the death of Professor Henry, Professor Baird was unanimously elected to the position of Secretary of the Smithsonian Institution.

MIGRATIONS OF THE LEMMINGS.

FROM the very earliest times the migrations of animals have formed one of the most attractive subjects of speculation for the naturalist or philosopher. Although these general movements have been observed and wondered at for many hundreds of years, their causes, and the laws which govern them, are as yet unknown. Explanations, which are in a general way satisfactory enough, have been suggested to account for individual cases, but the whole subject requires more study and observation than has yet been given it. The day has passed, it is true, when it was believed that the birds, like the reptiles, batracians and some mammals, passed the period of severe cold in a state of torpor, reviving at the approach of spring, and issuing forth during the warmer hours of the day, only to return again to their holes and crannies if a sudden change in the weather deprived them of their insect food, or threatened death by freezing to themselves. The rails are no longer imagined, at the approach of the severe frosts, to bury themselves in the soft mud at the bottom of the marshes, where they contentedly remain until warned by the movements among the roots of the water-plants that the season of love is once more at hand, and that parental duties once more demand their attention. Nor are the little grebes at present supposed to swim semi-annually from their winter quarters in the Southern States to their breeding places in the Arctic regions.

The migrations of birds, however, have been much more carefully studied than those of any other group of animals, and by general consent the two causes most potent in influencing the regular spring and autumn movements are temperature, and abundance or lack of proper food. The irregular movements of various species of birds which occasionally

visit certain sections of the country have no doubt special causes, and although generally attributed to those above mentioned, but little is really known about them.

Still more unintelligible appear to be many of the migrations of mammals which so often take place. The very general movement by which enormous numbers of the gray squirrels change their locality is a case in point. Driven by what is usually termed a blind instinct, they set their faces in a certain direction, and, undeterred by any opposition, proceed on their way. They cross wide rivers, pass through towns and across railroad tracks. Men and boys, armed with every imaginable weapon, slay them by scores or by hundreds, but still they keep on, apparently heedless of these attacks, and at last disappear. Of the case of many of our deer, which, as is well known, change to a greater or less extent their location with the season, little need be said, as the conditions of their existence render different ranges necessary in summer and winter. One species known, the Barren Ground Caribou, performs a true migration, and takes, each spring and fall, a long journey to and from the regions of the extreme north. The summer is passed on the shores of the Arctic Sea, where the females, soon after their arrival in May or June, bring forth their young. They remain on the coast until September, when they turn their faces southward and proceed to the wooded districts which lie between the sixty-third and sixty-sixth parallels, where they pass the winter, returning northward again in early spring.

Perhaps the most extraordinary migrations of which we have any account are those performed by the Norwegian Lemmings, a little rodent hardly as large as a squirrel, of which the most fabulous stories have been related. It is said, among other things, that no barriers are able to stop their progress, and that they pass over, or through, every obstacle. That quaint, and we fear not altogether trustworthy, old traveler, Regnard, in his *Voyage en Laponie*, says of the Lemmings: "When it is necessary to pass some lake, or river, as happens at every step in Lapland, these little animals take the bark of a pine or birch tree, which they drag to the brink of the water, they then set themselves upon it and abandon themselves to the mercy of the wind, erecting their tails like sails, until the wind, becoming stronger, overturns both the ship and the pilot. This shipwreck, which often overwhelms 3,000 or 4,000 vessels, generally brings an extraordinary influx of wealth to those Laplanders who find the remains on the shore, and who, if the little animals have not been too long on the sand, make use of them for food, etc. Many of these animals make a successful voyage and arrive safe in harbor, provided the winds be favorable and not strong enough to raise any waves, which need not be violent in order to engulf these little craft. This singular performance might be considered as a fable if I had not witnessed it myself." The Italics are ours.

An interesting paper was read before the Linnean Society, of London, some time since by Mr. W. Duppa Crotch, who, during ten seasons of northern travel, has accumulated a number of interesting facts with regard to the Lemmings, their migrations and habits in general. Although Scandinavian naturalists would seem to have had ample opportunities to study the movements of this animal our knowledge of the subject, up to the publication of this paper by Mr. Crotch, was very imperfect. The author of the present account, passing by the marvelous tales of tradition in respect to these migrations, discountenances the opinions of later writers that lack of proper food or the approach of cold weather causes the movements of the Lemmings. It is observed that the migrants always travel to the westward and at last, after their ranks have been thinned by accident and the attacks of their predatory enemies, perish in the sea in great numbers. Collet tells us, and the instance is well authenticated, of a ship sailing for fifteen minutes through a swarm of these animals, the water being literally alive with them as far as the eye could reach. Mr. Crotch believes that the instinct which leads them to travel in this direction is hereditary, and that their ancestors in ancient geological times inhabited a land somewhere to the westward, now submerged beneath the waters of the Atlantic. He further states that the migration is not completed in one year as was formerly believed, and that the animals do not, as has been stated, form great processions and cut their way through all obstacles; but that they breed several times during the season, and, gathering together in droves, make at intervals a move in a westerly direction. The pugnacity of these creatures is something surprising, and at the approach of any animal they back against a rock or stump and scream with rage. Even the shadow of a passing cloud is said to rouse their anger. Mr. Crotch found on most specimens a naked spot on the buttocks, where the hair had been rubbed off by their assuming the defensive position just referred to, and he expresses surprise that it should simply be bare of hair and not a callosity. In their migrations the Lemmings cross wide lakes by swimming, but they are easily frightened when in the water, and lose all idea of direction, and if the surface of the water be at all ruffled are inevitably drowned.

While on the march they suffer from the attacks of all kinds of animals. The reindeer are said to trample them under foot at every opportunity, and carnivorous animals of all kinds and rapacious birds prey upon them constantly; but still they press on—westward. Mr. Crotch calls attention to the fact that fossil remains of the Lemming have been found in England, thus showing that this animal had advanced thither before that island was separated from the Continent.

The subject is an attractive and suggestive one, and is well deserving of further attention. As suggested by our London

contemporary, *Nature*, "It is certainly remarkable how a settled westward course is that chosen, calling to mind the similar direction which races of men are assumed to follow."

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

Tennessee State Sportsmen's Association, Nashville, Dec. 2. Sec'y., Clark Pritchett, Nashville, Tenn.
Wisconsin State Sportsmen's Association.
Massachusetts State Sportsmen's Association, at call of President
Missouri State Sportsmen's Association.

MEETING OF THE NEW JERSEY STATE ASSOCIATION.—We trust our friends among the New Jersey sportsmen will not forget the adjourned meeting of the Association for the Protection of Fish and Game, to be held at Newark on the 5th of next month. A full meeting is earnestly requested, as not only final arrangements must be made for the State Shoot, if one is to be held this year, but a full and free expression of opinion is desired as to the proper legislative action to be taken this winter on the very conflicting game law of the State. Other matters of importance will come before the meeting. We are in receipt of the following official notification:

"Notice is hereby given that the New Jersey State Association for the Protection of Fish and Game will hold a meeting at the Clarendon Hotel, 495 Broad street, Newark, N. J., at 1:30 p. m., September 5. All delegates are requested to be present, and all organized clubs of the State, which have not yet joined, are invited to attend and receive three delegates each. J. VON LENSCHKE, Rec. Sec."

TENNESSEE.—Legislation is sorely needed to prohibit the wanton destruction of fish by seining in Harpeth River and other streams of this State. The formation of numerous game protective clubs of Tennessee sportsmen will in time, we trust, be effective in securing sufficient public interest in these matters to see that the supply of game and food fish is properly protected.

AN UNFAITHFUL STEWARD.—Chicago, Aug. 12.—*Editor Forest and Stream*. I notice in your issue of Aug. 8, a communication signed S. M. E., Watertown, Wis., in which he speaks of one Joe Markers shooting at Lake Koshkonong, on July 20th and 31st, some thirty-eight woodcock. Perhaps S. M. E. does not know that the open season for woodcock in Wisconsin does not open this year until Sept. 25th; but such is the fact. Markers is the steward of the Black Hawk Club of Lake Koshkonong, and no doubt the members will be a little surprised to learn his manner of preserving their game. The fact is, however, he never did pretend to keep the game laws, and it is time the club knew of it and took some action. HOWARD.

HUNTING DEER WITH DOGS.

KINGSTON, S. C., Aug. 20, 1878.

EDITOR FOREST AND STREAM:—I beg leave to differ with the gentleman from Maine in regard to "Hunting Deer with Dogs." There are quite a number of deer in South Carolina, especially in the counties of Williamsburg and Georgetown. The only way they can be killed is with dogs. This is my experience, and it is also that of a good many old hunters whom I have conversed upon the subject. If a deer is chased and sent away without being wounded, you will be certain to find him back about the same spot he was started from in less than three days afterwards. I have known deer to be chased by dogs from Black River Swamp to Santa Swamp, a distance of from twelve to fifteen miles, and be back again in less than a week. M. F. H.

PHILADELPHIA, August 22, 1878.

EDITOR FOREST AND STREAM:—For many years prior to 1876 I have passed some weeks in each year camping in the Maine wilderness with a friend or two and the necessary guides, enjoying not only the bracing and delightful recreation that camp life affords, but with occasional "red letter days" with rod or gun; that were enjoyed with the zest of a clean conscience, vigorous appetite and good health—such as properly belong only to true sportsmen.

In the fall of '69 or '70 two friends and myself started on our usual trip, when we spent some weeks among the Schoodic Lakes, in the eastern portion of the State, and though we had but a limited amount of good sporting luck, we enjoyed every moment of the trip most thoroughly. On this occasion the man whose name is attached to the article in your issue of Aug. 15 was one of the guides to our little party, and as guide or hunter is not excelled by any one in that State. But, all the same, it is to just such experts as he is that the whole sporting fraternity are indebted for the wholesale game spoliation of the Maine forests of their game; and it is the acts of just such men that caused the very stringent game protective laws to be passed, and which, if my memory is correct, forbid the killing of moose until after 1880, or the export of any caribou, deer, or grouse that are killed in the State.

Now, here is the reason for my assertion: In the trip in question when Mr. Darling was one of our guides, he told the writer, as did his brother George, who was with us in a similar capacity, "that in the winter of the deep snows, a few years prior to our trip, he and his brother killed upward of 80 deer without using a shot—running them down on snow-cuts, cutting their throats, taking off their hides, and leaving the carcass lying where it was killed." The hides, having a small cash value, were "brought out of the woods in a shebang." Again, this very same person, with another whose name escapes me for the moment, but who lives or lived on the banks of Cold Stream Pond, near Treat's Mill, in Enfield Town, killed, a winter or two previous, in the Aroostook region, upward of eighty moose for their skins alone, which reached the tannery in due season. There are hundreds others whose lust for gain has been so strong that they have lent themselves to the destruction of nearly all the wild animals in that grand old State. Her tens of thousands of acres of forest, scores and scores of magnificent lakes, and miles of rivers and streams should afford delight to the heart and hand of the sportsman. Now her wildernesses have not a tinge of the wild life in them that they are entitled to and would have but for such wanton destruction.

The Game Law of Maine is very stringent, and I for one hope most most vigorously enforced, that her woods and waters may once again be full of wild life. No doubt the guides do most seriously desire to have these game laws altered. If I understand it, they are reasonably well enforced, and being so, it materially interferes with their profits. Any tinkering with it, no matter whether deer are run with dogs or not, would, in all probability, make an opening sufficiently large to permit rapacious men to step through it at their pleasure.

R. R. R.

WARRENSBURG, N. Y., Aug. 19, 1878.

EDITOR FOREST AND STREAM:—I have been a wonderer since this thing has been brought up in your columns before. Mr. Darling's thirty years' experience in hunting deer ought to make him a competent judge on any defect in a game law protecting them; also thoroughly acquainted with their habits and actions both when they are unmolested and after being driven by dogs. I think, from his writing, I should not differ from him. My experience has been short, compared with his, it having been only ten years since I commenced hunting them, but have hunted with men who are good deer hunters—two of them have hunted in the Adirondacks every year for nearly fifty years. They have killed deer at all times, with dog and without. My opinion is the same as theirs—that deer driven by dogs as soon as they can elude them by swimming rivers or ponds, or wading small streams, they lie down to rest, and when night comes go back to the place they started from, or its vicinity. Have known of several instances when deer have been started three successive days in the same place, being driven each time two or three miles. On Sept. 2 a very large buck was pursued by dogs across the Boreas River, and followed up the stream, wading and swimming, and at times running on the bank of the river, until he had gone over two miles. The second day after he was started from the foot of the same mountain and took the same route. The next day he was killed, being started from the same place, and making the same race every time. We have a deer near Warrensburg—a doe. She has been here since last winter. I will warrant she has been driven to water by hounds once a week for fifteen weeks, always starting from the same place, and she can be seen almost any day in the same field in which she was first seen last spring. I could mention other instances that have come under my observation when there could be no doubt about it being the same deer that would return when night came.

Another point is, that no man can kill as many deer when there is snow on the ground with a dog as without, if he is a good hunter. The last time I hunted deer with dogs there were eight in the party, and six hounds; four of the hounds ran two races per day for six days. We killed four deer, all we saw near enough for a shot, and that number is as many, or more, than parties will average in a week's hunt, I don't care how many dogs they have.

Deer never run long. About the first thing they look for after being started is water, in which they hope to throw their pursuers off their track, and they almost always do it. But when on snow they are all-butted (that is, hunted without dogs) the hunter finds the track, and follows cautiously until he finds his game. If he is an ordinary hunter, and even a third-rate marksman, he seldom misses his deer. In the early part of the winter this is the way most of our deer are killed. Market hunters, some of them, kill, in good hunting, a few to seven in a day.

Then comes the butchering season (when deer are worthless, both the meat and the hides, the latter part of winter and early spring. The first crust that comes upon the snow, it is impossible to go into the Adirondacks without hearing how deer are being slaughtered on the crust. Some use dogs, others take their gun and snowshoes. They never hunt for single deer, but always go for a flock. As is generally known to sportsmen when snow is deep, deer get together where young hemlocks and laurel are plenty, and yard there like sheep. The snow gets packed hard in their yards, and they can get about to feed as well as in the summer; but when they are forced by their wholesale butchers to vacate their yards, and are chased by them until they can run no longer, then they are shot or the dogs kill them. Two years ago I was reported (and I don't doubt it) that some of the Adirondack guides would kill a deer and deliver the saddle for one dollar. This butchering in spring, and floating on ponds in summer evenings when deer are with young, is what is ruining our deer, and if not stopped, soon will entirely destroy the deer in the Adirondacks.

Our game law prohibits hunting deer with dogs. In my opinion, and every man without exception that knows anything about deer that I ever talked with agrees with me, you may hunt deer with dogs as long and as much as you choose in the fall, say from September to December, three months, and they will increase. It is the spring and summer shooting that is destroying them. All the law we want is something that can and will be enforced to protect them at that time. It cannot be done with the law we have now. If our law prohibited the sale of venison after Dec. 1 by the sale of it, I mean shipments from the country market so there would be no sale for it after Dec. 1, that would in a measure stop still hunting in December; as it is now more deer are killed that month than the three preceding, because the law gives one month to dispose of their deer they take advantage by hunting almost to the last day for market, and it is very easy to say the deer were killed in season.

Then, again, some of the city gentlemen who are so earnest in their endeavors to sustain a game club (in the city) for the protection of game, when they are making laws are guides to help kill deer for them, but use all means in their power to kill all that can themselves, and that too in summer, when nearly every deer they kill destroys one or two others. This is the class of sportsmen who will invariably and who are always crying with a loud voice, "You must not do deer," when they themselves do more harm in a single summer night than they could do in a week's time in the fall with dogs.

I say, have them stay at home a little more, or remember it is their duty to help encourage this protection of the game, and not the destruction and annihilation. There are a few city sportsmen who are in the woods in the summer months who would refuse to hunt deer with a jack lamp, and do all they can for the preservation and protection of game. I mention city sportsmen, because guides depend on them for their support and would not hunt unless paid by them. I should like to hear from others on this subject.

A. H. THOMAS.

The Rifle.

PROVINCE OF QUEBEC RIFLE ASSOCIATION.—Concluding Day, Aug. 17.—Strangers' stakes; small bores at 800, Snider's and Martini's at 500 yards; rounds, seven; P. Schwartz, 39, first prize. Ladies' stakes; 600 yards for Martini's and Sniders, 900 for small bores; R. G. D. Booth, 43, first prize. Small-bore champion match; rifles any, 1,000 yards, fifteen rounds; W. A. Jamieson, 65, first prize. Consolation match; 200 and 500 yards, five shots at each range; Private Morrison, 43, first prize. Quebec Volunteer Champion Match; five rounds at 200, 500 and 600 yards; won by D. Turnbull, first prize, with 65. Frontier Stakes; 500 yards, seven shots; first prize, Lieut. Col. J. M. Gibson with a full score of 35. The City Stakes; 600 yards, seven shots; won by Shaw with 29. The Battalion Match; teams of five, 500 and 600 yards, seven rounds at each range; won by the Montreal Garrison Artillery, with 215. Three Rivers Battalion making one point less. The Macdonna Match; ten rounds at 500 yards; first prize, Lt. Col. Gibson, with 44. The Association Match; teams of five, 500 and 600 yards, five rounds at each range; won by Richmond Rifle Association, with 177. The Military Match; five rounds at 200 yards,

standing, and 400 yards, kneeling; first prize, Corporal Coppin, with a score of 44. The Wimbledon Team. The following are the successful marksmen in the competition for representatives of the Province of Quebec at the Wimbledon (Eng.) meeting of 1879: Capt. Thomas, Fifty-fourth Battalion; Sergt. Riddle, M. G. A.; Pte. Wynne, Fifth Royal Fusiliers; Lieut. Vaughan, M. G. A.; Major Mudge, P. W. R.; Sergt. Wardill, P. W. R.; Pte. Ross, P. W. R.; Capt. Balfour, Eighth Royal Rifles, Quebec; Sergt. Orr, P. W. R.; Pte. Ross, Sixth Fusiliers; Sergt. Harcourt, P. W. R.; Sergt. Meadum, V. V. R.; Capt. Boyd, Fifty-fourth Battalion; Lieut. Campbell, V. V. R.; Pte. Wilson, Fifth Royal Fusiliers; Capt. Thompson, Fifty-fifth Battalion Metic; Pte. Turnbull, P. W. R.; Pte. Rowand, V. V. R.; Corporal Allen, P. W. R.; Corporal Currie, Sixth Fusiliers.

AUGUST AMATEUR SERIES.—Boston.—200 yards. We give the leading scores:

O. N. Jewell.....	5	4	5	4	4	4	5	6	45
N. F. Frye.....	5	5	4	4	4	4	4	5	45
J. E. Lord.....	5	5	4	4	4	4	4	5	45

O. Marshall.....	5	4	4	5	4	4	4	5	45
H. B. Southern.....	4	5	4	4	4	4	4	5	43

Walnut Hill Range, Aug. 19.—No-clearing match; distance, 200 and 200 yards; possible 35:

O. M. Jewell.....	5	4	4	4	4	4	4	4	29
J. Jordan.....	4	4	4	4	4	4	4	4	28
C. U. Melges.....	4	4	4	4	4	4	4	4	28
O. M. Jewell (re-entry).....	3	5	4	4	4	4	4	4	31
J. Jordan (re-entry).....	4	4	4	4	4	4	4	4	28

Boston (201).—Seventh renewed competition in long-range match at 800, 900 and 1,000 yards. The weather was all that could be desired up to 1,000 yards, when it came out bright, with a change of wind, followed by a cloudy sky. In the scores we give, those having a star were shooting for places on the American team. Both the scores made by Messrs. Gerrish and Jackson are admirable ones.

The shooting was the best on record, excepting the American team at Creedmoor on the second day of the international match, they making on the first day 1938, and on the second day 1277, while the six gentlemen yesterday made 1267. Mr. William Williams's splendid showing of 218 out of a possible 225 equals Capt. W. H. Jackson's superb score made last season, and the largest ever made on Walnut Hill, and only surpassed by Mr. Bruce at Creedmoor, and Mr. Selph of New Orleans, who each made 219, the largest scores on record.

Boston and METROF.—Metrof.—Teams of six, 30 shots each man, 200 yards. Won by Boston with 755; Metrof, 652. The highest score was made by N. W. Arnold with 132.

Boston and ATTLEBORO TEAMS, Aug. 19.—Teams of nine men, 30 shots each man, 200 yards. Boston team, 1,103; Attleboro, 990. Highest score made by J. B. Osborn, of Boston team, with 129.

MEDFORD AMATEUR ASSOCIATION.—Bellevue Range, Aug. 25.—Third match of the August series; the scores made at the 200 yard range are as follows:

Cushing.....	4	5	4	4	5	4	4	4	26
Hayes.....	4	5	4	4	4	4	4	4	26
Rames.....	4	4	5	4	4	4	4	4	26
Howard.....	4	4	4	4	4	4	4	4	26
Ames.....	4	4	4	4	4	4	4	4	26

Scores made at the 400-yard range:

Osborn.....	5	4	5	5	5	5	5	5	32
Sawyer.....	5	4	5	5	5	5	5	5	32
Whittington.....	5	4	5	5	5	5	5	5	32

SPRINGFIELD vs. HOLYOKE.—Springfield, August 23.—The second contest of the rifle club of Springfield and Holyoke City, and the Holyoke Rifle Club, having teams of six men, took place at Williamette to-day, and was won by Holyoke by the close score of 250 to 249. The distance was 200 yards, the strings ten shots, and the shooting off-hand. Holyoke was also victorious in the three contest, and, therefore, wins the match.

CONNECTICUT.—Stamford, Aug. 24.—Match at 300 yards:

J. H. Swannett.....	5	4	4	4	3	3	3	4	43
W. H. Sanford.....	4	3	4	4	4	4	4	4	35
G. F. Hendrie.....	4	3	4	4	4	4	4	4	35

The California Sensation!!

DR. W. F. CARVER,
OF CALIFORNIA,

THE CHAMPION RIFLE SHOT OF THE WORLD,

Having so far a half interest in his Phenomenal Rifle Exhibitions during next season throughout Europe for the sum of
\$25,000,

is open for engagements to give Exhibitions of his Wonderful Shooting on Foot or on Horseback, or both, throughout the United States and Canada, until Christmas, when he visits California, proceeding to Europe in the Spring.

Dr. Carver will engage to shoot Glass Balls at from twenty-one to thirty yards rise, while riding bareback at full speed, upon his famous

BUFFALO HUNTING AND TRICK HORSE "SURPRISE,"

jumping hurdles and fences, breaking the balls while the horse is in the air! He will ride bareback any wild or untrained horse that can be forced into a run, breaking a glass ball while the horse is at full speed!

Dr. Carver is the originator of Glass Ball Shooting with a rifle, and is the only man in the world who shoots Glass Balls. Coins from a Trade Dollar to a Three-Cent Piece, or any minute object thrown into the air, with a rifle. He is the only man in the world who shoots Glass Balls from a horse's back, the horse running at full speed!

At Oakland, Cal., in December, 1877, Dr. Carver broke 1,003 glass balls with a rifle, missing but seven out of 3,000. At Oakland, Cal., in January, 1878, Dr. Carver won his Champion Horseback Badge by breaking 50 straight balls, horse running at full speed. At New Haven, Conn., June 13, 1878, Dr. Carver broke 1,000 glass balls in 72½ minutes, with Winchester rifle. At Beacon Park, Boston, June 29, 1878, Dr. Carver broke 100 glass balls in 4½ minutes with Winchester rifle. At Brooklyn Driving Park, N. Y., July 4, Dr. Carver broke 100 glass balls in 3½ minutes with Winchester rifle. At Brooklyn Driving Park, N. Y., July 13, Dr. Carver broke 5,300 glass balls in 7 hours 34 minutes with Winchester rifle. In performing the latter feat he raised to his shoulder over eighteen tons more weight and broke 500 more balls in the same time than did Capt. Bogardus when attempting to break 5,000 glass balls with a shot-gun. Dr. Carver stood firmly on his feet throughout the trial, while Capt. Bogardus was compelled to shoot a portion of the time seated in a chair.

FOLLOWING IS A PARTIAL LIST OF HIS SHOTS AT FLYING OBJECTS WITH WINCHESTER RIFLE: Shooting glass ball, the gun upside down, the shooter lying on his back over a stool. Shooting 50 glass balls out of 100 thrown into the air, with a Winchester rifle. First shooting with a Winchester rifle—breaking 11 balls in 3½ seconds. Shooting glass balls thrown 21 to 30 yards high. The Wonderful Hip Shot—Shooting glass balls without sighting, holding the gun on the hip; this the most wonderful of all fancy shots. The Lateral Double Shot—Breaking two glass balls thrown into the air at the same time, making a double shot, and loading the gun once while the ball is in the air. Shooting glass ball thrown from a distance of 30 yards straight at the shooter; this is one of the most difficult shots that can be made. The most wonderful shot ever made at a flying object with a rifle—Shooting a glass ball thrown into the air 24 to 30 feet high, missing it with the first three shots, loading the gun three times while the ball is in the air, and breaking it with the fourth shot before the ball reaches the ground. Shooting at and hitting a brick thrown into the air, reloading the gun, and hitting one of the flying pieces. Shooting lead pencils thrown into the air. Shooting coins thrown into the air—trade dollars, 50, 25, 10, 5 and 3-cent pieces.

The following challenge, issued by Dr. Carver Dec. 12, 1877, has never been accepted: I will wager from \$20 to \$500 that I can beat any man in the world shooting the following matches, or any one of them:

1. I can break 1,000 glass balls quicker with a shot-gun than any man living.
2. I can break more glass balls from a horse's back, the horse to be on a run 21 yards away from the balls, than any man in the world can break at 30 yards and stand on the ground.
3. I can break more glass balls with a rifle, the balls to be thrown in the air, than any man in the world can break with a shot-gun and shoot 30 yards, using a 15 yards trap.
4. I can break 100 glass balls quicker with a Winchester rifle than any man in the world can break them with a shot-gun.
5. I can break two glass balls thrown in the air at the same time, making a double shot, loading the gun once while the balls are in the air, using a Winchester Rifle.
6. I can make more fancy shots than any man in the world.
7. I will wager \$1,000 that I can kill no 6 buffalo in one run, shooting from a horse's back, than any man in the world; and if buffalo are not to be found will about six, and go on the prairie at any time.

Parties wishing to contract UPON A CERTAINTY for Dr. Carver to give one or both of his wonderful exhibitions—on foot, on horseback or both—for one or more days, or to shoot over a circuit for a stated period, please apply for terms and dates to

E. C. HAYNES, Agent,
No. 835 ARCH STREET, PHILADELPHIA, PA.

The following challenge, dated Aug. 19, was issued by Dr. Carver, and published in the New York Sun, Aug. 20, 1878, and the money deposited. It has not as yet been accepted: Permit me through the columns of the Sun to accept three of the challenges of Capt. A. H. Bogardus, and to challenge him for four more matches with shot-guns. The matches I have accepted are as follows:

1. To break 80 out of 100 glass balls, distance 30 feet, the balls to be thrown straight or picked in the air a distance of from 15 to 30 feet.
 2. To shoot at a target for \$50 a side, distance 100 yards.
 3. To give Capt. A. H. Bogardus 500 broken balls in 1,000, the articles of agreement and the money to be deposited with the Winchester Arms Company.
- I further challenge Capt. Bogardus to shoot three pigeon matches for \$300 each and the Championship of the World. The first two matches to be shot at 21 yards, 100 birds each, two traps, boundary 80 yards, under Prairie Club rules. The third pigeon match to be at 100 single birds, 30 yards, five ground traps five yards apart, boundary 31 yards; English rules to govern. The man winning two of the three to win the badge of championship of the world, the stakes to go with each match. I also make the following glass ball challenge to Capt. Bogardus: To shoot eight hours from traps with shot-guns, the man breaking the most balls in eight consecutive hours to win the match. The man to be shot for \$250 a side and the glass Ball Championship of the World, each to shoot with one or more guns; everything to be equal. The shot-gun matches to take place between Nov. 15 and Dec. 15. I name St. Paul for the first matches, as Capt. Bogardus and I both spent there one week the first of September. The money to be deposited as forfeit before the 1st of September in the above-named place. The man refusing to shoot at the appointed time to lose the amount of forfeit. I have deposited the articles of agreement and forfeit with Parker Bros., 91 Chambers street.

DATES FILLED UP TO OCTOBER 12, 1878.

Sportsmen's Goods.

SPECIAL NOTICE

TO

GENTLEMEN.

We have just received a direct importation of East India novelties, to which we desire to call attention:

- 1st. 25 pieces pure Corah Silk, a delicate fabric, of soft, creamy shade, which we sell by the piece.
- 2d. 25 pieces real Seersucker, which was made in narrow stripes expressly for us. We shall make suits to order, and keep in stock. Back Coats ready made during the month of August.
- 3d. Chogas.—A few of these fine embroidered Camel's-Hair Smoking Jackets for gentlemen, such as we offered two seasons ago.
- 4th. 25 pieces Pure Pongee Silk. These silks, made into suits, we offer as the coolest and most attractive summer garments for gentlemen ever shown. Price only \$11 per suit.
- 5th. 50 sets of Pijamabs and Cobias—or East India Sleeping Dresses. These were made to order in Canton, and are very handsome and desirable, at same time inexpensive. Last season we sold the suits at \$15. This month we offer them at \$9.
- 6th. 30 pieces genuine old fashioned Nankeen. This we sell by the piece or make to order into suits for gentlemen or children.
- 7th. A few dozen East Indian Silk Sashes, to be worn with Children's Summer Suits. These are very fine in quality, but very cheap. Price \$2.

The Parker Gun

Simple in Construction. Durable and Effective in Action.
FIRST PREMIUM AND GOLD MEDAL AT CENTENNIAL EXHIBITION.

Endorsed by the Leading Sportsmen as being the American Gun for American Sportsmen. Send stamp for new catalogue, edition 1878.

PARKER BROS., 97 Chambers St., New York.
From the Champion Shot of the World—it affords me pleasure to recommend the Parker Shot-Gun as being a very safe, durable and excellent shooting gun. Having shot it in many of my exhibitions, I find for rapidity in loading and firing, and the extremely long shots made with it, it cannot be excelled. The principle of the break-off, and the manner of opening to insert the shells give it a decided advantage over all other breech-loaders. The rapidity with which I have shot this gun is due to the construction, enabling me to break the gun open and cock both hammers at one motion, which cannot be done with any other breech-loading shot-gun. Wherever I have shot this gun it has attracted great attention by the extremely long and difficult shots made with it. I shall always take pleasure in recommending your gun, and shall continue to use it in my exhibitions. Yours truly,
DR. W. F. CARVER, San Francisco, Cal.

Sportsmen's Routes.

Chesapeake & Ohio R.R.

The Route of the Sportsman and Angler to the Best Hunting and Fishing Grounds of Virginia and West Virginia.

Comprising those of Central and Piedmont Virginia, the Ridge Mountains, Valley of Virginia, Alleghany Mountains, Greenbrier and New Rivers, and Kanawha Valley, and including in their varieties of game and fish, deer, bear, wild turkeys, wild duck, grouse, quail, sheep, woodcock, mountain trout, bass, pike, pickerel, etc., etc.

Guns, fishing tackle, and one dog for each sportsman carried free.

The Route of the Tourist

(through the most beautiful and picturesque scenery of the Virginia Mountains to their most famous watering places and summer resorts).

The Only Route via White Sulphur Springs.

Railroad connections at Cincinnati, with the West, Northwest and Southeast; at Gordonsville, with the North and Northwest; and at Richmond and Charlottesville with the South. All modern improvements in equipment.

IRA A. PAINE'S FEATHER FILLED GLASS BALL.

PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD and ONLY BALL MADE TO A SCALE, therefore we would respectfully caution the dealers against laying in a stock of unsuitable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than is charged for other inferior balls. No other ball affords the PLEASURE of the Feather Filled Ball, and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 500. Send for price list. Special index to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

Bogardus' Patent Rough Glass Balls
and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8. Old style, \$6.
Parties buying glass balls will receive, in each barrel containing 250 balls, score book and rules for glass ball shooting, containing 40 pages.

HEADQUARTERS FOR BALLS, HAGGERTY BROS. & CO., 10 Platt Street, N. Y. City.
FOR TRAPS, HART & SLOAN, Newark, N. J.

ROD AND BOW

THE AMERICAN SPORTSMAN'S JOURNAL.

Terms, Four Dollars a Year.
Ten Cents a Copy.

NEW YORK, THURSDAY, SEPTEMBER 5, 1878.

{ Volume 11.—No. 5.
{ No. 111 Fulton St., N. Y.

For Forest and Stream and Rod and Gun Fishing on Lake Superior.

No. 1.

"Forth upon the Glitche Gumes,
On the shining big-sea water,
With his fishing line of cedar,
Of the twisted bark of cedar,
Forth to catch the steed of Nahma.
Alise-Nahma, king of fishes,
In his birch canoe exulting,
All alone west of Hawatha."

THE excursionists of the steamer Keweenaw, who left Cleveland on Thursday, July 11, for a trip around Lake Superior, spent Sunday, the 14th, at Mackinac, in the full enjoyment of its pure bracing air, its delightful drives and charming views, and on the morning of the 15th started for the Sault St. Marie. As a party of fishermen were just preparing to visit their pounds, some twelve or fifteen miles distant, we concluded to accompany them and see the *modus operandi*, notwithstanding it took us several miles out of our direct course. We accordingly took in tow the tug and sail boat belonging to the party, and in an hour or two arrived at the fishing ground. The pounds are constructed at a considerable distance from the shore, with which they are connected by a long net or lead, coming in contact with which the fish follow it up until encased in the pound, from which they are unable to extricate themselves. The pound itself is a large seine or net-work fastened to stakes driven in the bottom of the lake, and is suspended from them at a depth of several feet beneath the surface of the water. Arrived at the pounds as yard after yard of the net was raised into the boats, bringing into view only here and there a stray herring or a small-sized whitefish entangled by the gills in the meshes of the net, we began to think it a water haul, and not worth the detour we had made in order to witness it. But as the bottom of the net was neared, a struggling, plunging mass of scaly beauties came into sight, and were shovelled by the fishermen into the boat. The catch was almost exclusively whitefish, of splendid size and unrivaled flavor, as we soon had an opportunity of testing, our caterer having availed himself of the occasion to lay in a supply for the steamer. I may here remark that there is no fresh-water fish, and but few of the denizens of the salt water, that can compare in flavor with the whitefish of the northern lakes, especially when taken from the clear cold waters of Huron or Superior and transferred to the table within a few hours after his capture.

Having laid in our supply of fish and waved a farewell to our fishermen friends, we steamed away for the Sault, where we arrived on Tuesday morning, the pound after having tied up for the night at a landing a few miles below, the channel of the river being in some places too intricate and dangerous to venture on during the night.

The first view of the Sault St. Marie is picturesque and novel. The seething, roaring turmoil of the waters of the St. Mary River, as they dash with arrow-like swiftness down the rapids, nearly a mile in extent; the Indians in their light birch canoes engaged in taking "whiting" in the struggling mass of angry waters at the foot of the rapids, and the Canadian town away in the distance across the river; while just at hand, on the other side, is the American city, with its costly and elegant ship canal, now being expensively improved by the government, and its general air of activity and business, and its numerous vessels passing to and fro through the canal.

We had looked forward with considerable interest to our arrival at the Sault, as it was to be the beginning of our trout fishing experience on Lake Superior, and were no sooner on shore, than, having engaged a couple of Indians and a canoe, we put across the river, at the foot of the rapids, to try the fishing in the streams on the Canadian side. The pull across the river, which is here exceedingly rough and boisterous, on so frail and insignificant a craft, and with a crew so inexperienced; and while attended with no real danger, is yet, apparently, so hazardous as to make those of weak nerves or unaccustomed to the water heartily wish themselves ashore. Indeed, the trip across the river just below the rapids, which I made twice, was, to me, much more animating and exciting than the ride down the rapids, which is regarded as the thing to be done by all visitors.

Having trolled unsuccessfully across the river in the hope of striking a trout or, possibly, a Mackinaw salmon, the *Nanawagoose* of the Indians, which we were informed were taken here, we put up our trolling tackle, and, with light fly-rod in hand, began the ascent of what we then supposed to be distinct streams entering the St. Mary's River from the back Canadian country, but which we ascertained about dinner time, as we emerged into the broad stream above, to be only small branches of the St. Mary passing around islands and mingling again with the main river at the foot of the rapids.

In vain, however, did we try all the allurements we were masters of to entice the speckled beauties from the swift waters of the rapids, or the occasional more quiet pools we encountered. In vain we changed our flies, and at last resorted to the Indian expedient of attaching a worm to a fly-hook, all, however, to no purpose; and, disappointed at length, we returned to the steamer with some dozen or fifteen small fish, none of them half a pound in weight.

On our return to the steamer we made the descent of the rapids, which, though pleasant enough, was not up to what we had been led to expect from all we heard concerning it. Late that evening we left the Sault, and about midnight passed Whitefish Point, and entered on the broad bosom of Lake Superior. As we write more especially with reference to the fishing of that region, we will pass over the many pleasant and interesting incidents otherwise connected with the excursion; the visit to Marquette, Bayfield, Prince Arthur, etc., not to omit mention of Duluth, of the Mesabe Sea, made famous by Proctor Knott; the visits to iron mines, copper mines and silver mines; the excursions of our enthusiastic geologists, and the havoc they made among the sandstone, granite, quartz, traps, etc.; the gathering of agates along the pebbly shore, where we all became children again, and splashed barefoot up and down the beach, and scratched in the sand and gravel until abundantly satisfied with the curious and beautiful specimens we had gathered—all of these form delightful reminiscences, and will long be recalled with pleasure by all of those who were so fortunate as to participate in them.

It becomes us, however, to make especial mention of the obligation we were all under to Prof. Nelson, of Delaware College, Ohio, for his very entertaining and instructive lectures on geology. But to return to our fishing: As to the fishing along the south shore and northwestern shore as far as Prince Arthur's landing, it may be summed up in the general statement that there is no trout fishing worth naming, or such as to justify persons in stopping and exhausting their time and patience in the capture of such few small fish as are likely to reward their efforts. At every landing we made we essayed the trout with unvarying want of success.

That in the less frequented streams, as a distance from the towns, good fishing might be had I have no doubt; but in none of the streams within a day's journey of the ordinary stopping-point of the steamer is the fishing worth seeking after. More or less small trout may be taken in all of them by using a short rod and a few feet of line, with a lead and bait, but no place where you can fly fish with any expectation of a return at all commensurate to the toil and labor incurred.

But while this is true of trout-fishing, some other kinds of fishing are to be enjoyed in great perfection. We will many of us long remember Pigeon River and its extraordinary pike-fishing. Be it understood, however, that the fish taken was not a pike at all, but the same fish known generally in the Cincinnati markets and throughout the West as the Ohio salmon, or jack salmon. It is a salmon, either, any more than a pike, and has no resemblance to either except in the elongated head and dental arrangement, which might be remotely suggestive of the pike.

The fish was the *Luciperocera* of the ichthyologists; but as scientific names seem almost as unreliable as common ones, to believe this latter euphonious title has had to give way to the uncouth one of *Silatesodon*—the fish being a true perch and not in any manner allied to the pike or the salmon family.

When our boat came to anchor in the bay off Pigeon River (which, by the way, is the boundary line between the United States and Canada), understanding that there were extensive falls and rapids a mile or two up the river, we took our Indian and canoe and started with the view of ascending to the rapids and trying for the trout.

Throwing over our trolling tackle as we ascended the river, when about a mile above its mouth and a short distance below the rapids, in water ten or twelve feet deep, our trolls were struck simultaneously, and on drawing in we found on each a fish weighing about three pounds.

Though satisfied that they might be taken in numbers in that particular locality, we were at the time intent only on trying for trout farther up among the rapids, and not regarding *Luciperocera* as game under the circumstances, we passed at once to the falls, where, having fished faithfully for an hour or more without a rise, except from a stray pickerel, when in the absence of trout no doubt thought himself justifiable in picking up any flies lying around loose, and who himself was picked up in consequence, and being informed by our guide that he had never known trout to be taken in the river, we put up our fly rods, and rigging up a couple of bass rods with artificial minnows, determined to try back down the river for the mis-named pike. As I fully expected, no sooner had our trolls reached the locality where we encountered the fish on our upward trip than they were again voraciously taken, and two fine fish brought to hand. After this the biting was fast and furious, and in an hour we had, perhaps, twenty fish, varying from two to four and a half pounds in weight.

The hour having nearly arrived for the departure of the steamer, as announced by the bulletin at the office, we hastened to reach her; but finding that their plans had been changed and that the steamer would remain all day, we informed others of the locality of the fishing, and during the evening a hundred or more fine fish were taken. The fish were so voracious and eager that they would often seize the troll when merely dropped quietly over the side of the canoe as you would a bait. I am fully satisfied that had we gone early in the morning provided with proper bait, or even without bait, we could in a few hours have taken hundreds of them, the fact being that they bit so eagerly that it in a measure destroyed the sport, and an hour or two was as long as one cared to take them.

I may here state that these fish seem to abound in all the

larger rivers along the north shore. A day or two after our Pigeon River experience, while accompanying my wife in a canoe for a mile or two down the Keweenaw River, we took several of the same species.

When returning in the afternoon to the stream from the mouth of the river I directed my Indian to pull for a short distance along the shore of the bay, and in so doing took a Mackinaw salmon, *Salmo amethystus*, of two or three pounds weight, a fish that for symmetry of form and brilliancy of color rivals the speckled trout.

Sault St. Marie, August 1.

THE BOW AND QUIVER.

BY EDITHA.

THERE are so few healthful recreations in the open air of which women can partake without being charged with encroaching upon the domain of the "lords of creation" and incurring the imputation of being unfeminine, that it is not to be wondered at that archery should be rapidly increasing in popularity among our countrywomen. Besides its beneficial effect upon the health, too, it is an elegant amusement, developing as much grace as can be displayed in actual dancing, far more than the modern sleepy quadrilles or the indolent glide. Before going into the merits of our subject, a slight sketch of what is known of the bow and arrow in all ages may not prove wholly devoid of interest to my readers. There is no entirely authentic history or tradition relative to the invention of the bow. Plato ascribes it to Apollo, by whom it was communicated to the Cretans. The first mention of it occurs in the book of Genesis, xxvii., 8, 1700 B. C., where Isaac bids Esau take his weapons, "his quiver and his bow," and go into the fields to get him some venison. Ishmael, also, we read in Genesis xxi., 20, "Grew and dwelt in the wilderness and became an archer." Indeed, repeated allusions to this ancient weapon of the Jews occurs in the Old Testament: Jonathan presented his bow to David (I Samuel xviii., 4); "The archers hit and sore wounded Saul" (I Samuel, xxii., 3) 1055 B. C. Astor, of Amphipolis, has been slighted by Philip, King of Macedon, at the siege of Methone, 353 B. C., shot an arrow, on which was written, "Aimed at Philip's right eye," which struck it and put it out. Philip threw back the arrow with these words: "If Philip takes the town Astor shall be hanged." The conqueror kept his word. In the Greek mythology, and in the ancient Grecian and Egyptian sculptures, are various allusions to, and delineations of, the bow. Records of archery have also been traced in many Persepolitan, Macedonian and Parthian antiquities. The Chinese had this weapon. One of their proverbs says: "When a son is born in the family, hang the bow and quiver at the gate," and their great sage, Confucius, wrote a treatise on archery.

All the eastern nations seem to have used the bow as a weapon of warfare, and practiced archery as an amusement in times of peace. In Persia equestrian archery was much practiced, and shooting at the popinjay was a favorite recreation. The Arabs were skillful archers. In Chinese Tartary both sexes were equally expert in the use of the bow. The Manilla Indians, the Caribbee Indians, the Demerara Indians, the natives of Florida and the tribes of North America, as well as South America, all were very expert in the use of this weapon, though of course, at the present day, it has been superseded to a great extent by the most approved fire arms. The Scandinavians were likewise expert archers. Homer makes numerous mention of the bow. In his *Iliad* (v. ix., l. 162) Pandarus is thus described, aiming an arrow at Menelaus:

"Now, with full force the yielding horn he bends,
Draws to an arch and joins the doubling cord;
Close to his breast he strains the nerve below,
Till the barbed point approach the circling bow;
TV impatient weapon whizzes on the wing,
Sounds the tough horn and twangs the quivering string."

He mentions the Locrians as being

"Skilled from far the flying shaft to wing."

Again, in the *Odyssey*, we find the stories of Penelope vainly endeavoring to bend the bow which Ulysses had left at home; and the hero himself, disguised as a beggar, having obtained permission to compete with them, thus proves his skill:

"One hand aloft displayed
The bending horns, and one the strings exerted,
From his essaying hand the string, let fly,
Twangs short and shrill, and shrill and lowly cry."

Athena, too, is made to introduce archery when celebrating the anniversary of his father's funeral. We read that the armies of Alexander the Great were chiefly composed of archers. Plato, who was a great advocate of archery, and was desirous that qualified persons should be appointed by the government to teach the youth of Athens this art, mentions that the standing guard of the city numbered among its force one thousand archers. Livy makes mention of the skill and prowess of the Grecian archers. Plutarch signifies the defeat of the Romans by the Parthians, and ascribes it to the manner in which the latter galled the enemy with their arrows. The Huns were likewise skillful archers. The Romans as a people were not skilled in the use of the bow, although many of the nobles and several of the Roman Emperors practiced it as an amusement. Herodian speaks of the

feats and the "unerring hand" of the Emperor Commodus, who exhibited his skill on the wild beasts in the amphitheatre. It is a disputed point as to the time of the long-bow's introduction into England. Some writers assert that it was the arbalest, or cross-bow, only which was used at the time of the Norman Conquest under the reign of Edward I. Prior to the battle of Hastings, when Harold and his two brothers were killed by arrows shot from the cross-bows of the Norman soldiers (A. D. 1066), there is no authentic record of archery being practiced in Britain, although some writers claim to be able to prove that it was in existence there previous to 440. The controversy was never settled as to whether it was an arrow or a bolt which slew William Rufus and which caused the death of Richard the Lion; and that the long-bow was not the cross-bow, was the opinion of the witnesses between Matilda and Stephen, and with which Richard made such havoc among the Saracens. Certain it is that that famous old hero of ballad romance, Robin Hood, who could

"Hit a mark at a hundred rods
And cause a hart to die."

would be divested of half the glamour of his name if we took from him the graceful long-bow and the "feathery arrow." Therefore, if not from stronger convictions, we side with the last mentioned opinions, that, although the arbalest may possibly have been the most common weapon of war, yet in the "merric green wood" at least the other was expertly handled. Ritson, in the "Old Garland," a quaint collection of ballads of Robin Hood (now scarcely to be found), gives the following characteristic anecdote of nearly the last words and actions of his famous outlaw. When he felt his end approaching he said:

"But give me my bent bow in my hand,
And a broad arrow I'll let see;
And where this arrow is taken up
There shall my grave be made."

At the battles of Cressy and Agincourt, the long-bow was evidently used. In the reign of Edward III, again we find express mention of our archers, to whom, indeed, the victory seems generally to have been chiefly owing in most battles wherein they were engaged. Sir John Smith attributes this not only to the skill of the archers, but to the "dazzling, be-mazing effect which a volley of arrows flying thick as hail through an army must have on the enemy's soldiers, and also to their horses."

In the reign of Edward IV, we find sundry curious laws relative to archery, to the importance of bow-staves, etc., in one of which "unlawful games, as dice, quills, tennis," etc., are prohibited, but "every person strong and able of body" is required to use his bow. Henry VIII was a great patron of archery; and a law made in his reign enacted that "all men not having any lawful impediment except religious and judges—under sixty years of age and an archer in the law—long-bows, and teach their children, servants, etc., having a bow with two arrows for each under seventeen years of age, and with four arrows for those above seventeen. Penalty, 6s. 8d. per month."

Queen Elizabeth, too, was a patroness of archery, and did not disdain herself to "wing the feathered shaft." By some statutes made in her reign, and that of the use of the bow formed part of the education of youth. At some of the public schools, and especially at Harrow, every parent was lealed upon to allow "to each boy a bow, three shafts, a bow-string and a bracer, to exercise shooting;" and prizes were given to be shot for by twelve competitors. Shakespeare, who, in his works introduces numberless allusions relative to this science, was, if we may credit any of the accounts of his mid-night onslaughts on the stage, an expert in archery. Charles I. was a practical lover of archery, as was his father, James I.; and by these two sovereigns commissions were issued for the purpose of preventing inroads on and removing obstructions from the public grounds and fields devoted to the practice of archery, for it would seem that brick and mortar were even then beginning assiduously to encroach on the "pleasant green fields."

Archery was neglected by James II, in the troubles of his reign; and after his abdication and the accession of a new family, bringing with them other predilections, the practice of it declined, and gradually fell into almost total disuse, being kept up only by a few companies or societies, among which the oldest and the one which survived the longest was the "Society of Finsbury Archers," who had records dating back as far as 1676. In Clerkenwell church is a monument to Sir William Wood, an officer in the wild marshes, who died at the age of 82. It has been restored by the Toxophilite Society. Part of the inscription runs thus:

"Long did he live, the honor of the bow,
And his great age to that alone did owe;
But how can art secure? or what can save
Extreme old age from an archer's grave?
Surviving archers wish his loss lament,
And in respect bestow this monument."

A splendid allusion is made to the Finsbury Archers by Catherine, Queen of Charles II, was by Mr. Constable—one of the oldest and few remaining members of that body—transferred to the Toxophilites, when he joined them soon after their formation in 1780, under the auspices of Sir Ashton Levers and Mr. Waring. That society was the parent of most of those which have since sprung up, and of late multiplied so rapidly.

George IV., when Prince of Wales, was a munificent patron of archery, and by his influence mainly contributed to make it fashionable, and thus reanimate it. Before leaving archery as a masculine accomplishment we must not omit that celebrated archer, Tell, who, when Gessler asked him why he took the second arrow, boldly replied—"But Tell has taken his place among the mythological heroes, so it is of no importance what he said."

It has already been mentioned that archery is peculiarly adapted to females, not so in the present day singular in that opinion. If we go as far back as the ancient mythology we find Diana with her bow; if we seek in the writings of the poets, we find Tasso's beautiful description of Cleveida:

"Her rattling quiver at her shoulder hung,
Therein a duff of arrows feathered well;
In her right hand a bow was bended strong,
Therein a shaft headed with mortal steel.
So it to shoot she singled out among
Her foes which of her wild marshes strength should feel;
So it at almost Latona's daughter stood,
When Niobe she killed and all her brood."

If we take a flight to Asia we shall find in some of the harems the fair slaves practicing archery in the gardens of seraglio. A traveler in Persia, we forget who, eloquently describes the bow of buffalo horn, black as jet and highly polished, with its richly gilded and enameled back, and string

of pure white silk, decorated at the ends with loops of scarlet and gold; the delicate and costly arrows, the sleeve of rich satin embroidered in gold, worn to protect the arm; and the jeweled thumb-ring (an article peculiar to the East) used by these beautiful captives, as well as the curious target composed of softened clay, at which they shoot. But we need not seek in the realms of the East, in the dream-land of poets or the superstitions of ancient idolaters, in order to demonstrate that archery has been practiced by females. Froissart mentions that it was one of the recreations of the stately dames of his day. Black Douglas, wife of one of the warlike and rebellious race of Douglas, was an expert archeress, and more than once, when besieged, tried her prowess on her own sovereign. Margaret, the daughter of Henry VII, is stated to have killed a buck in Alnwick Park with the bow and arrow. In the private purchases of Henry VIII, we find entered so much for bows, arrows, bells, braces, etc., for Anne Boleyn. Queen Elizabeth, as was already mentioned, must have been a quite a skillful archeress, for we find it recorded that on one hunting party she, "with her own hand, did shoot three deer."

Coming down to the reign of Victoria, we see that she was, when young years younger than now, disposed to encourage this elegant science, by the Highland Fete, at Holland Park, in 1850, added as a prize, expressly to be competed for by ladies in archery, a handsome and valuable bracelet. And so the progress of this elegant pastime has been through all ages and more or less popular in all countries. We come now to that part most interesting to Americans—reducing theory to practice—and this is rapidly being accomplished. The whole science or pastime is so very new in this country, and experienced archers so comparatively rare, that any well-grounded American authority is scarcely yet to be set up. The art cannot be taught by words; the theory and regulations must be given and certain directions laid down, the rest must be the work of practice by the archers themselves. Our old friend Roger Ascham, in his quaint language, ventures a very reasonable conjecture as to the reason why more has not been written: "The faulte was not to be layed on the language which was worthy to be written upon, but that the menne which were negligent in doyng it; and this is the cause thereof, as I suppose. Menne that used shottynge most, and knewe it best, were not learned—men that were learned used shottynge litle, and were ignorant of the nature of the thyng."

There are few, very few works on archery, and of these Hansard's Book of Archery, Hastings' British Archer, and Robert's Bowman, are perhaps the best. Bowyer and Smyth has his treatise on the bow, and the weekly journals in giving prominence and encouragement to what must in the near future lead all the outdoor sports of the more refined sort.

Fish Culture.

A VISIT TO THE FISH COMMISSION.

GLoucester, Mass., August 27.

EDITOR FOREST AND STREAM:

One of the most gratifying things connected with the work of the Commission this season is the interest that its work has awakened among the fishermen, as shown by their care in preserving specimens taken at sea and bringing them in for identification by the corps of scientists. Hardly a day passes without some rare form, never before known on our coast, or at least to this locality, being presented to them, and occasionally they bring something that is entirely new. This, in addition to the daily dredgings on board the *Speedwell*, will make the collection of 1878 as full of important results as any of the previous ones when the field was comparatively new.

The department of invertebrates, perhaps, exceeds that of the fishes in the number of new species, many of which may be of practical importance as furnishing food for the fishes and in determining relationships; still, science takes all forms into account, never questioning their practical value at the time. Professor Baird, however, is known as a scientific man with a practical side, and while the specialists are each at work in their own divisions he is planning to increase valuable species, or, by taking the charts and soundings, the depths at which certain species feed and the nature of that food, etc., to devise means whereby the fishermen may increase their catch.

There have been seasons here when the cod were unusually plenty, but the fishermen were unable to take many on account of the scarcity of bait, which they are obliged to get from Nova Scotia or Newfoundland. Mackerel are the best bait for cod, but are too valuable, and the herring comes next; but after being ten days on ice this fish becomes valueless and the cod refuse it; hence they must put back at the end of this time whether they have a full fare or not, and to try and remedy this Professor Baird has brought a new variety of gill-net, such as is in use by the Norwegian fishermen for taking cod, from which, if successful on our coast, a change may be wrought in this matter. He also has had a trawl-like rigged, with wire arms or spreaders every three feet, with a snood and hook on each end to determine at which depths the different fishes feed.

Since the announcement in FOREST AND STREAM of the discovery of the chimera there have been several reports of the two of them to-day fresh and dead, and the fishermen gather around them in wonder at this sudden apparition of monsters caught here where they have fished all their lives and never seen one. This singular looking fish has a shark-like form, but is largest at the head, which has, when seen in profile, a square, projecting nose overhanging a formidable mouth, which, instead of teeth, has the bones of the jaw projected into a cutting bill not unlike that of a moustache, and which is undoubtedly capable of taking a mouthful with a clean cut from almost any fish or other animal. Unfortunately these fish have all been devoured by the fishermen in order to preserve them, and it is therefore impossible to determine the exact nature of their food from their internal organization or the contents of their stomachs.

Another of the valuable "finds" is the *Alteporus ferox*, a fish with a long, scissel-like, serpent-shaped body about five feet long, and a head four feet in diameter when alive, but, having been ten days on ice in a fishing boat and in alcohol ever since, is now shrunken to about three, surmounted by a dorsal fin running nearly its full length and nearly a foot high, with a large forked tail and a narrow, formidable-looking head, whose sharp, scissor-like jaws are armed with keen, lance-shaped teeth, which vary in length from half an inch to an inch and a quarter, giving an expression not unlike those

old fossil bat-formed reptiles of pre-historic times called pterosaurs. Two of these fishes have been obtained, the first which have gladdened the eyes of a naturalist on this side of the water, although several have been taken in the waters near Madeira. Mr. Goode had proposed the name of scissor-mouth for the use of the fishermen, but waived this in favor of that by Professor Baird, who suggested lance-mouth as more descriptive. The generic name is from the Greek, and is formed from *a*, not; *lepis*, a scale; and *saurus*, a lizard, or a lizard without scales, while the specific one, *ferox*, refers to its ferocity.

The chimera resembles nothing more than the fabled monster, whose existence has long been considered chimerical, and reminds one of those hideous demons of the old sculptors, which they reproduced in the carvings on the capitals of columns, but the alteporus is like the sea-serpent! It looks like some of the pictures of it; and now that two of five or six feet have been found, why not one of forty? It is becoming every day more evident that there are not only more things in heaven and earth, but also under the sea, than are dreamed of in our philosophy—and who can put a limit to that? What a man does not know about, as a matter of course, he has no idea of; and what do we know of the sea? Nothing comparatively. The coast has been pretty well dredged around parts of Europe and in a few spots in America, and ships go across and see what is on the surface, and sailors are believed if they do not see anything that others have not beheld, but are treated as imbeciles or impostors if they do.

Please remember that I do not say that the alteporus is the sea-serpent, but if it were a few times longer than it is it would be no discredit to some of the descriptions, and these specimens may be young ones. A case in point: A small serpentiform fish, popularly known as a "ribbon-fish," and growing to perhaps three feet in length or so, has been long known; but a specimen was stranded in Bermuda that was over eighteen feet in length, and which was fortunately secured by Mr. J. A. Murray, of the Fish Commission, and sent to the British Museum for its flesh was used, and no specimens approaching its length have been seen before nor since. Taking these things into consideration, I am willing to believe that the half has not been told us, and therefore will not be so greatly astonished if some day the commission really does pull Leviathan out with a hook, or his tongue with a cord which they shall not need.

As the fishermen are not so well educated as they are on account of their being the most striking in appearance, and, in consequence, more attractive to the casual reader or visitor; but they are far from being the most important things that relate to the propagation of the food fishes. All things relating to this branch will be found in the report of the work, and one fact is so linked with another that to attempt to give a just idea of a work would be impossible within the limits of this letter. Your readers are already familiar with the nature of the commission and the manner of dredging, sounding and taking deep-sea temperatures; therefore, I will say that, having worked within the distance that the *Speedwell* could cover in a trip by daylight, the steamer is now voyaging longer ones, and Commander Beardslee left last night at midnight, in order to get on untired ground by morning, with the expectation of being back to-night.

In weather when it is not advisable to go to sea, the experts are busy in determining the characters of specimens previously caught and recording them. Messrs. Goode and Bean, assisted by Mr. Earle, are up to their elbows in the alcohol tanks a good part of the time, fishing out the undetermined, counting in-rays, measuring and comparing with recorded specimens, and determining the characters of the new species they live. There are tenfold more useless, destructive fishes in the sea than in fresh water, and if means could be devised to destroy them without killing the useful ones it would be of vast benefit. For instance, see the bull-heads or sculpins, *Cottus*, no valuable fish feeds upon them, and they being all head and stomach, are worthless as food for man, but I saw a full grown herring taken from the stomach of one who would not weigh three times as much as his prey, and who, if dressed, with his head off, did not contain as much clean meat as his herring.

I only mention the sculpin because it has just come under my notice; but there are dozens of other forms that perhaps served a purpose in checking the increase of the cod, herring, mackerel, etc., in time past, before the advent of man, but which, under the influence of man, has passed into a pest, and appeared as a balancing power, that in some cases—namely certain fresh water species—has been an overbalancing power.

The fishermen often throw these very destructive fishes back into the sea alive, but in order to maintain a more equitable balance they should be killed, and would then be destroyed in some proportion to the better sorts.

The absence of visitors on the steamers, and the expeditions this year, have been a great boon to the fishermen, and a great relief to curious questioners; and, judging from the character of the work thus far, it is safe to prophecy a series of results from the year's work that will be not only of great credit to the commission, but will ultimately tend to the benefit of the fisheries, and through them to the whole people.

FRED MATHER.

TURTLES AND EELS.—Holyoke, Mass., Aug. 30.—Editor Forest and Stream: With Mr. Roosevelt, we think that the mud turtle, the common spotted fowler, has been a sad disturber of our peace and destroyer of young fish. For several years, commencing in 1876, we were in the way of setting box traps for capturing turtles, baiting with a fresh fish, bait bit open, or the inside of a sheep or chicken, and placing trap in the shoals at head of pond. The water flowing through the box carries the smell of blood down into the pond. On going to the box in the morning we were frequently disgusted by finding the box full of mud turtles, leaving the snapping turtle out in the cold. We have frequently caught them in the same place, and found them eating of worms and dead minnows, when fishing for snapping turtles. We don't swear, but the mud turtle has often brought up some very hard thoughts about brimstone, etc. We should like, if in our power, to assist Mr. Roosevelt to the sight he so earnestly desires—mature eels going down stream. In the first place we would ask: Are there no eels in any of the Long Island waters? Are there no eels going any farther, for true to their nature, are they going of all sizes, by my small stream noted for eels will answer the purpose. A large stream would be too expensive to cover with netting. Mr. Roosevelt would have to provide himself with a waterproof suit, a good stout net to span stream, and a lantern. At the first heavy rain and wind storm of a dark night, on or after the fall of the leaves, and every storm after until frost sets in, he will find the eels moving. He will land the eels, and darker the night, the greater the fisherman's harvest. After the storm clears off,

* The long-bow was six feet long and the arrow three feet; the usual range was from 300 to 600 yards. Robin Hood is said to have shot from 600 to 600 yards, a Persian hero, Arash, is stated to have shot a much longer distance. The cross-bow was used to a stock and discharged with a trigger.

and the water begins to get clear, the run stops until the next storm, when the ice will move again. By holding the lantern close to the surface of the water you can occasionally see one pass tail first. In the same water we have helped to take several barrels full in a night, and for many nights in the season. We have caught them in early spring with hook, in the same stream, as plenty as if an eel had not left there the previous fall. The net will have to be visited, at least every twenty or thirty minutes, as we have known nets carried away from side stakes by the water of fish and leaves. Many eels will be found drowned in the net, while others are full of life and vigor.

THOS. CHAMBERS.

✧ **LOSS OF WHITE FISH.**—Madison, Wis., August 26.—*Editor Forest and Stream:* All the white fish in the hatchery at Milwaukee died during one night last week. There were a large number of them, many from six to nine inches long. They had been in the hatchery eighteen months, and were all alive and well in the evening and dead on the following morning. No cause is assigned for this loss. II.

Natural History.

For Forest and Stream and Rod and Gun.
CERVUS COLUMBIANUS.

SINCE this animal is but little known, and since there is a lack of information as to its habits and characteristics in the eastern part of this continent, I have thought that perhaps a few remarks made by a person who has been conversant with it for the past sixteen years might prove to be interesting.

The article concerning this species in Hallock's "Sportsman's Gazetteer" is a fair account of this type of deer, with this exception: that in the statement regarding the flesh being inferior in favor and quality to other species, the writer has certainly made a grave mistake. The contrary is the case, the flesh being quite equal if not in some respects superior to that of his white-tailed brother, *Cervus virginianus*, and undoubtedly much better than that of the wapiti or elk, *Cervus canadensis*. That of the moose, *Cervus alces*, is thought by some to be better, but others differ from them in this opinion. The black-tailed deer of the Pacific coast differs in appearance and size but little from the Virginian deer, and, to ordinary observers, both animals, if placed side by side, would be thought to be of the same variety, the only distinguishing characteristic being, as indicated by its local name, the black tail; and this appendage differs only in being black on its upper side from the root to the tip, being white underneath as in the Virginian deer. The coat is a blue one from about September till March or April, the rest of the year it is red. The white on belly and stern never changes. The fawns are spotted at birth with very distinctly marked spots of white, extending in parallel rows from the shoulders to the buttocks. These gradually grow smaller until autumn, when they totally disappear. Occasionally an albino is seen pure white, while others are marked with white spots or patches, and may better be described by the Spanish word *pinto* than any other that occurs to me. These cases are very rare. The islands lying in Puget Sound and the Gulf of Georgia produce more of these deer than any other locality, but this freak of nature occurs sometimes on the mainland.

The range of this deer in British Territory is from the 49th Parallel of latitude on the south to Alaska on the north, and from Vancouver Island on the west it extends a long distance eastward to the interior of the mainland. Its food consists almost altogether of browse, the boughs of the various coniferous trees, maples, etc., and the shoots of various sorts of berry and other bushes forming a chief diet. I do not think it is a feeder on any distinct kind of food, the fact that I have never seen it feeding on any of the native grasses, blue joint, red top and Timothy—to which it has access in many places; neither have I ever seen any of the said grasses showing signs of having been cropped by deer. A long hanging moss growing pendant from the Douglas fir (*Abies Douglasii*) and other trees, as also a wild vetch commonly known as pea vine are a favorite food. The circumstances under which deer may feed on grasses, but it certainly does not as a rule nor to any great extent. The size varies considerably in different places, and in none more so than on the islands before referred to, the average weight being very much more in some places than in others. The largest bucks are a trifle over 200 pounds, entrails removed, but in August and September, when in their finest condition, a buck 150 to 170 lbs. is considered a very good one. A fat doe in January, her best month, goes from 100 to 120 pounds. The rutting season occurs in different places from September to November, being entirely over in some localities before it has commenced in others, and the period of gestation is supposed to be about or in the neighborhood of six months. No positive authority exists on this point, however, as there are no deer parks here, and with wild deer it can, of course, be only a matter of approximation. During the subsequent rutting season the neck of the buck swells to nearly twice their ordinary size. Two fawns are produced at a birth; instances of more are related, but this is perhaps as rare occurrence as twins in cows. The fawns are sequestered for a time after their birth until they gain the requisite strength to follow their dam. They remain with her till late in autumn, when they separate and commence life "on their own."

These deer are not gregarious. Although occasionally a group of three or more are seen together, they are as a rule solitary. By this I mean that they do not congregate in bands like elk and deer of other kinds, and nothing has transpired to show or prove that they are migratory in the sense applicable to other species. Of course, as the snow comes lower on the mountains in winter they descend to the valleys, and the advent of their favorite food in the spring has the effect of making some move from their settled haunts, but nothing of the character of a general movement ever occurs. They are nocturnal in their habits, feeding chiefly early in the morning and late in the evening, and during the night about the period of full moon, and are rarely seen during the middle of the day, except when startled from their lairs, save at two seasons, namely: during rutting, when they appear to be continually on the rutting ground at night, period, when the bucks' horns are approaching maturity. They repair their open spots with a southerly aspect and bask in the sun, and this feature is termed by hunters "hardening of the

horns." The does are hornless. An occasional doe has been killed bearing the horns, but these cases are very rare indeed.

Whatever index is put on the horns of these animals may be to the age of the animal, in this species they are not to be depended on to any degree in this respect. Spike bucks are often obtained certainly more than the second summer old, and others with old grizzled heads and molars worn down to the gums, together with other positive signs of old age, bearing horns of not nearly the number of times that others of far less age bear; and the common idea or opinion of an additional tine for each successive year is wholly inapplicable to this species. The horns sprout from the head in the form of a knob, about March or April, and mature in August and September; they are dropped in December and January. They form quite a formidable weapon of offence and defence, and although severe fights occur between the bucks during their amours, still they do not appear to be as pugnacious and determined as other sorts of deer, as no instances are on record of interlocked horns and consequent death of both combatants. They rarely come to bay, nor do they make anything of a fight when caught in the water. The horns are cylindrical in form (slightly ovate), and the tines, with the exception of the brow antlers, proceed from the posterior part of the main horns, and they (the tines) but seldom exceed five or six in number. These deer are very numerous and do not recede before civilization to any great extent, as long as their cores are not destroyed, and apparently their numbers are not affected to any great degree by near proximity to settlements. As an example of this they abound within three to four miles of Victoria, the capital of British Columbia, a city of four to five thousand inhabitants, and in any direction within a radius of a mile and a half of this city—one of a thousand inhabitants—a deer can be started by a crowd about fifteen or twenty minutes from the time the horn is turned loose, any day in the year. Their sense of smell and hearing are very acute, and they appear to be more alarmed by an unusual noise, or getting the wind of, than by seeing a person, although they pay but little attention to the report of a gun, and sometimes as many as three or four are killed with a muzzle-loading rifle without the hunter stirring from his tracks. Why they should be so numerous may appear strange, taken in connection with the fact that the gray wolf (*Canis cynopterus*), their natural enemy and insatiable persecutor, is plentiful, is an object of veneration, and is never molested by the Indians of this vicinity; while also the gray and bay lynx (*Lynx canadensis* and *Lynx rufus*) depend on the deer to a great extent for stocking their larder, while the panther (*Felis concolor*) depends on the same almost altogether. But their numbers may be accounted for in this way: No epidemic such as is spoken of in other places occurs here.

Their gait is a three—a walk, a trot, but little faster than the walk, and a run, the latter better expressed by buck jumps, high bounds being made in the air at each leap. They are splendid high jumpers; a seven rail snake fence appears to offer no obstacle, while a five feet picket fence is rarely attempted, and affords security to the settlers from depredations on their crops. The modes of capture practiced here are still hunting, driving with hounds, fire-hunting, and shooting to a limited extent. Bleating for the bucks and crying like fawns to call the does are practiced by the Indians, who, here as in other countries, take the easiest method of securing food. A buck on the run can usually be stopped for an instant by bleating or whistling, but if not killed he is off the next minute like a shot.

New Westminster, British Columbia, May 10, 1878.

SWORD-FISH.

BRIDGEPORT, CONN., August 23, 1878.
EDITOR FOREST AND STREAM:

I have just returned from a sword-fishing excursion off Block Island, and have become very much interested in the habits of this fish, and in the manner of breeding, concerning which I am unable to find out anything. The fishermen here know absolutely nothing about the habits of the sword-fish except that he comes up to the surface periodically for the purpose of sunning himself. They also know that he is a migratory fish, because "he's here in summer and he isn't here in winter."

I have never seen a fisherman who ever saw a female, or who has ever seen anything which would any difference in sex. The smallest one which I ever heard of being caught weighed 46 pounds, the commonest size caught in Block Island waters ranging from 80 to 225 pounds, fish being occasionally caught as high as 450 to 500. These, however, are rare. I wish you would publish something concerning this curious fish in the columns of your valuable paper, as I am sure they would be appreciated by one of your readers as have ever seen one. The "Encyclopaedia Britannica" (1876, Fifth Edition), gives a somewhat meagre description of the fish itself and the methods employed in its capture in the Mediterranean, but says nothing of the habits of the fish, and does not even mention that it is found in American waters. Any information which you can give regarding their habits and method of reproduction will be very gratefully received by myself and several others. We had very good luck fishing, and in twelve and one-half days' fishing captured 13, varying from 34 to 326 pounds in weight.

E. H. HUBBARD.

We may state to our correspondent that the sword-fish probably never spawns on our coast. The only known spawning grounds are in the Mediterranean, and especially about the Straits of Messina. In the Mediterranean quantities of young sword-fish are seen from half a pound upward. None less than three or four feet long have ever been seen in the Western Atlantic, and these have lost the distinguishing character of the young fish, which have a high, sail-like fin the whole length of the back and a prominent spine on the operculum. The Fish Commission recently had a sword-fish from the coast of Maine, which weighed nearly 600 pounds, one of the largest with authenticated weight. The Cape Ann fishermen have of late caught many of these fish on their trawl-lines when fishing for halibut on the Nova Scotia Banks at a depth of 150 to 200 fathoms, an entirely new phase in the history of this species.

The sword-fish make their appearance on our coast off Block Island and Montauk from May 15 to June 1, and remain in the New England waters till early winter when the snow falls. Their presence seems to depend on that of their favorite food, the mackerel and menhaden, which they follow industriously. When the schools of summer fish dis-

appear the sword-fish also goes. It is impossible to say how far they are influenced by temperature, though it does not at present appear as if they were sensitive to cold. They kill their prey by striking it sideways with their sword. They must needs do this, because their toothless mouths are not adapted to seize and hold living struggling fishes. Mackerel and menhaden taken from their stomachs are usually marked with a gray stain in their sides, the effect of the blow of the sword. We may add that Professor G. Brown Goode is collecting material on the sword-fish, which will shortly appear in the "United States Report of Fish and Fisheries."

THE ENGLISH SPARROW IN AMERICA.

WE have hesitated to again open in these columns the long-voiced and very unsatisfactory discussion of the English sparrow question. Little real value attaches to a controversy where the recorded observations are often not of sufficient extent and thoroughness to be of practical bearing, and where the observers are themselves unintelligent in ornithological and scientific subjects. It would seem, however, that the sparrow has now been among us so long that a properly conducted investigation by competent experts would definitely and finally determine whether he is a useful ally against insects and worms, a merely harmless and neutral member of the feathered tribe, or a pest and a nuisance. To this end we most heartily endorse the plan proposed by Dr. Elliott Coues in the August number of the *American Naturalist*, in a vigorous article upon "The Ineligibility of the European House Sparrow in America." This proposition is: That "at the height of the insect season, at the time when the sparrows should be eating the bugs, if they ever do, in some places fairly infested with the bugs, a sufficient number of sparrows be killed and examined as to the contents of their crops. Let the authorities of any of our large cities—preferably Boston, where the birds are said to have done so much good, and where the sparrow combination talks loudest—furnish to proper persons, say five hundred sparrows, whose stomachs shall be examined by some competent botanist and entomologist together. If noxious insects should be found to form the greater portion or even any considerable portion of the food of these birds, I would yield the case as far as this particular count is concerned."

Such an investigation, repeated in different sections of the country, would soon settle the question and determine before it be too late what kind of a creature this is which we have so cordially received and now so jealously foster.

Dr. Coues has studied this question very thoroughly, and is outspoken in the indictment he brings against the sparrows. The charges of that indictment are substantially these: That the birds entirely neglect or insufficiently execute the work for which they were imported; that they harass and drive away more valuable native and insectivorous birds; that they already commit great depredations upon the kitchen, garden, orchard and grain field, and that, as their unlimited increase goes on, these depredations will assume more serious proportions; that they are, by reason of "their perpetual antics" in spring and summer, and their constant defiling of porch and window-sill, especially obnoxious and aggravating; and that, again, the condition of their life and increase being essentially different in America from that in Europe, they are out of their place here and have no part in the natural economy of the country; and, finally, that they threaten before long to become as serious a plague as are the grasshoppers and the potato bugs. While not prepared to advise extermination, Dr. Coues would recommend for checking their increase that the birds be left to shift for themselves, that the legal penalties for their destruction be removed, and that they be used as targets for the boys with shot-guns, and trapped for sparrow matches as pigeons are now employed by sportsmen.

Below we publish two communications upon this subject, the first from a correspondent in Milford, Mass., the second from Dr. E. C. Sterling, of Lake City, Minn.:

In I think, the current number of the *Essex* is an article on the English sparrow, the tenor of the article being against this bird, and citing the Nuttall Ornithological Club as authority for many statements there made, one of them being that the bird does not eat worms or bugs, etc.

As a friend of the English sparrow I would state an incident I witnessed to-day. In company with a friend, as I was leaving the office this noon, we saw one of a numerous flock of the sparrows fly to the butt of a large black walnut tree, some fifteen feet from where we stood, and begin to peck into a crevice of the rough bark, and start off with the bug I send you to-day in his back. We started forward quickly, causing the bird to drop it, and as it fell in a clear place near the sidewalk, we easily found it, and it being something never before seen, send it to you for name.

This is the second time I have seen sparrows taking bugs from the same tree. Once before this, last year, as I was passing along on the sidewalk, I noticed one of the birds in the street, say twenty feet from the tree, fly direct to the butt of the tree, and begin pecking at what I, after frightening off the bird, found to be a small insect, say as large as a deer fly, which was closely hidden in a crack in the bark.

If it is not good proof of the insect-eating propensity I could furnish more. I have also seen them picking up canker-worms on the sidewalk, and apparently eating them; and, passing two docks four times daily for some three years at all times of the year, I have never yet seen a right between the sparrows and other birds, although there were plenty of small birds of other kinds near by. A pair of the sparrows this year built a nest and reared a brood of young directly over my office in a ventilator hole in the brick wall, and never have I seen or heard any disturbance with other birds.

Several years since, before the sparrow was introduced into this town, we were overrun with canker-worms, so much so that houses near trees were black with the worms; and it was not an unusual thing for one, in calling at a house, to have the ring at the door answered by a servant with a broom in hand, to sweep away the worms from the entrance. This season it was a rare exception to see a tree eaten by the worms.

very handsome dog, and is a better all over. If he had a dark nose and eyes, like Fairy, he would be a grand animal. I think he will please a lot of people. I have no doubt of it. I will have a pup of his color. I think Ned's body color will please judges better by being smooth than gray, although I like a gray coat. If he gets a sufficiency of long hair, although he will take the eyes of judges. He is a very nice dog, and if his head does—that is, if his body grows and draws his rather heavy breadth of head—he will be hard to beat. I think I should try Victor again, and then the chance of a dark nose. Yours truly, E. L. YERGEN.

THE SHREK QUESTION.—*Editor Forest and Stream:* In response to your request for information in regard to bitches worrying sheep, I send you the following facts: The Hon. W. C. Hammett, of Howland, Me., once owned a magnificent black Newfoundland bitch, which not only killed the neighbors' sheep, but even her own master's, in the barnyard. She became so savage that her master was obliged to keep her constantly chained, and, finding he would be obliged to kill her, he possessed one of her pups to supply her place. One night, when the youngster was about nine months old, its mother succeeded in getting her head out of the collar, and, taking the pup, repaired to a small island at the mouth of the Sebobe, on which A. K. Roberts was pasturing a flock of twenty sheep, among which was a very large buck. Of these the two dogs killed fifteen outright, and mangled the others so that three of them had to be butchered, one ewe and the old buck alone surviving. The latter man such a gallant and desperate fight in defence of his flock that the bitch was unable to get home, and the pup was in nearly as bad condition as his mother. The havoc was at first supposed to be done by bears, but the tracks on the wet sand of the beach were clearly those of dogs, and on being followed up the culprits were discovered more dead than alive. Mr. Hammett promptly paid the damage, and as promptly immolated "Old Fenella," on the altar of his wrath. The pup was never known to go within a rod of a sheep afterwards. I can vouch for the above facts, but am bound to state that in the course of a long experience among sheep-killing dogs it is the only instance of a bitch attacking sheep that has ever fallen under my observation. PENOBSCOT.

Columbus, Nevada, Aug. 22, 1878.

PODSINSKY LOSES A DEAR LITTLE FRIEND.—*Editor Forest and Stream:* Enclosed in my old leather easy chair, in slippers, with my bow tie neatly tucked up, I sat myself down this evening for a quiet smoke, and opened the last number of the *FOREST AND STREAM* and prepared to enjoy the perusal of its columns. As I turned its pages I was pleased to find in the communication of "G. L. A." a sympathizing and congenial spirit. I was glad to see that a kindred soul appreciated my views on the intelligent companionship of dogs. I say to "G. L. A." I have no slake. But my sympathy is sad to-night, and "G. L. A." will appreciate and understand my sorrow when I say that one of my dearest little pets died last night. Poor little Prince! He was a lovely dog, and had been wont to curl himself up in my lap evenings as I smoked and read. A week ago he began to droop and pine, and looking up in my face with sad, meaning eyes, said: "I am sick. Can you not do something for me?" I took down "Stonehenge," and "Fallock's Sportsman's Gazette," and sought some remedy to fit the case, but could find no parallel disease of poor Prince's ailments. I tried various remedies, called in a friend of experience, but the disease baffled our efforts and the poor dog continued to get worse. Last evening I brought him in and laid him on the sofa, wrapped him in warm blankets. But he was restless, and groaned; and as I said to him, "Poor little Prince, what is the matter with you?" he raised his head, and looking up with his two large, lustrous eyes appealingly, seemed to understand that his end was near. About twelve o'clock he essayed to rise, and creeping into my lap, raised his head and tried to reach my face, which he licked, and placing his little paws around my neck, gave one convulsive shudder and fell back dead, with his eyes fixed on mine. Covering him up with a shawl, I sat the sad hours of the night through, and at sunrise buried him under a rose-bush in the garden. To-night I am sitting here sadly with a cloud of sorrow upon my heart. And how much I miss that little dog none who has not learned to love such a little pet can know. I shall miss his joyous bark of welcome when I come home at night, and his winning ways. He was only a little dog, it is true, but he loved me and I loved him. "How didst thou die?" I asked him sympathizingly, and he exclaimed: "I waste so much sentiment on you, my dear friend, that I die." "G. L. A.," say, I imagine, for he at least will appreciate my sorrow. It is true I have other dogs, and little Nelly bly is sitting at my feet, with beseeching eyes, trying vainly to attract my attention, and says plainly, "Let me take the place of poor Prince." But no, little girl; you are a nice little doggy, but you are not Prince—not to-night, Nelly. It is too soon. "G. L. A." will find papers to his initial address at the post office. FORDS.

San Francisco, Aug. 26, 1878.

INFLUENCE OF PREVIOUS SIRS.—From an exceedingly intelligent article in the *Live Stock Gazette*, we take the following:

With regard to dogs, some interesting facts have fallen under my notice, which may prove to be both useful and entertaining to those interested. I possessed a thoroughbred Collie dog and bitch; the latter had already littered several times, the puppies being thoroughbred. However, on one occasion, the bitch got lined by a mongrel greyhound, which was not a very good dog, and the consequence was that the next litter took place after the collie had been bred by the dog of her own breed. In due course of time she pupped, four of the offspring being black-and-tan, resembling the collie, while three were of the bluish color and build of the mongrel greyhound, impossible to mistake. The collie bitch remained in my possession for years after the time referred to, and was never mated again with any other dog than the collie, yet not one litter did she have offspring like the mongrel, but without throwing one or more pups bearing an undeniable resemblance to the mongrel. In conclusion, I may add that most stock-breeders know only too well, and often to their cost, that animals, whether mares, cows, sheep or dogs, will throw back; therefore, when I take into consideration the practical experience both of others and myself in such matters, I cannot agree with the comparative few who hold that "after the production of offspring from quadrupeds, no captivous influence of previous sires remain," as stated in an article in the *Live Stock Journal*, of May 10, by Mr. Frith, who also mentions an instance of a gray pony being served by a male ass, and subsequently by horses; after which he goes on to say that the foals got by the latter had no appearance of ass, but even the long ears. It has certainly come under my cognizance that in the mare and the mare after the ing mule foals, have thrown perfect horse foals; but these

instances do not disprove the well-known fact among a numerous class of practical stock-breeders, that the conceptive influence of previous sires most certainly and undeniably remains in almost innumerable instances to a very marked extent. GEORGE BRAMMONT.

SALES.—Mr. T. A. Fowler has purchased for Mr. John Gibb, of Orange, N. J., Dashi, a lemon and white pointer. Dash was one of the Boston prize winners.

SALE OF DREAM AND SEFTON.—J. Addison Smith, Esq., of Baltimore, has disposed of the pair to Mr. E. A. Willard, of Jonesboro, Ill., for \$500. Dream has been already shipped. Sefton remains with the Baltimore Kennel Club to be thoroughly broken. Mr. Amos Kelley has charge of Sefton, and he will have him ready by the 1st of December.

WHEELS.—*East Aurora, N. Y., Aug. 29.*—Mr. John W. Perry's Gordon setter Belle whelped four dogs, one bitch, Aug. 17, by Turk, formerly of Chicago.

Washington, D. C., Sept. 1.—C. L. Keller's orange and white setter Bird whelped to Duke eight dogs and four bitches.

NAMES CLAIMED.—C. L. Keller claims the name of Glenroy and Leonora for his black and white pups.

CRUISE OF THE NEW YORK YACHT CLUB.

(CONCLUDED.)

ALL day Thursday, Aug. 15, there was so little wind that the two divisions of the fleet, *Rambler*, *Dreadnaught*, *Estelle* and *Recreation* at Tarpaulin Cove, and the rest at Holmes' Isle, remained at anchor, their crews mostly engaged in fishing. In the evening was passed to get under way early next morning, and make for Newport again. The yachts in Tarpaulin Cove were up at half-past five Friday morning, *Dreadnaught* parting company off Cutty Hook to have some fishing. *Estelle* and *Rambler* kept on their course, and after a fair sail came in to Newport Harbor at 2 30, 3 30, and 3 40, respectively. The other division, under Commodore Kane, made sail at 6:50 A. M. the same day, with the wind light from S. W. and the tide on the last of the flood. *Volante* had *Recreation* and *Bugene* (Capt. Clarence E. Brown), lately added to the squadron, as her special antagonists. *Vixen*, *Regina* and *Active* formed another class by themselves, while *Vision* and *Grace* proposed tackling each other. Among the second class schooners were *Clio* and *Poam*, and *Intrepid* and *Restless*, among the keels. *Volante* was first to pay round; the rest followed close astern, excepting *Poam*, who was delayed some ten minutes. All set clubs and jib topsails. Passing West Chop, *Regina* and *Vision* were in the lead, with *Nereid*, *Active*, *Intrepid*, *Restless* and *Clio* close aboard, and *Madeleine*, *Vision*, *Bugene*, *Volante*, *Recreation*, *Grace*, *Poam* forming a second division. *Clio* drew ahead, but lost ground upon making a board to the southward, and it took her a couple of hours to make good the difference. The day was just one to suit her, though, and so she again came out ahead of the lot. Toward noon, when off Tarpaulin Cove, *Vixen* had worked out ahead, followed by *Regina*, *Vision* and *Clio*. To leeward were the *Nereid*, *Restless* and *Active*. The wind veered to the west and all light breeze, and the killing what there was of it. *Clio* got a streak of wind and closed up on the smaller craft ahead, but was led by quite a distance, passing the Sow and Pigs Lightship, by both *Vixen* and *Regina*. As soon as sheets were eased off, *Grace* seemed to be doing better, for she ran by *Vision*. On the wind they seemed pretty evenly matched, though *Grace* had a full bottom at the time. Both indulged in a luffing match, which was ended by *Grace* slipping through the other's lee after they had gone far out of their course.

Nereid in the meantime had chosen the passage through Wood's Hole and has a rapping tide to shove her along. She did so well that when the rest fetched into port they, much to their astonishment, found her quietly riding at her anchorage. *Clio* led at 5h. 45m., preceded by *Vixen* some 34m. 40s., *Regina* next at 5h. 45m. 30s., *Madeleine* 6h. 10m., *Grace* 6h. 10m. 30s., *Vision* 6h. 30m., *Intrepid* 7h. 30m., *Active* 7h. 40m., the rest not timed. *Regina* carried away her topmast, or she would have given a better account of herself. Commodore Kane informed Mr. Johnson Gilpin, secretary of the Citizens' Committee, that the club was compelled to decline the offer of a "Citizens' Cup," as the fleet would disband. The offer, however, would be kindly remembered by them. We have already made some remarks upon the position of this cup, and think that if the committee will follow our suggestions they will meet with a more satisfactory result next season. It was next day resolved to disband, and many of the yachts then went off cruising on their individual responsibilities. The commodore and officers have done much through their zeal in organizing and carrying out the programme so successfully to justify the congratulations they received upon the high water mark of their cruise. It was to be regretted that so little windward work was put in by the fleet, as nearly the whole cruise may be termed a sail down-hill, and the real qualities of the craft and their captains were called into play only to a limited extent. The sailing proved pretty conclusively that off the wind at least, the keel boats are craft not to be despised, and that among the lighter schooners *Clio* is hard to beat, while in the first-class *Estelle* must be considered about the best on an average. But we believe, as said, such tests as these were not but negro in their results. *Volante* deserves a word of praise for the plucky and persistent manner in which Mr. Robert Center tools her, and the conscientious way in which she accompanied the big fellows from first gun to last. If *Muriel* had shown up a little more company with others it would have helped solve the riddle of her speed, though just as it is, her hands and her paint hardly dry, no one will blame her designer or owner

from keeping aloof until she is in trim to enable her skipper to get all out of that there is in her. *Dreadnaught* is certainly to be classed among the fleet and fastest of our seaworthy schooners, and her equal is not in commission this year. *Intrepid* did very well, and came up to the intentions of her owner, for no one will deny but that she is a whole-some, able and fairly fast craft, just what was designed for. *Vision* never got into a seaworthy or *Grace* would have badly beaten her. *Active* proved herself smart and handy, and the *Regina* was exceedingly well handled, a fact, by the way, to which she owes much of her success. The cruise of the N. Y. Y. C. may well be pointed as an example for others to follow next year.

YACHTING NEWS.

NARASSET REGATTA.—*Mr. Editor:* The second Union Regatta of the Nahasset Yacht Club was sailed Saturday off Pleasant Beach, Cobasset, and was by far the most successful race of the season in our waters. The entries numbered one hundred and four, of which about seventy started. The day opened auspiciously with a light southerly breeze, and in an hour for starting they had increased more to the south and blew very fresh. At a quarter past one o'clock the preparatory gun was fired for the first-class centreboards and keels to come into line; and after a short delay, arising from the difficulty of getting so many boats into line, the second gun was fired for the start, and off they all went in a bunch, wind abeam, and lugging all the sail each one could carry. The second-class centreboards then took no time in getting into line, and were very promptly started after the larger class, many of them reefed and lagged over well before the breeze, which by this time was very fresh and squally. The third-class centreboards and second-class keels then came into line and were soon flying after the rest. These yachts all sailed the same course, which was nine miles in length and at times pretty rough, giving some of the smaller craft quite a shaking and preventing a number of timid skippers from completing the race. The first-class schooner class for very small yachts, of which there were a great many, and as they started on their short course in the shore, they looked from a distance as if they were all sail and no boat. When all were started the sight was as pretty as could be desired, and in fact the number of starters was greater than in any club race ever sailed here. Besides the racing boats, the bay was filled with larger yachts, some at anchor and some sailing over the course, and all full of interested spectators. The beach and all available points on shore were also lined with spectators, and the steamer *Rose Standish* carried a large party over the course. When the race was about half completed the breeze suddenly died away, and after several very uncertain puffs, came out very light from the southwest, and, as is usual in such cases, favored some of the yachts more than others, but did not materially alter the result, although it caused many of the smaller boats to explain why they did not win. The *Fancy* in the second class, and the *Psyche* in the third both lost their masts early in the race, the *Psyche* going short off at the deck. As both these yachts had hollow masts it gave those who do not believe in their strength a chance to crow. There were several minor accidents, but otherwise the race went off in a highly satisfactory manner, and owing due to the kindness of Mr. Towse, who kindly allowed his yacht to be used as judges' boat, and who welcomed the yachtmen and their friends on board in a most cordial manner. The times of the three leading boats in each class are given below. Judges: E. D. Peters, J. P. Hawes, Jr., A. A. H. Meredith, W. Lloyd Jeffries and E. H. Hawes.

FIRST-CLASS CENTREBOARDS.

Names.	Owners.	Unreefed	Length.
Fancy.....	Arthur Burgess.....	1 17 26	25 6
Folly.....	H. P. Burgess.....	1 19 63	25 6
Evil.....	T. M. Smith.....	1 23 15	25 4

FIRST-CLASS KEELS.

Clyde.....	Dillingham & Bond.....	1 23 18	34 6
Lotie.....	W. L. Andrews.....	1 23 18	34 6
Lotie.....	P. W. Webster.....	1 31 29	24 0

SECOND-CLASS CENTREBOARDS.

Scamp.....	John Bryant.....	1 16 45	18 0
W. Ter Wick.....	J. T. Huchers.....	1 17 37	19 0
Thelie.....	W. H. Hedges.....	1 19 26	20 0

SECOND-CLASS KEELS.

Fairy.....	C. A. Perkins.....	1 33 41	(7) 21 4
Unknown.....	J. G. Chauncer.....	1 34 09	21 2
Unknown.....	E. A. Hedges.....	1 35 23	21 2

First prize not judged until *Fairy* is measured.

THIRD-CLASS CENTREBOARDS.

Dolly Varden.....	A. B. Clevery.....	1 36 33	16 0
Besale.....	G. P. Upham, Jr.....	1 38 04	16 0
Seafire.....	G. P. Upham, Jr.....	1 38 50	16 0

SPECIAL CLASS.

Frolic.....	H. M. Knowles.....	1 07 03	13 0
Charlotte.....	Geo. Gattaway.....	1 07 33	13 0
Fiera Lee.....	C. A. Norden.....	1 10 55	13 0

BROOKLYN YACHT CLUB.—Owing to the paucity of yachts ready to join the squadron of the Brooklyn Yacht Club for the annual cruise, this event has fallen through. The yachts were to have met Monday, August 26, at Glen Cove, but only *Madeleine* and *Kate* were on hand. Commodore Wallack being indisposed, did not put in an appearance, nor was the flagstaff present. Word had been sent through the club's secretary to the vice-commodore to take charge, but nothing came of it. This is to be regretted, but we must confess the failure was not entirely unexpected. The date was fixed too late in the season. Most yachtmen had already taken part in previous cruises of the Southampton, Atlantic and New York yacht clubs, and the vacation of many was at an end. The calls of business were omnipotent, and but few craft could be gathered at the rendezvous. Moreover, others had left these latitudes and were scattered along the coast down East, unwilling to give up their private cruising for the sake of going over the same ground again within the narrow compass of the harbor. The result was that the club was left a little too tedious to do more than once or twice a season. The Corinthian spirit is seeking fields and pastures new, and will not readily be pent up within the set limits of a hundred miles or so of mill pond sailing. Which club will be the first to break the custom of a cruise up the Sound and show the stuff it is made of by changing its course next year and heading to the south?

THE YAWL RIG.—Great curiosity was manifested to see how the *Fancy* would sail in her new dandy rig, and she surprised everybody by the manner in which she behaved. It was said she never sailed so well before, and never looked better. The new rig is certainly very becoming to her and certainly very convenient. —*Pacific Life.*

BEVERLY YACHT CLUB.—The forty-third regatta of this club and the third championship regatta of the year will be sailed

HARD-WEATHER YACHTS.

HALIFAX, August 20, 1878.

EDITOR FOREST AND STREAM:

Permit me, as one taking a profound interest in the development of yachting on this continent, to thank you for your able advocacy of hard-weather yachts. I am glad to see the movement in favor of giving the English style of craft a fair trial in American waters, convinced, as I am, that before long it is not one, but a score of *Murcels* that we shall be showing our fleets "the way out." Harior sailing is all very well in its way, and racing in smooth water is glorious fun; you can bring out the highest speed of a model, sacrificing every other quality to that, and the catamaran is not a perfectly legitimate craft; on the contrary, I very much admire the ingenuity of its construction and the marvelous speed obtained, but I contend that the *Amargilla*, the *Tartanella*, the *John Gilpin*, *et hoc genus omne*, are not yachts in the true sense of the term. The fact is, we have, on this side of the water, got into the habit of calling everything that floats a yacht. I have known an open boat, rigged with spritmain and jib, entered in a regular yacht race. In England that would not have been tolerated, and the craft would very properly have been relegated to its own class of "open sailing boats." But I am not anxious at present to enter upon the difficult task of drawing the line of demarcation between yachts and sailing boats; my object in addressing you is to contribute what I can to the arguments in support of the deep model for cruising and racing in rough water.

I have opportunities of familiarizing myself with both the shallow and moderately deep types. Of the extremely deep types, such as the latest English racing craft are, I cannot speak from personal experience; nor do I fancy that anything like the *Christine* among the *forties*, or the *Alouette* among the *fives*, would suit me. There is a happy medium which will yet be struck by us if we are only wise enough to profit by the experience of our English brethren.

There are two or three points of belief in the yachting creed of this side of the Atlantic which bar the way to genuine salt-water yachting. One is that the centreboard is the equal of the keel for all kinds of work; another, that speed is the main object to be attained; a third, that the longer mast and boom, the more huge the jib, the more vast the mainsail, the better. We very aptly give to such much canvas into our working, or lower, sails as we can manage and as a necessary consequence, the moment it blows a single reef broeze our canvas yachts are in difficulties, and it takes a good hand at the filler, and another at the mainsheet, to pull the vessel through in safety. Sailing, under these conditions, becomes a series of jerks of excitement, and you are constantly wondering whether the next puff will or will not raise you. The sailor's chief task soon learns by practice the "length of the righting lever" of his boat; he may not get it to the first deck stroke, or, it may be, half way to the cockpit coamings, it is high time to luff sharp up if he does not want to turn turtle.

My own yacht is fairly entitled to the appellation of a "deep," seeing she draws six feet aft, while she is only thirty feet long. She is, compared with the shallower models which compose our racing fleet, slow in smooth water; but there is not one of these clippers which, if caught under a sea and wind, such as it was my fortune to be in a few weeks ago, but would halt if not altogether, down to the keel. The one which could stand the amount of hard weather my race-course will take comfortably. In this summer's cruise my two friends and I owed our lives, under God, to the fact that our yacht was deep, and carried her ballast so low that, with quick watching, she could be kept upright in a horribly bad sea that would have tripped and rolled over a shallower yacht depending wholly on beam for her stability. I have great joy in experiencing the difference between outside and inside work, and the value of having a deep draught yacht, such as that has a good "holy" of the water, can cut her way through a heavy head sea, and is snugly sparred and snugly canvased.

When fitting out this spring I was strongly advised by several yachtsmen, for whose opinions I entertain much respect, to give the craft a longer bowsprit and five or six feet more of mainboom; in other words, to increase her total area of sail by about a third. "She can carry it all, and more," was the end of all such recommendations; and no doubt she could in smooth water, but happen to catch an infinitely more for outside cruising than for harbor sailing, and my impression was that for the former purpose she had as much sail as she wanted. As it turned out she had too much for rough weather, and quite enough for fair winds, as I think will be admitted when I say we ran ten knots an hour before a freshening breeze under mainsail, gaff, topsail and spinnaker; this in a rough sea is good work for a yacht thirty feet long on the water line. So for the rough weather: We went out one morning, at the beginning of our cruise, under plain lower sail—mainsail and jib—a tremendous sea heaving in from the southward, and a cross chop bringing up with the northerly wind. Regular ocean sailing; nothing between us and the coast of Europe, so that we had the full benefit of the Atlantic surge. The wind piped up with fierce gusts that laid us right down till the cabin-top was awashed. "Reef down" was the order, and both reefs of the mainsail were hauled in, ditto the jib, and we spanked along, only to find after another hour had passed, that under close reefs she was over-pressed. We tied the jib down, showing only a few feet of the head, and even this rag of head-sail had to come in when we turned to for a whacking log thrash to windward, with the pleasing prospect, if the gale got much worse, to extemporize a drag, and ride it to. Fortunately, matters did not get as bad as that, and the good little ship claved right up under the lee of the land, and got into the smoother water of Ship Harbor, when we were able, though it still blew in violent squalls, to give her whole mainsail and jib. We rigged up a storm trysail in the next harbor we made, for we knew now that the snuggest of canvas may be unexpectedly required.

Perhaps I had better pipe "elay." This yarn has spun itself out, and knowing something of the mysteries of crowded "galeries" and in expensive "forums," I suspect my communication may be condemned to the waste-paper basket on the ground of undelugth if on no other. But it it escapes that fate, and is thought worthy of being placed before the yachtsmen-readers of FOREST AND STREAM, I shall ask you, sir, to "grant me of your grace" another chance to fill up a column or two on this subject of yachts for work as well as play. ROTOR-OBOIX.

ROSSMORE HOUSE.—This popular house, situated at Speonk, near Moriches, L. I., can be readily reached twice a day from New York. This season the Rossmore House has been remarkably well patronized, which fact is due to its pleasant situation, its excellent management, and the bathing facilities. Being located on Great South Bay, fishing and gunning can always be had. Address for rooms and terms Mr. S. P. Conklin, Rossmore House.

TAKE SOLID COMFORT.—You will find it in the easy chair made by F. A. Sinclair, Motville, N. Y., and advertised in our columns.

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$2; three months, \$1. To clubs of two or more, \$3 per annum.

Game Bag and Gun.

GAME IN SEASON FOR SEPTEMBER.

Moose, *Alces melchior*.
Caribou, *Tarandus rufifrons*.
Elk or wapiti, *Cervus canadensis*.
Buck or Va. deer, *C. virginianus*.
Squirrels, red, black and gray.
Hares, brown and gray.
Beaver, *Fiber zibic*, *Castor canadensis*.
Wild turkey, *Meleagris gallopavo*.
Himantopus, *Colaptes auratus*.
Cupulidius cupido.
Ruffed grouse or pheasant, *Bonasa umbellus*.
Quail or partridge, *Ortyx virginiana*.

Black-bellied plover, ox-eye, *Sylvia larula helvetica*.
Ring plover, *Erythrura semipalmatus*.
Sparrows, *Spizella americana*.
Song or long-shanks, *Himantopus nigricollis*.
Woodcock, *Philopelia minor*.
Red-breasted snipe, or dowitcher, *Macrophthalmus griseus*.
Red-ecked snapper, or ox-bird, *Tringa americana*.
Great marbled godwit, or marlin, *Limosa fedoa*.
Willow, *Totanus semipalmatus*.
Tattler, *Totanus melanoleucus*.
Yellow-shanks, *Totanus flavipes*.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limosa* or *Shore Birds*.

CANADA.—*Groenochurst*, Aug. 26.—The prospects for deer hunting this fall are very good. A number of bears have been seen around the neighborhood this month, and a few have been shot. J. S.

MASSACHUSETTS.—*Worcester*, Aug. 29.—Mr. Jerome Marble, with a party of about fifteen, start from here Monday night, Sept. 2, for Minnesota and Dakota Territory, on a two months' hunting. The gentlemen of the party are accompanied with their wives and families. They leave here in the excursion car, "City of Worcester," recently described in the *Forer* and *Steam*, which will be their home during their absence. They take with them the porter who has charge of the car, also the regular cook attached to the car.

Nantucket, Aug. 18.—There has been a large flight of curlew the past week; the largest bags were 30, 25, 18, 12.

NEW YORK.—*Marbleton*, Aug. 30.—Game is quite plentiful here. B. A. M.

LONG ISLAND.—*Jennia Bay*, Aug. 27.—On Sunday morning, during the storm, several large flocks of curlew passed over, going south. One small lot got detached from a flock, wheeled round, came down and made for the water and the east end of the bay, and being so tame that they flew close to a boat with a crabbing party in, that they fired their baskets (not their guns), expecting to capture the whole lot. Did not bear how many they killed with that shot. A few small flocks of small drakes have made their appearance. They do not stop more than a day or so. Coots are seen almost daily off Rockaway Beach.

MICHIGAN.—*Bay City*, Aug. 28.—I put in a couple of hours summer woodcock shooting near the city yesterday by way of a change from grayling fishing on the Au Sable, where I had been camping the week before. Drove out four miles in company with Sid. A. Van Dusen, proprietor of the Fraser House here, and beat three small cornfields near the bank of the Kawkawlin River. Took an hour before dinner and an hour or so after; the ground dried by the noontday sun and the worms deep in the moist earth below. Took no dog; flushed our own birds; walked up fourteen and bagged eleven as they rose the tassels of the corn. The heat was not great, the birds were strong flyers, and all young ones save two, which were beginning to moult. I never enjoyed summer shooting more. Had we taken the early morning we should have made a bag of twenty brace, as the field was well bored where the woodcock had worked. We beat up and down the rows, eight rows apart and abreast, pulling trigger when we sighted feather, for the corn was ten feet high in places. We shot 7-pound, 12-bore guns, with 2½ drachms powder and an ounce of No. 12 shot. The long-bills came to bag in fine condition, and no lead in the invoice.

I am disposed to bar the dog in cover of this sort where the birds always lie close; but the sportsman must be a good marker to gather all he drops. Where two shoot together they can assist each other greatly by lining the quarry from the point of firing.

The Fraser House is one of the best in Michigan, and enjoys a large patronage. It has just been altered and greatly improved. The dining hall is twenty feet high and of proportionate floor dimensions. Mr. Van Dusen, the proprietor, is one of the best still hunters and wing shots in the State, and the string of woodcock which we brought in was pronounced an unusually good one for this locality. We recommend corn as good woodcock cover, and advise sportsmen to examine fields more thoroughly than they are in the habit of doing.

HALLOCK.

Bay City, Aug. 27.—On Monday, the 26th, Chas. Hallock and S. A. Van Dusen, in four hours, flushed twenty-two woodcock, killing sixteen of same. How is that for high? GWSNE.

MINNESOTA.—*Hulokins*, Aug. 27.—In McLeod County and the two adjoining counties, Becker and Renville—pinioned grouse were never as scarce as they are this season. This is the more remarkable from the fact that the number of old birds on the prairies this spring were unusually numerous. I attribute "the failure of the crop" to the May freeze, which, I think, must have injured the eggs. Yesterday I went out and bagged only nine birds, seven of which were old ones, while in former years, in a shorter time, my count would be forty-five to fifty-five. The experience of all my friends corresponds with my own. W. O. E. B.

Rochester, Aug. 26.—Prairie chickens, I am told, are generally very plentiful throughout Western Minnesota, owing partially to the fact that the prairies were burnt off last fall to destroy grasshoppers, so there were no spring fires to burn the eggs. But little attention is paid to game protection in the western part of the State, and shooting began this year before the birds were able to fly one hundred yards. The quail crop in the eastern portions of the State is a good one, and in Western Wisconsin there are more squirrels than for years. VAND MONT.

THIS CRUISING CANOE.—No matter of what type, the regular cruising canoe should not weigh more than sixty pounds, and must be capacious enough to be slept in by her captain at night if desired. Anything that weighs over sixty pounds cannot be transported with facility by one man, or taken over a "carry." The cruiser should be alike swift under paddle and sail, and her rig readily handled. Strength, stiffness, elasticity, durability, and last, but not least, beauty and finish. If possible, the canoe should be unsinkable, through the introduction of water-tight compartments. White cedar is by far the best material for constructing a wooden canoe. It has nearly the strength of oak, and is much lighter, never warps, and can be obtained in clean lengths. A fourteen-foot canoe, built of oak, will weigh thirty per cent. more than one of cedar. Keel, keelson and timbers must be of oak, however, to retain the fastenings well. Stem and stern posts may be hackmatack or rock elm, deck of Spanish cedar, beams of yellow pine, and paddle should be flat-bladed and made of spruce. For sailing use a leeboard, without it no such leeway is made that it is a drawback to the canoe's efficiency under canvas when beating against the wind. The board need not be small, and could be made to stow snugly on the bottom inside, or on deck.

SPORTSMEN'S CANOES.—We have examined some open canoes for sportsmen sent to H. O. Squires, of Cortlandt street, by Rishelton, of Canaan, N. Y. They are of handsome model, very light, yet strong, owing to the proximity of the ribs. The latter are a marvel of good workmanship, and show the form of the boat to advantage. These canoes, though of light material, can stand a great deal of hard work and knocking about, and it is a wonder that they can be turned out for the low figure they are.

GREENPORT YACHTING GOSSIP.

GREENPORT, August 24, 1878.

EDITOR FOREST AND STREAM:

Business and pleasure of late have afforded me an opportunity for becoming pretty extensively acquainted with the whole eastern end of Long Island, and particularly with the vicinity of this beautiful village, and I am impressed not only with its beauty as a summer resort, but with its excellence as a place for sportsmen, not just now, of course, but in the "sere and yellow leaf" of the year.

The metropolis of it all, so far as the northern jaw, so to speak, of the open mouth of the eastern end of Long Island is concerned, is Greenport. The town is known to all yachtsmen, if to nobody else, as a point of rendezvous for the various clubs who annually cruise eastward from New York. They all like it, or at least all I have talked with, on general principles. However, one prominent skipper denounced slightly against the universal expression of admiration. "It would be perfect," he said, "only that it's so far upland. If you are coming westward from the Vineyard or Newport, why you can sail in very well, but if you generally happens, you have had a fair wind up the Sound, why then you've got a headwind all the way up here from Plum Gut; and if you want to take advantage of a favorable breeze down the sound you must lose a lot of time in slowly beating down to the Gut."

As usual, such yachts have been in and out all along during the summer, and here now, the New York Yacht Club had a regatta here early in the season and the Brooklyn Club later. The Atlantic Yacht Club only last week, and next week (Friday, Aug. 30), the Brooklyn Yachts were to assemble here again, but I believe their programme has been given up, as at the rendezvous at Glen Cove early last week only a few put in an appearance.

As one walks about the maple-shaded and cottage-bordered streets of the quiet, picturesque village, particularly in the evening, the number of beautiful eyes one meets is legion, and each fairer has a dainty bit of broadmouth on his arm; for the jaunty sailors are favorites with fair sex, who are usually, and the native swains must stand by and accept the situation with the best grace they can, sure that winter will bring its revenges, and when these batty foreigners are gone the summer of their discontent will be charmed away.

The schooner *Gladys*, the yacht of Vice-Commodore Hall, of the Brooklyn Yacht Club, left for Greenwich, Conn., some time ago, to remain over a day, and then go across to Glen Cove, where the Club was to rendezvous. The schooner *Comet*, owned by Mr. Langley, of the same club, left opposite the Manhattan Hotel, Shelter Island. The schooner *Osgrey*, of the Seavanhaka Yacht Club, is anchored near the *Comet*. Not far away lies John C. Cooke's trim shower *Prospero*, or old this morning, but I can't find her among the rest this afternoon. She flies the flag of no club.

Although not here at the present moment, mention ought to be made of the Brooklyn Club yacht *Sea Witch*, owned by Commodore Stott, in which Greenport feels a personal interest, since she alone, or all the boats outside the water here. Commodore Stott has a summer place on the shore of the bay south of the railroad station, and his boat white yacht, with its navy crew, may always be seen anchored just in front of his door, except when away on a cruise. Sometimes he illuminates her; sometimes fires volleys of salutes on very dark nights for the picturesque effect of the fire leaping into the blackness from the miniature cannon's mouth, while the echoes resound along the far shores, and are answered by courtesies from the guns of pleasure-boats across the bay; sometimes he sends a band of music ashore to play the other day the *Kate* was technically harassed by the same in port as well as while playfully cutting the line of his friends when there are several sleepy yachts here. On one of them—the *Kate*—I paid a half-hour's visit this morning at the invitation of her genial owner and commander, Vice-Commodore Randolph, of the Brooklyn Yacht Club. Her breadth of beam, in proportion to her length, is very great; consequently, she can make exceedingly fast time without dipping her rail. She shows a heel to most of her competitors, beating the *Kate* the other day, and I am somewhat after the latter has come off conqueror in a race from which the *Kate* was technically barred. Commodore Randolph, particularly pleased with her interior fittings, Commodore Randolph seems to be not only a gentleman of taste but of great practical ingenuity, and the way every inch of space was utilized, with the elegance of the whole, pleased me greatly.

Besides this, some sloops which belong here are to be seen in the harbor—the Rev. Dr. H. M. Sander's *Flora*, which flies the flag of the Atlantic Club, and the *Wendy*, owned by Mr. George Post, of Greenport. The *Wendy* and the John M. Sander's *Flora*, of Riverhead, was here yesterday, but sailed westward last evening. Mr. Winslow's sloop, *Arrow*, has just been called up on account of the recent death of the father of its owner.

So much for yachting news in this neighborhood. Every day the slender spars and snowy canvases of some new pleasure craft may be seen lying like a fair picture on the blue, calm surface of the bay, or scudding before a brisk breeze, while others disappear. Besides this, there are some of the old-fashioned "sloop boats," some of them very trim and speedy, which are cruising about, so that no lack of this element of beauty in a seaside picture, and endless opportunity of a day's or hour's sailing, at a moderate price, for those who enjoy it—and who does not?

JOHN CAMPBELL.

LEAVES FROM A DIARY OF WESTERN TRAVEL.

SOME five weeks ago a hunting party was made up in our office, and through the intermediation of the FOREST AND STREAM, the services of Mr. John Omohondro were obtained. We took great pleasure in reproducing the itinerary of this party—true hunters, every one of them. We beg to call attention to the terse, clear manner in which information is imparted. This is the way to tell a story. Fine writing is all good enough in its way, but mostly it is *non propter verba*.

RAWLINS, W. T., August 18.

July 27, 11:30 A. M. We started from here, but did not travel further than eight miles when we camped near a little creek. After dinner we took our guns, but without any success, except that I killed a couple of young sagehens. Elevation, 7,200 feet.

28th.—Left camp at 7:30; came at noon upon a plateau where the aneroid showed 8,200 feet. We made about eighteen miles, and got in camp at 3 o'clock, near Muddy Creek. We had a lovely place in a little poplar grove at the head of a spring. Near the camp the fish were scarce, and I caught only twelve little trout. Elevation, 8,100 feet.

29th.—Without moving camp we took our horses and rode some miles to another brook, where the fishing was so good that I filled my basket in a few hours. Frank and Jack tried to shoot antelope; fired several shots but did not kill any. The trout in this water are long and slim, large head, body silvery, with a bluish-black spots; belly is nearly red; very little game in them. There is another fish here which takes the fly like a trout. The form and color is like a small minnow; ventral and anal fins red, dorsal fin and tail yellowish, scales small and silvery; has a good flavor, but is full of bones; a kind of chub. During the eclipse I caught my largest trout that day, and when the darkness was over we turned home to our camp, where we heard bad news. Jack was cooking dinner, and during the eclipse, which both of them were watching, the fire went out, and the water and quilts caught fire, which, after some efforts, they extinguished. This accident was a good experience for us—not to make the fire too close to the tent again.

30th.—Left camp at 10 o'clock. After we had been riding about eight miles we saw at a distance two men on horseback, who took us first for Indians, but when they found that the mistake was made, they came on. Coming from Colorado, they were going north, about six miles from here, being a little tired of the hot sun; thermometer showed 85 degrees at the night before we had ice. We found here a splendid clear and cold brook, and expected good fishing, but no fish was caught, not even a minnow or chub. I think the water contained too much lime and alkali. In the evening five of our horses ran away about two miles, and it took all the skill of the guides to bring them back again. Elevation, 7,200 feet.

31st.—Soon after breakfast we all went out to kill some game for our dinner. Jack and Tip killed an antelope each, while Frank and myself wounded one each. I broke the hind leg of one, but my old Jimmy, being slow, could not catch him, and gave the chase up. After dinner we tried it again. Jack and I came in camp at 6 o'clock, let our horses loose, and I took the cartridge out of my rifle. When we were putting our saddles aside we saw four large buck elk coming down a canyon. We took our rifles and ran all speed to cut them off in a little cut-in in the mountain. Jack was over 100 yards ahead of me, when I could not run any more. I rested a minute, and then I saw Jack making signs to me to come up to him. I tried all my strength, and when on the top of the hill I saw three elk to the left and the big buck about 100 yards ahead of them near the creek, 200 yards from me. I put my Sharps to the shoulder and pulled, but no shot responded—I forgot to fire. Still the buck gave me time to do this, and then I fired, with what success I could not tell. He ran after a sudden jump over the hill and got out of sight. Meanwhile Jack fired several shots at the others, broke one down, which ran off again. When I climbed up to the top of the hill I saw Jack raising his gun at my big buck that had fallen down in the high grass, and tried to get up again; but he was so sick and weak, he could not get up. The guide broke one of his fore feet he sank down close to the creek, where a bullet through his head killed him. When he was lying there he looked at us angrily and showed fight. My bullet had penetrated the abdomen about three inches before his right hind leg, and very likely went through the bowels into the lungs. He was a very large buck, and Jack estimated his weight up to 800 or 900 pounds. His antlers are enormous, large and thick, and the velvet is still on. The guide said that they seldom saw such large horns in velvet. I felt proud, but at the same time a kind of sadness came over me for having killed such a large animal and not being able to make use of all the meat. We only took the loins, tongues and antlers. When we came to camp Tip brought a black-tailed buck home.

August 1.—We moved south about eight miles to the main branch of the Savory Creek. Here I found the trail of a small size; could catch more than we could eat. Frank and Jack went out shooting, and Frank succeeded in killing a fine antelope buck, whose horns he brought in camp as a trophy.

2d.—Tip and I took horses and rode up the creek about three miles, where I caught some good-sized trout, but not many; while Tip, during his fishing, caught by chance a young wild cat. Our camp was very dry, furnished with meat and fish, and for dinner our bill of fare showed elk, deer, antelope, trout, flap-jacks and coffee.

3d.—To-day, like the last few days, the thermometer showed between 80 and 90, while in the morning at 5 o'clock we found ice in our cups. It was too hot to go shooting or fishing, so we stayed in camp and put our things in the tents. In the morning we had a good wash, and in the afternoon we mended our clothes and soaked our raw pine of peace. After this hard work we took a nice cooling and refreshing bath in the Savory. Jack and Tip had looked out for the next day's camp. Elevation, 7,700 feet.

4th.—At five we got up, took breakfast at 5:30, and started at seven, and then moved about eight or ten miles south to the head of Savory Creek. The stream is small, rapid, and so are fish, which everywhere in this water take the fly readily, so that I could catch a mess at any time. While I was fishing, wading the stream and casting the fly into a shadowy pool, overhung by willow bushes, suddenly I saw a big old antelope buck standing within five yards before me without any fear, knowing very well that I could not kill him with my split bamboo rod, then walked slowly away. Nothing of importance occurred this day.

5th.—Game was here in great abundance, but as we had met enough in camp Jack and I took our horses and went out sight-seeing, but not very far. I forgot to take an aneroid with me. We climbed up very high mountains, and had magnificent views. The highest point we ascended was about 10,000 feet. When we came in camp we heard that Frank had killed an antelope.

6th.—The day was hot again, and we did not do much hunting or fishing. I caught some trout near the camp, and then Frank and I picked gooseberries, of which we cooked with sugar a fine preserve, which went first-rate with the fat flap-jacks we had for supper.

7th.—We moved camp and made a twenty-mile ride, which tired us out, as well as the horses. We had got into rough but more picturesque country; had to pass many high and steep mountains; sometimes it was not without danger to go down the steep canyons and slide down the rocks. At noon we had a short rest, and then we arrived at the head of two branches of Battle Creek in a lovely valley, which is surrounded on three sides, forming a triangle, by high mountains. We put our camp up near the junction of the two branches, both of them splendid streams, large enough for fly casting. We had scarcely put our feet on the ground when I made my rod ready to catch. Almost with every cast a trout of two line trout were landed. I never had a better trout fishing. The trout were so numerous that I could not stop fishing, although I had to put them all back, as we could not eat them all. Out of one pool, where the branches came together, I caught thirty-two trout, from six to eighteen ounces, without moving from my stand. The fish were delicious, and we had them cooked in three different styles.

[Concluded next week.] SOMMAUS.

EASTERN LONG ISLAND.

PERHAPS to the experienced traveler the journey across Long Island is not the pleasantest he might find among the various railways leading out of New York, although the quiet beauty of the scenery beyond the city would delight the eye of an artist; but to the man who loves to tramp, with ready gun and watchful dog, when the fields are brown in the autumn, and the leaves fall gently through the still, warm haze of Indian summer, all the latter part of the ride is attractive. He recalls the prairies as he glides across the level green plains of Hempstead, with its toy town of Garden City; then great fields of corn, which involves the universal verandah, remind him of the fond the quail would delight to hunt; and he forms an unuttered hope that the reapers will not glean too closely. At Farmingdale begins a close heather of blackberry bushes, etc., and after a few miles of this the road penetrates the boundary of that sterile and the scrub-oak region, which covers the whole interior of the island, and is not escaped this side of Yaphank station. The surface here is a level, open country, as a rule, as so scattered that you may look for miles ahead, while there is no such shadow as exists in a forest. Sometimes only a little thin grass covers the ground, which is carpeted by pine needles. But where oaks grow the ground is likely to be concealed under a continuous chapparral of tangled vines, briars, saplings and weeds, knee-deep, which makes grouse shooting (or partridge shooting as it is termed here) fatiguing and tedious. When you find the quail, you are likely to take the quick steps and sudden turns often demanded when a grouse is flushed. The range of pretty hills to the northward of the line of the road, known as the "Spine," used to be, and still is, a famous place for ruffed grouse.

It was in this dry, open country, where the berries and small acorns which they love so well were to be found in abundance, that I saw many more of the quail than in the plentiful flocks, rearing their young all over this central part of the island. It was known to the pioneers as the "heath hen," and they pursued it so recklessly that, as long ago as 1840, Giraud could find no trace of its presence, and put it down in his "Birds of Long Island" as extinct. If introduced once more and protected, no doubt the prairie grouse would thrive and increase in the central and central uplands. At Yaphank the eye is attracted by a stream, which the train shoots over, and which flows through a canyon of vegetation, as it were, the trees and bushes growing so directly from the water's edge that no bank can be seen at all. "Trout habitat that stream" is the mental comment as we rush by. There is no doubt they do, for we know that some of the best trout ponds on the south side are fed by its waters. For some miles more the road is a level, open country, wooded and swampy, black, isolated farms gleaming among the trees, out of which, perhaps, a startled bittern will rise on heavy wings and flap away in silence.

Riverhead passed, you come to the shores of Peconic Bay, and the region for fall duck shooting. Spring duck shooting does not amount to much here, but in the fall and early winter prime sport may be had. In each of the little half-farming half-forest lands along the shore of the bay, there are some one or two gentlemen who shoot more or less and who own creditable dogs; but the metropolis of the gunning, as of all other interests in this region, is Greenvale, the terminus of the Long Island Railroad.

It was my good fortune to make the acquaintance there of several gentlemen, fond of the gun and skillful in its use, who kindly posted me as to the prospects for good gunning in their vicinity during the coming autumn, and the best localities to be chosen by any one wishing to make good bags in sportsman-like fashion. Mr. Burt Clark, who may be spoken of (without prejudice to his comrades) as probably the most thorough sportsman in the place, says that he has not for many years known woodcock so plenty as they were in this region last summer. Just before the Fourth of July one man "dug up" six in a clump on Shelter Island, and Burt Clark says that even now, if one was to search especially for them, he could find forty in a single day's tramping. There is no good fall woodcock shooting in Suffolk County, and if summer shooting were abolished the effect would be to stop the sport altogether; still, a two weeks' later opening of the lawful season would probably be an improvement. Some parts of the south side of Peconic Bay afford good woodcock shooting, the outskirts of East Yaphank, for example. Burt Clark points out the "boss" spot of all, as well as for all sorts of snipe and plover.

Greenvale's "strong hold" is quail shooting. Besides Mr. Burt Clark and his brother John, there may be mentioned several others who are good shots; among them Mr. Clark, Sr., father of the two gentlemen alluded to above, John George, Captain Dana, and General W. W. H. Halsey. At Mattituck Ed. Betts shoots for market, getting, it is said, two hundred quail last fall; and at Belting Hollow, Wm. Youngs has the reputation of being the best shot. The farmers are disposed to make no objections to persons lawfully shooting on their lands if they are

well behaved and careful not to do mischief to fences or wound any of the valuable live stock, of which a large amount is wound in the county.

Greenvale sportsmen need not go far, but usually tramp eastward, the country there being more adapted to the birds, and at the same time easier to shoot over. Strangers coming here would do well to follow their example. In Oshamock—the neighboring township northwesterly—the outskirts of Dismal Swamp, and Brown's Meadows are good localities; also Queen street, Silver Lake, Long Pond, Albion's, Paul Brown's and Conklin's lands, and the neighborhood of the crossings. In East Marion, the opposite direction, D. G. Floyd's land, Sorel Pond, East Marion Lake, Birch Pond and Jerome's farm are favorite grounds. Shelter Island and Gardiner's Island, Montauk and outskirts of Sag Harbor also afford good shooting for quail, which are already piping loud and clear from the stone walls.

For grouse shooting the sportsman must go to the southern tip of the island, where a few shy miles west of Greenvale. Just around here there are not enough grouse to make good sport. Southeastward from Riverhead, however, they are said to be in plenty. Of course, there are some good dogs in this vicinity. Burt Clark kindly took me over to see his pups, the mother of which is his Irish setter bitch Linda, and the father, Schoonmaker's blue belton setter, Ben. They are all promisingly promising puppies. I mention, *ex passim*, Mr. Clark's valuable dogs, and the time he spends in shooting—batteries, boats, decoys and stools of artistic make and endless quantity, and the various other accoutrements of an enthusiastic sportsman. Other dogs which ought to be named are Captain Bennett's liver-colored setter, Mink, Heizmann's liver-colored pointer, Ned, and Aleck Wiggins' orange and white pure Irish setter, Dan, which I did not see, but which was represented to be exceedingly fine.

Having thus given the information likely to be of interest and value to sportsmen who are seeking a good place for game during the coming autumn, concerning the claims of the eastern end of Long Island to notice, only one thing remains to be noticed—lodging facilities. This is a matter of too much importance to be ignored. The most ardent and ardent sportsman gets tired and hungry; where he can best overcome both these and recommending a place for shooting it is important for him to know. All these villages have good taverns. It is hard to choose between them. I should say: "Avoid the 'summer' hotels." The best place, undoubtedly, here in Greenvale (which is likely to be the visiting sportsman's headquarters), is the Wyandouk House. I speak from a varied experience. Though Charley Wright is a sportsman, and the time he spends in shooting, he and the amiable "Mrs. Charlie" know how to take care of those who do shoot. As for getting here, two trains daily on the Long Island Railroad arrive at convenient hours, or you may take steamboats from New York tri-weekly, and from New London daily. The same remark applies to Sag Harbor, where I should recommend the Nassau House.

JOHN CARNEY.

FROM THE SEAT OF WAR.

WE arrived in Centralia, Mo., 3 P. M., August 14, and found ourselves in the midst of an immense grazing country; the best level prairie as far as eye could reach, broken only by hedges and small woods. When we got to Centralia we saw some half dozen wagon loads of hunters just starting out to get first shooting after the expiration of close season for chickens. Each wagon contained from four to ten men, and half as many dogs. During an hour or so spent in C., we saw a number of parties in wagons, on foot and on horseback, with their guns, dogs and, in most instances, campfires, and saw a third party of hunters on horseback on prairies farther north. We were informed by our sporting friends that recently all the best ground had been fenced in and posted, the owners combined in prohibiting all shooting; we therefore decided to start as quickly as possible and get as far north as we could away from railroad and towns before sundown. We procured a two-horse team and spring wagon for the day for the low rate of \$2 per day, laid in provisions for the journey, and started at 10 o'clock. It was necessary in case we had to camp, but the prairie was so small and contained but two rooms. To lodge three men in such a house, with himself, wife and five children, was crowding a little more than is always pleasant. We located two covens of chickens after sundown, giving our dogs a little to run. We were at them next morning as soon as we could see to shoot. The grass was high and wet, and the birds lay low, and it was not easy to get near them. The first covey was small and contained but two rooms. We located two covens of chickens after sundown, giving our dogs a little to run. We were at them next morning as soon as we could see to shoot. The grass was high and wet, and the birds lay low, and it was not easy to get near them. The first covey was small and contained but two rooms. To lodge three men in such a house, with himself, wife and five children, was crowding a little more than is always pleasant. replied, "Mr. —" "a." "What kind of a man is Mr. —?" "You'll find out when you meet him." "What does he build such fences for, they must be a great expense?" "To keep such fellows as you off."

He then informed us that he was the owner of the land, and was in search of a crowd of gunners from the town of Mexico, who threatened to defy him, and paid no attention to his signs of "keep off" posted on every alternate panel of fence. He threatened to shoot the first one he caught. "If it cost him \$1,000," and wanted to know if we belonged to that party. We hastened to assure him that we did not, but "were weary pilgrims from a far-off land—men of peace, gentlemen of honor, who would not steal his sheep, scare his cattle, nor shoot his dogs. We had spent the previous night at his neighbor C.'s house, and could vouch for us. We had traveled too far to be disappointed now, and we must get into that inclosure somehow. We were not pines nor Bess Tweeds in disguise, but were willing to buy. Could he not board us at his house? Was there not a hole of some sort in that confounded fence?" Finally, we succeeded in making a treaty, we agreeing to help him keep others off. He went with us and showed us where the chickens were, even when I killed a pair of them, he could vouch for us. We had then when we had to quit on account of the heat. The next morning our host went with us again. We had plenty of sport until about 10 o'clock, when it became too hot again. We could not prevail on our host to shoot, though he carried his gun all the time. He could not kill on the wing, and was much astonished at our breech-loaders and the way in which we knocked the birds down, especially on one occasion, when I killed a pair of the first rise, and then a third one that lingered long enough for me to reload and kill him. He showed the keenest appreciation of the working of our dogs, but could not understand why we would not shoot quail when dogs pointed them. When we parted he pressed us to come again, but I am not infatuated with chicken shooting. At the season when they will lie to a dog the weather is too hot to allow you to preserve your game, and too severe on both man and dog. As a game bird, I find them easy to hit and easily killed. No. 9 improved chilled shot does the business for them every time. A fair marksman with a good gun could not wish for easier game. BEDFORD.

St. Louis, Mo., August, 1878.

SALMON, TROUT AND DEER.

HEADWATERS OF THE MCCLLOUD RIVER,
NEAR SISSON'S, SISKIYOU CO., CAL., July 15.

EDITOR FOREST AND STREAM:

The McCloud is a glacial stream, flowing from the base of Mt. Shasta, a full-burn river, where it bursts from the ground, inclosed in canyon walls from 500 to 1,000 feet in height, roaring with a velocity of from ten to twenty miles an hour, and continually crooked. From its source to its mouth, near the United States Fishery, more than sixty miles, its icy waters are not warmed by the customs of civilization nor polluted by the flow of city or even country habitation. Apart from our camp at Horse-shoe Bend, the Indian alone dances on its banks and gathers to its fish-banks. From his conical bark hut, or poles covered with boughs, he sallies forth to the deep pools at every turn, and standing on poles, supported by crotches, hurls his forked spear, barbed with bone, through the salmon, and withdrawing his rude spear the barbed points remain, and by a strong cord attached the huge fish is drawn ashore. But we had no such unscientific appliances for taking our trout and salmon.

The Dolly Varden are found in this stream only, except in Alaska and the glacial waters of Mt. Hood in Oregon, and Mt. Ranier and adjacent peaks in Washington Territory. They are the Pacific red-spotted salmon trout, *Salmo campbelli*; but the Indians call them "Wye-ul-dicket." They are sometimes fifteen pounds in weight. But as a rare fish they had no special interest for our party, one of whom was a fish connoisseur of California. As a game fish they are not much esteemed. The salmon, that literally filled the river, would often take the hook in spite of every precaution to prevent it, and it was hard work, if not good fun, to keep the monsters out of the rapids, for once in them no tackle provided by any of the party could get them back and land them safely. But rightly managed the salmon soon gives up the fight. He is stubborn, but, after his first run, so much like the pickerel, does not exert his full strength. The fight seems to be no work, but to death. They are game to the very last, and must be secured largely by strategy. The ordinary McCloud River trout weigh from twelve ounces to three pounds, and a catch of forty or fifty requires a horse to bear the load. Fishing with a pack-horse was a novel experience.

The telegraph was sixty miles away, and as for post office, we had none; but ice was good, and we packed the large surplus of fish that a camp of twenty-six could not consume to tempt the icky appetites of our city friends, distant nearly a hundred miles by stage and about two hundred more by rail.

Why salmon bite either at a bait of their own eggs, or rise to the fly in fresh water, is to me a mystery. Some of the proprietors of our many salmon-curing establishments have made careful examination to discover the cause of their food, and nothing. One firm examined nearly 100,000 with the same result. Hence, many conclude, and our intelligent Fish Commissioners are all of the opinion, that they eat nothing after leaving salt water, and their nature might have served for Walrus, who wrote:

"Let dogs delight to bark and bite,"

for they bite from habit.

But they swallowed their bait as though this was their habit, too. Some of them were very greedy, but not greedy to the point where they would carry off a snail, or a lizard, and in a few minutes, perhaps, be landed with the lost hook securely fastened. Others would lie lazily on the gravelly or sandy edges of the pool, and scarcely allow themselves to be frightened away.

Castle Lake is also near Sisson's, but in an opposite direction from our present camp, and is a more lovely fishing ground for trout surpassed in any country. But the fishing might grow tame at last if there was no other recreation or employment. Usually, in a well-ordered camp, there is no opportunity for time to hang heavily on any one, but here, certainly, there were excursions too numerous for any one or all of the party, and too many even to mention in a single letter. But the deer hunting attracted the attention of every one to the camp. The camp was never out of view, although many bucks can be killed in this State. This is the finest deer-hunting region in California. The country is mountainous,

but not rough. A competent guide can travel 100 miles around the base of this snow-capped and glacier-clad mountain, without crossing a stream or entangling himself in chaparral, and weary neither horse nor rider. In a little mountain grove and meadow, where the south fork of the Sacramento heads, and the pitcher plant feeds on insects that seek its sweets, twenty-four bucks were seen by one man in one day. In a single trip from Sisson's to the camp twenty-seven deer were counted. But there are those who will never get the buck fever by seeking out their game, for, being destitute of the instinct of the hunter, they are sure to frighten the game for miles around. There are those, too, who have tried tricks of every improved pattern, and scored well on the target, but have never killed a deer. It is impossible to slaughter them in this region almost at will, and whoever can shoot at all can get the finest bucks without fail. There are at least twenty deer licks in the range of the party. There are mineral springs to which the deer resort; these often appear like a few drops of stagnant water here and there in the crevices of great rocks, where the deer lick the scanty fluid. Careful examination shows iron, sulphur and soda in nearly every one. One of these I went about nine o'clock one morning. As I descended the canyon wall to the bed of the deepest wild torrent, about sixty yards across, I could see several stately bucks coming down the well-trodden rocky side opposite. To move not even a muscle, when any one appeared in sight, and to advance toward them when all chance to stop and look, or to touch their branching antlers at the same time, and when each was behind some bushy tree, was no easy task, but at last we had approached within good range and I had selected the two largest bucks, standing one hundred feet apart, and almost simultaneously they dropped, one with a broken neck and the other with a pierced heart. But my own spirit sank within me at the cruel slaughter. It was doubtful if both could be consumed in camp, and then they were killed in such a cowardly way, taken by surprise, where I knew they would be sure to come. To be sure it was not even a faint allusion to the Adirondack method of driving them into the water, where one hunter seizes the deer by the tail and another blows out his brains with a shotgun, but stalking ought to be good enough for any one in this region when it is so easy on horseback. Three varieties of deer are found here—the mule, the black-tailed and the white-tailed. Of the mule deer I have seen none alive, but at Sisson's I and the lead of one that was killed last winter and weighed 166 pounds, and they frequently weigh when dressed 225 pounds.

The black-tailed deer are the most common. Somewhere I have seen it stated that the flesh of these is very poor eating and not to be compared with that of any other member of its family inhabiting North America. This is a great error, and must have originated with some one who killed a lean old doe and expected the flesh to be tender and juicy like that of a veal. When the black-tailed are in good condition the flesh is fully equal to any of the Virginia deer that I have ever seen. The black-tailed deer are migratory. Mr. J. H. Sisson, who has resided here for 23 years, and has killed perhaps more game than any other resident, is an intelligent and close observer of the habits of all animals. He tells me, and his statements are fully corroborated by everybody, white and Indian, that the black-tailed deer feed in the forest in summer from the snow line above the timber on Mt. Shasta to the beds of the rivers; that in August the bucks are found alone on the high rocky points "hardening their horns," and that as the winter becomes severe they travel across the Trinity mountains to the western side of the Coast range and along the Pacific Ocean, or else follow the general contour of the mountains toward the Sacramento Valley, and return again in the early spring.

A very few remain in this region all the winter. At some seasons they lie under the thick brush and will not stir unless closely approached, but early in the summer they lie often at the feet of large trees in open places. They go from gray to red in May and June, and the fattest are the first to change color; and go from red to blue in September; and back to gray in November and December. They feed largely on the blue thorn, a species of ceanothus. They rut principally in December, but partly in October and November.

Compared with the mule deer the feet of the black-tailed are small and the body round, the muscles lighter, the horns smaller in proportion to the body, and less regular in shape. The color is darker, and when blue it is really blue, and even when the deer is in the red it is a darker red. The feet of the black deer are long and fleshy, white under and black on top. A good buck will weigh when dressed 140 pounds. On the black-tailed deer there is usually much less white than on the mule deer. It is seldom white under the throat, but there is usually a little white around the nose. Their habitat is principally in the Coast Mountains of California and Oregon, and east to the Sierras.

Considerable abundance, and how easy it is to shoot (or slaughter) them in the many licks of this country, and how easily guides and all necessary outfit can be had at the foot of Mt. Shasta, is it not strange that one who hold and another shoot his deer in the Adirondacks? Let your sportsman who visit California bring rod and gun and turnaside for a month, or even a week, to this region, and no one need return from hunting without his first deer. F. E. S.

TIM DOYLE'S FIRST SHOT.

TIMOTHY DOYLE, the hero of this story, an Irishman, young Irishman, not long married, came from the Green Isle to the backwoods of Canada, and was told that a good single barrel shot-gun would be of mighty good service to him in his new home. So he hunted the town stores till he found in a junk shop an old "Brown Bess," which had been converted from a flint to percussion, cap lock. This gun he purchased, together with a cow-born powder flask and shot, for \$2, and returned to his home delighted with the acquisition, which he showed off in sportsman's style to the admiring eyes of Biddy, his wife. Armed with this deadly weapon, he one day sallied forth to hunt for game. His dog was not long in chasing a squirrel up an old tree, and Tim thought he would have a shot just to get his hand in before he came to more desirable sport. He loaded his gun, as he had once seen a neighbor do, by pouring the powder down the muzzle, and then he emptied this in the gun. On top of the powder he rammed down a piece of hornet's nest for a wad, then did the same with about as much shot. During this time the dog's frantic barking around the tree kept the squirrel quietly seated in a notch, waiting to be slaughtered.

"I could now, Biddy, see that chap come down out of that tree," cried Tim, aiming the gun to his shoulder. Trembling from head to foot he closed both eyes and pulled the trigger, but no report followed. Down came the gun to a

rest to the ground, and Tim peeped in through to see what could be the matter. It struck him he had not put in enough ammunition. He emptied in another charge of powder and shot, which were again wadded down as before.

"Now, Biddy," cried he, "look out; she is sure to go off this time." But notwithstanding he snapped the trigger two or three times it would not go. "Be abhorred," cried Tim, "I'll be equal with ye yet, and I'll fill yer old barrel with powder till ye do off, bad cess to ye." Around came the powder horn once more, and a good load of powder was put in on top of the two charges of powder and shot already in the gun, and, with a determined air, he was just raising it to his shoulder when Biddy cried out: "Whist there, Tim, put ye yer gun one of those little copper things in the little copper bag."

"Och, rare and oceans, that's just it; she'll go now, and no thanks to her. Fetch it along quick; the bird up in the tree there is getting tired waiting till I shoot him, so he is." Carefully adjusting the cap, once more the gun was brought up and the trigger pulled. This time it went off with a vengeance. Tim was sent heels over head, and the gun went spinning some yards off. "Biddy helped Tim up. 'Oh, are ye kilt?'" cried she. "Divil a bit," said Tim, "but where is me gun?" "I'll go for it," cried Biddy, starting to run to pick it up. "Holy Mother!" yelled Tim, holding his nose, which was bleeding profusely: "Stop, Biddy; stop, I say; don't go near the divil; there's two loads in her to come out yet; don't touch her for yer life." And there the gun lay till an older settler, who chanced to pass, explained matters, and taught Tim Doyle to become what he now is—a good shot.

STADOCENA.

ERRORS IN PICTURES OF FIELD SPORTS.

EDITOR FOREST AND STREAM:

In your issue of August 15 I have read with much interest the criticisms of "J. L. K." on "Marine Painting." He is evidently a seaman, and knows whereof he speaks. And who can fail to admire his enthusiasm over the beautiful yacht. He speaks of her as if he loved her, and I have no doubt he does. His strictures on the average marine picture are no doubt perfectly legitimate. And yet there may be some excuse for inaccuracies here. Accurate technical knowledge of the subject is not very easily obtained from books, and scamen are able and willing to give information are not found at every turn.

There is another department of art, however, equally faulty, or more so, but not a shadow of excuse. This comprises the legion of sporting sketches which adorn or disfigure the walls of our public and private houses. Most of them are so faulty as to be exceedingly offensive to the sportsman and the naturalist, or to any one, in short, who knows much about the subjects treated. To illustrate, I have before me three pictures. In many respects they are very good indeed. The landscape, the still life, the color, the atmosphere, the grouping and drawing of the figures, all show much artistic merit.

The first is entitled a "Quail Shooting." It is a very popular picture, has been much admired, and reproduced in many forms. I need hardly describe it; everybody has seen it. In the foreground are the pointers, the coveys of quails and the hunter. In the background is a field of rye, partly cut and in the distance the harvest men busy at work under the same job. It probably never occurred to the artist that quail are never shot in harvest-time, from the fact that they are mostly in the shell, and it is contrary to law in every State of the Union. The artist has just placed a late autumn scene on a midsummer landscape. That is all.

The next is "A Herd of Deer," a buck, a doe and two spotted fawns. Did the artist not know that such a group is never seen in nature? The buck is never found in company with the doe when her fawns are "in the spot." He cares no more for her or her fawns at this season of the year than he does for the sod under his hoofs. The buck has no affection for his children. Indeed he will destroy them if he can get at them. The male and female consort together for about one month—generally through November, long after the spots have disappeared from the fawns. In the picture there is a glaring anachronism. The spotted fawns indicate autumn or early summer. The fully-developed and beautifully-pointed horns of the buck certainly mean October or November.

These blunders are seen at almost every turn, and are altogether inexcusable, because the least bit of research would have pointed out the errors.

There is a print which illustrates pickerel shooting in the open water of the West. Of the artist and the writer both place a large dorsal fin upon the pickerel, an appendage which he does not possess, as every one knows who has ever seen him.

There seems to be just now a demand for literary and artistic work of this kind. Why do these men offend the public taste by producing such stuff? A picture should tell a story. The artist should be a teacher of correct principles in the natural history of the objects he portrays. In other words, he should speak the truth. In looking over these art blunders one is reminded of that celebrated picture of "Abraham Offering up Isaac," in which the old Patriarch is represented as about to dispatch his son with a modern fowling-piece, or of that other great historical panorama of the Israelites crossing the Red Sea, pursued by the hosts of Pharaoh, who are armed with breech-loading repeating rifles. VSNATOR.

Monmouth, Warren Co., Ill., August 19.

"Venator's" points are well taken. A great many anachronisms do exist, and many of them of the most glaring character. Our attention was called some time ago to a clever bit of art criticism in the London *Athenaeum*, which showed the blunders made by artists who introduced flowers which were not only out of season, but which could not belong to the locality in which they were depicted as blooming. We have before written, however, on this particular point, that the picture of a fish, for instance, which might suit the thorough art critic, would not do for the professor of ichthyology. For the former, general effects that slight necessary idealization of nature would be acceptable, while the Smithsonian *savant* would find fault if there was a scale too little or a spine in the dorsal too many. General coarse blunders, however, when nature is travestied, ought to be derided. Neither birds, fish nor animals can be drawn from one's inner consciousness. Mistakes in natural history by distinguished authors might be made quite noticeable, if one were to seek for the tares in the wheat. Does not Thackeray in "The Virginians" make the Potomac teem with salmon?

Merriman and Leland and Wells and Jones divided fifty money on thirty-four birds.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

W. C. O., Garrison, N. Y.—In Illinois.

A. C. W., New York.—Good snipe shooting can probably be had near Patchogue, L. I.

G. C. P., Broadway, N. Y.—No Pigou, Wilks & Lawrence powder for sale in the country.

D., Houston.—The makers are very responsible, and we take great pleasure in informing them.

W. B. L., Ontario.—We did find the name of the person in the Directory, but cannot tell his standing.

P. S.—Can give you no satisfactory pedigree of Shot. Inquired of H. S. Says he can't help you.

G., Philadelphia.—All hard ware stores sell trunk trimmings, which is what you want for your gun case.

H., P. M., Columbia, Tenn.—We know of no wild pigeon dealer nearer to you than T. Stagg, of Chicago.

D. J. A., Wall St., New York.—We believe the Fenobcock county to be a good one and that you will find game there.

F. P., Newark.—You will find good steel glasses at the stores of the gun-fans and dealers in sportsman's goods who advertise in our columns.

J. H., Boston.—The porous stone filter can be obtained of Tolberton, No. 111 Fulton St. Price \$1. At a small additional cost the long India rubber tube could be supplied.

D. C., Georgetown, D. C.—Yon's is a difficult question to answer. Think we would advise you to get the new American gun. The firm you ask about has been so called for about three years.

Dittmar.—We think the mixture does make good results. But one grade of Dittmar is used for fowling-pieces. Two drachms would do no harm. Does not weaken the barrel in the least.

J. C. B., Pittsburgh.—What book contains the best information respecting the breeding, rearing and training of the red Irish setter? Ans. 1. Read Irishmen, Bloodhounds, and many others. 2. Have no opinion to give—can't do it, you know.

H. G. W., Norristown, Pa.—In the country about Halsion, Pa., you will find weasels, deer, badgers, grouse, woodcock, trout, catfish, etc. We have no reliable advice as to particular stream best for camping this season. You can hardly go amies.

J. O. M.—My setter had distemper when 7 months old. He will not fatten. Lumps form on him and especially on his face. Ans. Should give age of dog and some particulars about attack of distemper. Attend as much as possible to his general health.

A. D. N., Monson, Mass.—For deer in Michigan go to the Manistee River, the region around Escanaba, Lake Lake, the woods about Kalkaska and other towns that part of the State. Take your dog along. You will find both deer and turkeys about Flint.

C. S. S., Ulca.—Dittmar's powder seems to give general satisfaction. Use exactly the same quantity by measure as you would of black powder. Mr. Spauld's powder with Dittmar, 3½ ozs. of shell, is all wrong. 1½ oz. of chilled, or ordinary shot, is a good load. Could not tell you where the rabbit dog can be had.

F. W. H., Green Bay.—My puppy, 9 months old, setter, has a broad red streak of flesh that looks very unpleasant. Ayre and nose run. Has small sores. Please to come and go. What shall I do? Ans. Give a little sulphur occasionally, and rub in kerosene oil where sores are. Consult your local surgeon about the eyes.

C. E. S., Ironton.—So much would depend on the weight of your barrels in your German gun that we could not advise. Certainly if trusted the gun never will do any good work. Such small calibers as 20 do not allow much chance to rebore. Advise you to get a new gun. To rework the old one might cost more than it was worth.

W. H. J., St. Augustine, Florida.—Give your dog a teaspoonful of sulphur three times a week, followed by castor oil on the alternate days, or give three compound cathartic pills in place of the oil. 3. Pain caused the yelping, and he probably has obstinate constipation. 3. Give the area nut in a little milk and water, or plain water.

C. H. S., Philadelphia.—Have a setter pup 8 months old. Puppy plays with loads, picking them up. When I got him his mouth was disfigured with warts. Lower lip one continuous series of warts. Has them on the roof of his mouth. What must be done? Ans. Gradually destroy them by application of nitrate of silver or caustic potash.

F. T. B., New York.—My setter pup has lice on him. What will remove them? 2. Is a gun shot injured in any way by being bent? Ans. 1. Use kerosene oil well rubbed in, and wash off half an hour after with soap and tepid water. 2. Might be inconvenient to shoot with until you were used to it. Could be straightened at a small expense.

A. McK., Baltimore.—My 8 months old terrier has little white lumps over him filled with matter. These break when squeezed. Eyes watery and weak. Terrier dull. Bays well. Lumps have come out during the last few weeks. I feed him on scraps. Ans. Cease feeding meat and give a teaspoonful of sulphur three times a week, followed by a small dose of castor oil each alternate day.

Reader, Worcester, Mass.—I have an English setter dog six months old. About a days ago a large swelling appeared over his right eye, completely closing the eye. Bad quite hard. After two days the swelling went down, leaving a soft bunch about the size of a walnut. Eyes are running some. Ans. This swelling may require puncture. You had better consult some surgeon.

Nat., Halifax.—A cocker spaniel, 15 months old, when retrieving, is hard mouthed and spoils birds. How can I cure him? 2. Bitch has had two litters from a good dog, and now lined by a cur. Will it affect her in future? Ans. 1. Can be broken by judicious treatment. A thistle in a glove sometimes does the business. Make him carry an egg, and punish him if he smashes it. See books on dog breaking. 2. Very likely to crop out in subsequent litters.

B. R. B., Sparta.—In loading your metallic shells put two wads two sizes larger than the shells in on powder and one over shot. Use plink edge over powder and brown over shot. We think that invariably two wads over powder give better pattern than one. In loading paper shells use one card wad and two Eley's pink shells, or one card and one Eley's thick felt on powder and one Baldwin wad on shot. Wads should be, for paper shells, size of the gun. Some use a tride larger.

T. M. W., Grand Tower, Ill.—My setter, four years old, passes blood from his bladder without apparent cause. Otherwise seems in perfect health. These discharges do not seem to affect his habits. What ought to be done? Ans. Cut out the bladder, and examine the bladder. World, in the first place, keep him quiet, and give him half a teaspoonful of sweet spirits of nitre once a day for three days. It might become chronic unless attended to. A little laxative medicine might do him good.

A. P. R., Rochester, N. Y.—The most prominent canoe builders are Ruston, of Canton, St. Lawrence Co., N. Y., who makes a specialty of the Rob Roy canoe. Cost about \$70. Wm. Everson, of 481 First St., Brooklyn, E. D., Long Island, makes a specialty of the Shadow canoes. Cost complete, with sails and paddle, about \$120. B. Waters & Sons, of Troy, N. Y., make all kinds of paper canoes. Wm. English, of Peterborough, Ont., builds bass wood canoes of the Indian type, and Mr. J. F. West, of East Orange, N. J., can give you information concerning canvas canoes.

W. O. E. B.—1. Is it considered safe to shoot Eley's or Kay's wire cartridges from a modified choke-bore gun, said gun being one of the 310 guns? 2. Is the blue belton a separate and distinct type of the setter, and how does the breed, as a rule, compare with the Gordon, Laverack, Irish, etc., for nose, staunchness, and endurance? Ans. 1. Ought not to be used. Safe, but might injure the gun. 2. The blue belton is a special strain, as much as Gordon or Laverack, and occupies an important relation to most of the modern strains, and was no doubt equal to any.

J. V. D., Bay Ridge.—Have a Newfoundland dog about eighteen months to two years old. Under his lower jaw, near the throat, is a soft, pulpy lump about a hen's egg in size, that occasionally almost disappears. The lump referred to is not strictly stationary, and has lasted for a long period. At the same time, he is troubled with canker of the eye. His appetite and general health are good. The canker, otherwise it is poor, and he eats little for meat. Inform me of the nature of the above, with the mode of treatment? Ans. Try and cure him of the canker. Feed no meat for a month. Give a little sulphur twice a week, and pour a little lead water in the ear each day, holding it there for a few minutes.

T. A. K., Okauka, Ill.—What do you consider the best cure for distemper? Ans. There is nothing more general than the term employed to describe the first sickness in dogs. This we have repeated in our columns innumerable times. Distemper may be quite a different disease in one animal from another, just as in children croup differs from measles or scarlet fever. We cannot, then, advise one certain specific as a cure for what is called distemper. The best thing to do is when the emergency arises, to keep the animal warm, and give him a nose, to give a good laxative, and avoid events. The salt cure mentioned by us, contributed by a correspondent, we have of late had good report of in quite a number of

B. A. M., Marlinton, N. Y.—For woodcock shooting use one of No. 12 shot. Woodcock retire to the higher and more mountainous districts to moult. They eat worms, the larvae of insects, etc.

W. J. P., Rockland, Me.—My setter pup, 6 mos. old, had the distemper. I tried the salt cure on him. It made him so weak that he could barely walk. Now he is very poor and miserable. There is a thick discharge from his eyes. What must be done with him? Ans. In a former number we expressed that the use of salt or salts for a long period was a heroic method of treatment, and might not be adapted to all cases. Be careful of the dog's diet. Do not let him eat for a while anything but good oat meal with broth. Give him a teaspoonful of oil of sweet almonds, and try and build him up. He may have over-depleted by the treatment. Follow this up with a good laxative every other day for a week. There is a weak strain in him, but he did not get well, if judiciously treated. We would be glad to hear from you again.

SETTER, Sag Harbor.—Please tell me in your next what you would call a dog answering to the following description? Black and white; head dark, pointed with white; 12 inches from end of nose to foot head; forehead 4½ in. broad, 6 in. around nose, 13 in. around head; jaws forward of ears; upper lips broad, inside of mouth very black. Ears 5 in. long, set well back; very large lump on top of head; 8 ft. 1 in. long exclusive of tail; strands 22 in. high forward, 18 in. high on hips. Hair, long and very fine on ears, hind legs and tail; weighs 41 pounds; 8 months old. Marked—black head, saddle and hips white, neck, chest, sides, legs and tail. Has fleas, what shall I do for him? Answer: Wash and white setter is the best way we can get it. He may be so much so that you strain as far as the color goes. For fleas wash him and apply kerosene, washing him afterwards.

R. S. G., Ashland, Wis.—1. To waterproof cloth: Take half pound sugar of lead and half pound powdered alum, dissolve in bucket of water, pour off into another vessel, steeping the canvas into it. Soak well, hang up to dry, but do not wring it. Paste this in your hat. 2. Rinse articles of clothing, etc., in water, with one ounce alum dissolved in it. This will render them practically fireproof. To remove mildew: Slacked lime, two bushels. Draw off the lime water and mix 120 gallons of water and ½ pound black vitriol. 4. Pyrethrum rubrum is the insect powder. 5. To patch rubber boots: One half pound bi-sulphate carbon, three handfuls guano-percha. Put in wide-mouthed bottle, shake frequently; at end of two weeks we can get it, 25 cents a bottle. Remove the cork tight, and pour the article into the cement and allow it to evaporate before bringing edges together. After it has become light colored in spots warm and bring edges perfectly together, stand away for awhile and the job is complete.

Loon Fort, Toronto.—If your boat is 24 ft. in, over all we assume he is about 24 ft. on water line. In that case would advise lengthening her amidships so that she will have 3½ beams to her length. Your beam being 7 ft. make her 24 ft. on water line. She will then stand up to her present canvas better, as she will take more ballast to bring her down. Put this as low as possible. She will be roomier, faster of the wind and probably do quite as well in the wind. A simpler way to make her stand up better will be to transfer as much of her ballast as possible to the under side of her keel by putting on a "shoe" of lead, say 12 ft. long, 4 in. deep and 4 in. thick, or its equivalent of 400 lbs. in some places. Remove this ballast from inside. If possible, substitute wooden floor for the metal one and stow the metal between the timbers under the floor. This will materially lower the boat's centre of gravity. Perhaps you carry too much canvas in your lower sails, of that we cannot judge without more particulars. You might easily experiment by putting more ballast in her as she is at present, though bringing her down deeper in the water would alter her trim and might injure her sailing, but the reverse might also be the result. As it is easy to remove the extra ballast again you might alter her trim, first, by moving the extra ballast to the present ballast under keel, etc., as explained above. The lengthening operation would be the most expensive. Remember that narrow boats always keep more than broad, shallow craft at the outset, but become stiffer than the other type the stronger the wind blows.

T. C., Roslyn, L. I.—The "Whitehead" fish torpedo is an English adaptation of American experiments made many years ago. Mr. Whitehead, chief engineer at a torpedo factory in Trieste, Austria, brought out the invention in an improved form, since which time the British Government has been experimenting with it at the Woolwich arsenal. It is steered by an automatic arrangement which keeps the torpedo in a straight line, and when once started in its course, with the operator ceases and no change in direction can be effected. It is retained at the desired depth by means of automatic valve attachments to air chambers connecting with a reservoir of compressed air. By admitting the compressed air into them to a greater or less degree water is driven out, or let in, and the torpedo rises, or sinks. The valves operate through the differing densities of water at different depths. The torpedo cannot be steered very accurately, and its efficiency is much overrated for practical work. The propelling power is compressed air. The steel cases are made by boring out of the solid so as to avoid joints which would leak under the 600 lbs. pressure to the square inch. For rough water the torpedo may be set down as absolutely useless, excepting at very close quarters; anything which cannot be guided over its course by an operator is very uncertain in its efficiency. The Lay and Ericsson torpedoes are much more dangerous weapons of attack than the fish. Explosions on a vessel's side above water would be very ineffective and it would require a much heavier charge to produce damage than under water, as most of the force of the explosion would pass off through the air away from the ship. Cannot say exactly how many pounds of nitro-glycerine would be required to shatter the sides of an ironclad. Only experiment can determine that.

KANES, St. David's.—Smallest skiff for two persons should be about 9 ft. 6 in. long, but 16 ft. would do better. Cut out a section board 3 ft. 6 in. on top, 3 ft. 6 in. on bottom and 11 in. deep. Take two boards each of 3 in. on top, 3 ft. 6 in. on bottom and 11 in. deep. At an angle to suit taste for rake of stem and counter. Cut out stern piece from 3 in. thick board say 2 ft. 6 in. across top, 3 ft. 2 in. across bottom and 9 in. deep. Make stem of oak, about 3 in. stuff. Cut rabbit in it. Now stand up the mid ship section. Nail the two side boards lightly to the section and bend the ends together at the stem. Insert and at the latter, then the stern sides to it in the rabbet. Bring them together at aft and nail to the bottom of counter. Trim everything, turn over and nail on bottom boards of 3 in. stuff crosswise. Tongue and groove boards are best. Turn up again and put in a board in the boat's center, running the entire length and about 6 in. wide. Nail to bottom. Put on a keel strip outside about 3 in. or 3 in. thick to save the boat when beaching. Next put in thwart; wide one in stern, one in middle and one up in the bows. Nail the thwart in the stern, or stern, or stern, or stern. Take out the section board. Put a skag piece in the stern, and nail to the bottom at from the point where it begins to turn up, and a stern post up and down, across the stern board and the skag. This will stiffen the latter. For thole pins cut rectangular pieces in sides and nail a strip alongside of them on inside and outside. In the recesses thus formed ship the thole pins. The recesses should be 1½ in. long, 2 in. deep and 3 in. apart. If you wish put on a narrow chadog batten along upper edges outside. Oars about 6 ft. 4 in. long. For sail use leg of cloth, about 3 ft. 6 in. high, 11 ft. 6 in. long from bow through hole in forward thwart. Yards 6 ft. 6 in. long. Sail about 50 square feet light drilling.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDICATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2333.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible. All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, SEPTEMBER 5, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES BALLOCK, Editor.

T. C. BANKS,
Business Manager.

S. H. TURRILL, Chicago,
Western Manager.

FOR THE FEVER STRICKEN CITIES OF THE SOUTH.

LAST week the following circular was issued by us and sent to all our advertising patrons, to the sportsmen's associations and rifle clubs in the New England and Middle States:

"New York, August 29, 1878.

"The attention of the nation is turned to the fever-stricken cities of the South. The sufferings of the sick are greatly augmented by a general destitution consequent upon business stagnation. The appeals for aid are urgent.

"I am convinced that these appeals will meet a ready and generous response from the sympathy and benevolence characteristic of the fraternity of sportsmen, and to facilitate the proffered assistance of sportsmen and sportsmen's clubs, we will cheerfully receive all contributions, which will be acknowledged in our editorial columns, and at once given into the general fund in charge of Mayor Ely of this city. The money sent through the agency of the FOREST AND STREAM AND ROD AND GUN is to be known as the 'Sportsmen's Contribution.'

"Money orders and drafts should be made payable to 'The Forest and Stream Publishing Co., New York.'

In response to the same we are in receipt of the following amounts for the "Sportsmen's Contribution."

Forest & Stream Pub. Co.,	\$35	Dr. S. T. G. Dudley,	\$10

Messrs. Stanton & Co.,	10	Mrs. F.,	1
John Scott,	10		

The total amount, \$173, we have this day handed to Mayor Ely for distribution in the South. Our work has but just commenced. We know of a good deal of money on the way to us, and all contribute who can. We feel sure that our appeal will not be in vain.

As the money comes in we will turn it over to the Mayor, and full lists of donors will be published in this paper.

OUR INTERNATIONAL TEAM MEN.

The season of 1878 cannot be called altogether a blank one, with such a record as we herewith present of the endeavors of the team candidates for places on the squad of 1878. They were made at periods extending over a month on ranges here and there over the country, in all sorts of weather, generally not the most favorable, and by men in many cases working singly; or where direct competition did exist, there was, of course, no helplessness in it, nor were the men stirred to great endeavors by the prospect of a coming team of foreign champions. There was everything to discourage, and little to encourage the formation of the very best. *Per contra*, the men working for places were in nowise tyros. They were all men of intelligence, and as riflemen trained to that careful watchfulness over minor details, which yields the difference between a medium and a magnificent score. How slight a thing may bring down a score is seen in the case of Professor Dwight, who made his big scores of 218 and 219 on the 12th and 13th of August respectively. Owing to some error in the arrangement of dates he was compelled to shoot again on the 15th and 16th, and scores of 197 and 188 were made, the fatigue and the care of such a slight built man being sufficient to create the falling away. The team will now be called together, elect a captain, enjoy a few days' practice together, and then shoot over the ranges for the "Palma" in 1878. Really, for all purposes as a record, and for the scientific memoranda, it will be all that could be secured were a dozen teams in the field. With such a magnificent initiative the team of 1878 should put something on the rifle record overtopping anything now on the cards, even though it should result in creating a permanent panic and stay-away feeling among the foreign riflemen:

SCORES BETWEEN JULY 16 AND AUGUST 10 INCLUSIVE.

HOW TO NAME A YACHT.

OUR contemporary *Pacific Life* has an appropriate word to say upon the abominable practice in vogue of naming vessels after some fifth-rate little politician, or a corner loner unknown to the world beyond the block he lives in. All the more nauseous is it to see such designation applied to yachts. The Christian names of feminine gender may be excused, though even they become hackneyed, when the *Lizelles* and *Carries* and *Belles* and *Annas* number up in the hundreds. But to call a pretty clipper after such a meaningless inanity as John T. Smith, H. F. Brown, O. R. Jones, J. U. G. Johnson, *Edt genus omne*, is carrying the mutual admiration business a little too far. Who on earth, outside of the intensely dull and narrow limits of a country town, knows or cares for the Smiths and Browns and Joneses anyway? Such names are apt to repeat any one before he sees the yacht. In contradistinction are such pertinent and appropriate titles, which have lately been followed up on a certain line among some jib-and-main-sails in our waters; they include *Thistle*, *Nettle*, *Bramble*, *Thorn*, *Prickle*, *Briar*, *etc.*

What does our contemporary think of the following plan for naming a yacht? Invite all the girls in the neighborhood, seat them in a circle, tell them to think each of a name, and at the count, "one, two, three," sing them out as loud as they know how. The first name caught by the owner's ear decides the clipper's appellation. There need be no fear of the young ladies all calling out their own names, not at all. This happened once, when all those rejected are said to have immediately drowned themselves. The terrible consequences have ever been a lesson to the fair ones. And then girls have so much more taste in such matters than your rough-and-ready tar.

THE SCOTCH HERRING FISHERY.

WE published some time ago a very remarkable chronological table due to Mr. Lindahl, of Sweden, which gave the periodical visits of the herring to the coasts of Northern Europe. Herring may be always caught in the northern waters in larger or smaller quantities, but Mr. Lindahl shows in what years herring abounded. From a careful examination of the tables there appears certain intervals when the fish are found in great numbers. During about eighty years between the lapses of a century, fish seem to swarm, then the shoals disappear and fish are scarce. No exact rule can, however, be formed as to when the fish may be expected in large numbers. Mr. Lindahl's first date of abundance is in the year 1020. This was followed by a herring period during the latter part of the twelfth century. Then again at the close and middle of the thirteenth century. From 1556 to 1590 the fish were in enormous quantity, the large catches lasting for thirty-five years. There has been preserved fairly authentic data of the enormous catch in the sixteenth century. It had a special name and was called a *Land-Stotting*. Old chroniclers state that for a space of fifty and sixty miles the

shores of the Swedish mainland and the adjacent islands were covered with curing and salting houses, many of them two and three stories high, and inhabited by vast multitudes of people who had congregated there from various and distant parts, and whose sole occupation was in connection with the fisheries. Herring were so abundant that thousands of ships came annually from Denmark, Germany, Friesland, Holland, England and France to purchase fish. One small town, Marstrand, alone, for a long series of years, shipped 600,000 *turnor*, or some 2,400,000 bushels of fish. In 1587 the herring disappeared and reduced the fishermen to misery. There is a strange old story which is told on the Finland coast how the queen of the herring having been caught all the rest of the fish left. The advent of herring in 1774 was a very large one, and it seems to have lasted until 1804. In 1809 herring were very scarce on the coast of Sweden, and perhaps have never been in as large quantity as in former years.

Our attention has been called to the report of the Scotch Fishery Board for 1877. We find that the total number of barrels cured was 847,718, being almost 250,000 barrels more than last year. Taking the average then of the last ten years the total annual catch must be something like 843,250,800 herring, worth some \$1,756,723. In the year 1876 the herring harvest was a failure, only 593,197 barrels having been cured, while during 1873, '74 and '75 the catch represented respectively 939,233, 1,000,561 and 942,980 barrels. Many causes were alleged for the absence of herring, principally the bad weather which occurred in 1876. Taking, however, the highest yield of fish in 1874 as something over a million of barrels in proportion to the increase of boats, fishermen and implements now in use, it seems that for the present fish must be less numerous than in former years.

Some curious investigations have been made in regard to the number of herring destroyed by the birds on the Scotch sea coasts. "It is assumed," says a leading authority, "that the gannets consume more than 1,110,000,000 herrings per annum." But this can by no means account for the loss in herring, as the gannets in former years devoured quite as much fish as they do to-day. The devastation that cod, haddock and hugg and other fish make on the herring is undoubtedly greater than the birds; and it is supposed that on the Scotch coast the incalculable number of 29,400,000,000 of herring are consumed by these fish. When the fishing in Scotland is compared with the industry of former years, the enormous expansion of the fishing interest is manifest. There are 7,000 boats fishing for herrings in the Scotch seas, with an aggregate of 230,000,000 of square yards of netting. If these nets were placed in a continuous line they would stretch out to 12,000 miles—more than across the Pacific—and would cover a superficial area of seventy square miles. If, then, the power to capture has increased fivefold, the catch has not responded in an equal ratio.

In comparing the results of the Scotch herring fisheries with our own, it will be found how really insignificant is our catch. Professor Brown Goodie read before the American Fishcultural Association, in February last, a table of the estimated value of the United States Fisheries for 1876. In this table we find the value put on herring to be \$507,977, and the weight 23,000,000 of pounds. It is the menhaden fishery which at present is of great importance, its value being in 1876, some \$1,657,790, representing a catch of 463,000,000 of pounds. It is quite probable that this year the catch will represent something over two millions of dollars. This special fishery employs 1,500 men, with sixty-five steamers, and several millions of dollars are embarked in the enterprise.

THE BUCEPHALUS OF THE PLAINS.

YOUR general reporter must be an imaginative person, and your St. Louis one most particularly so, for it is to this gifted individual that we are indebted for the story of the "Wild Texas Racer," who makes three miles in 4:50. These are the figures, with a stop-watch. The FOREST AND STREAM AND ROD AND GUN is not a horse paper, but still the history of this untamed pacer is so wonderful that we must give it in detail. The untamed delights in the name of the "Black Boss," and is the glory of the plains. When you go for Boss he looks at you, whinnies, flirts his tail, and is off like greased lightning. Once (so the reporter says) the celebrated Mexican vaquero, Juan Gonzales, went for "Black Boss," tooth and nail, mane and hoof, with mounted relays and lassos and lariats. It was colt's play for the Untamed. Even when they had driven him into Hermosa Gully, and had the rope on his neck near the Wichita Mountains, and the vaquero and the whole of the company sat on him, he got up and, like that Western play mule in the drama of the "Forty Thieves," he kicked the whole establishment to smithereens. He bit Juan G., carried him three-quarters of a mile by the nape of his neck at a gallop of 2:13 (Hanus' time), then dropped him and betook himself to his native plains with a snort. The "boys" were not, however, disheartened, but ran him for twelve long months; but it was no use. Now, alas! "Black Boss" has learned to be cunning. He no longer awaits the chase, but at the sight of a pursuer "devours the earth," as the Arabs call it, or "dusts," as we Yankees briefly express it. Now, all this is very fine; but we are forced to put but very little credence in the whole story. Ferocious lion hunts can be as plausibly written up in New York as wild horse chases in St. Louis.

We doubt if to-day there are really any true wild horses in Texas. We mean those which are, or have been, wild during several generations. A good many horses escape from herds and roan, and are not wild horses, as the public under

stand them. Some time ago our attention was called to a paragraph which ran the newspaper cycle. This told how two men in a buggy with a pair of horses ran down wild horses. Sighting their herd of wild horses, they always kept them in view, following them up day after day until they tired the wild horses out. Now, plainness, to whom we showed that paragraph, fairly split their sides with laughter. "What must you people down East believe! There ain't no turn-pike road over a prairie. Catch horses that way? If the wild horses get tired out don't you think the man's team would get used up, too? It's just confounded nonsense."

We have been looking up this wild horse business for quite a number of years, and this is the upshot of our researches: The untamed steed of the Ukraine (at least in the United States or territories) exists no longer, save in combination troupes with peripatetic Mazeppas in flesh tights. Possibly twenty-five years ago there might have been found some few herds, where now are the territories of Nebraska and Wyoming. There is the barest chance that south of what is called the Stinking Water country on the Loupe, some few might be discovered, but even this is doubtful. We have from the best authority that four years ago three horses were run down in a snow storm, worn out and famished, which were supposed to be the last of a band, but reliable trappers and hunters doubt if these horses were wild ones. Dr. Carver tells us that he has never heard of any wild horses of late years, and other guides and explorers affirm the same thing. Following up our wild horses led us to inquire about creasing. Now, we have always believed that creasing was a mythical performance. Neither Carver nor John Omohondro believe in it. Carver said to us: "I have tried it on a horse that we couldn't catch, and it always resulted in killing the horse. I have planted my ball just where I wanted to, some inches or so below the mane, so as to clear the spinal column, and the horse keeled over it is true, but he never got up again. Only once a horse seemed to recover, but he died in the long run. You read about creasing mostly in dime novel literature, but it's all bounce. Just possibly, in old times, with a small calibre or a spent ball, a horse might have been knocked down, but with the rifles used on the plains it is death to a horse. Such loose horses as may be caught are not really worth much. Endurance they have, but not great speed. When you break them they lose spirit, save to buck when the fit is on them." To conclude, the Bucephalus of the plains does not exist in 1878.

MIDSUMMER JAUNTS OUT WEST.

BY THE EDITOR.

JAUNT THE FOURTH.

NEENAH, Wisconsin, 1878.

BRETHREN: Since I sent you "Jaunt the Third" my roving pen has been gathering facts through half a dozen States—here, there and everywhere, pretty much as the bee sips: and it is only just now that I have been able to line the busy worker home.

Hence my long hiatus.

When I "lit out" from Louisville, Ky., lately, to escape the stifling heat, I made tracks due north, 500 miles or more, as you know, until I reached the shores of beautiful Winnebago Lake, in Wisconsin. There under the shade of the Treaty Elm where Gov. Doty sealed his compact with the Indians forty years ago, I found that peace and bodily comfort which was assured at the time when the pipe of peace was smoked. The ancient tree stands on a point projecting far into the lake, so that all the coveted zephyrs which blow stir its drooping fronds. These cover an area ninety-six feet in diameter, and whenever a chance breeze sways and lifts them a little, I catch glimpses of either shore from my reclining place on the grass beneath. Under the edge of the canopy, far away to the right, are the blue cliffs of Clifton, which are scarcely distinguishable from the summer cloud on the hazy horizon. Against the blue are the white sails of a dozen yachts strung out in a line, motionless, and diminished to mere specks in the offing. They have loitered there the long day through, like maids in sulks, gazing abstractly at their reflections in the glassy surface: illustrating the vicissitudes of ardent yachtsmen in a midsummer regatta—no wind, out of ice and patience, and everything red hot and limp; time allowance discounted, and the foremost in the race nowhere. From my weather quarter the shore sweeps around, leftward, in a great arc, first receding until it scarcely defines the distant head of the lake, and thence advancing nearer and nearer, until the hardly discernible trees which fringe the margin begin to develop, and gradually take form and comeliness. Just where the line of growth breaks off, the Fox River leaves the lake and a lighthouse stands sentry. Two miles this side, and abreast of the point where the great elm stands, another affluent of the river leaves the lake, and the two uniting, enclose a pretty island, six miles in circumference, the wooded shores of which fill up the features of the landscape on my left. It is called Doty Island, and Gov. Doty's log mansion is the most conspicuous object seen across the channel. Forty years ago the Winnebago Indians used to paddle in from their fishing excursions on the lake, and drawing their bark canoes up the sloping shore, without fear or prejudice of white man, saunter up to the Doty house and salute the Governor with an emphatic "How!" This familiar monosyllable usually carries with it an intimation that a plug of tobacco for the pipes and a handful of sugar for the squaws would be acceptable—and I believe the Governor never bestowed grudgingly. Thereby was comented a friend-

ship so lasting that the Winnebagoes have never blackened their faces toward their white brethren.

Close beside the old mansion, nearly hidden by the trees, is the Island House, kept by John Roberts, which is allowed to be one of the most charming summer resorts in the State. Being on the line of the Chicago and Northwestern Railroad, it is much frequented by Chicago people, including the families of the company's officials themselves. The Wisconsin Central Railroad also has a station two miles distant; so that the house enjoys a constant and considerable patronage. From the piazza a lawn slopes to the margin of the lake, where a little wharf finds sufficient depth of water for the largest steamers which ply between the towns of Menasha, Oshkosh and Fond du Lac. Fruit trees and arbors diversify the lawn, and a fringe of large forest skirts the shore.

Winnebago Lake is thirty-eight miles long and eighteen miles in greatest width. It abounds in sturgeon, bass, sheepshead, muscalonge and pike perch, and affords unlimited sport to the angler. Excursion steamers take out fishing parties daily, and it is not unusual to see a dozen skiffs strung out in line, towing asters, en route for well-known islands, reefs and sand bars, in mid-lake, where the fish most congregate. On one of the larger islets the Oshkosh Yacht Club has a rendezvous, with commodious house and picnic grounds. Experienced and enthusiastic anglers take to the small boats and troll with spoon and minnow, or fish along the reefs with fly; but many remain on board the steamer, preferring the company of ladies and the grateful shelter of the awnings, and these often catch large numbers of bass and other fish trolling from the stern at low rate of speed. There is excellent bass fishing in July and later in the outlets of the lake, the branches of Fox River, and bass may be raised with fly along the rushes and lily pads which edge the shore within a stone's throw of the hotel.

Doty Island is the joint possession of the sister towns of Neenah and Menasha, twin rivals which cannot be induced to affiliate. The factories and business houses of Neenah are located on one branch of the Fox, and those of Menasha on the other, each town occupying both sides of its respective river. A broad avenue divides the island, and the streets of the rivals run parallel and side by side. Each has a population of about 5,000. The drives in the vicinity are very charming, and taken all in all, there are few places where the summer season can be passed in a more enjoyable manner.

Five miles down the river is the town of Appleton, the busy centre of the large manufacturing district to which the Fox River furnishes inexhaustible water power. Products to the value of \$2,500,000 are annually manufactured there, and include baskets, barrels, bricks, carriages, furniture, flour, iron, leather, lime, lumber, machinery, paper, wood pulp and woolen goods—the item of flour alone reaching nearly \$1,000,000, and of iron \$400,000. Appleton is only in its infancy. In a quarter of a century it will lead nearly all the great manufacturing centres of the Union, because its water-power is greater, inexhaustible and constant; and because it is the geographical centre of great economic interests, and lies directly upon the line of a trans-continental highway, which will soon be made practicable by a navigable ship canal from Lake Michigan to the Mississippi River. It does not depend upon mountain streams and the caprices of droughts and freshets for a precarious supply, but it has 500 square miles of water always in reservoir in the lakes Winnebago, Poygan, and Butte des Morts. This great water route follows the Wisconsin River from its debouchure at Prairie du Chien half way across the State to Portage, and thence by a short canal into the Fox River which connects a series of large lakes, and finally empties into Green Bay, on Lake Michigan. The Fox River improvement, of which so much has been heard, was initiated nearly forty years ago. It contemplated the opening of this great water route to commerce, and the utilizing of its power for manufacturing. After bankrupting several companies, it recently passed into the hands of the United States Government, and is making rapid and substantial progress toward the great consummation. Light draft craft long since passed through the entire water-way, but it is believed that four years must elapse before the commercial dream of practical navigation will be fully realized. Already there are sixteen dams across the river, of which six are massive stone constructions, 700 feet in length or more, at each of which large manufacturing interests cluster. It was my good fortune to traverse the entire distance in a steam launch in company with Col. A. Fuller, U. S. Engineer in charge of the improvement, and the enjoyment and diversity of such a voyage—now in the canal, and anon in the broad picturesque river—may well be imagined. At Appleton are no less than thirty large factories, which line the sides of the river and occupy the busy islands in the centre. The boats of the canals and the cars of the Chicago and Northwestern Railroad take up the manufactured wares and merchandise at their very doors. Those who have contemplated with amazement the industries on the Merrimack, the Genesee, the Connecticut, and the Mississippi at St. Anthony, would be more than startled to observe the visible water-power at Appleton and on the river below. The amount of power running to waste can hardly be estimated.

The town of Appleton is romantically located. The houses of the wealthy occupy the verges of the bluffs which flank the river and overlook the busy industries below. Back of the residences are the business streets, which lead to several bridges which span the river. The surface of the suburbs is undulating and pleasant for building sites. A pretentious hotel

occupies a shaded spot near the bluff, and a band stand in a little park opposite is the source of agreeable music in summer evenings. A mile below the town, across the river, is a park with a little menagerie of wild animals, a half-mile race track, and the popular Tellulah Sulphur Springs, where one can drink his friends' health with a flavor of hard-boiled eggs. Conveniences for guests, and row-boats on the river, which is here broad and deep, make the resort more enjoyable. All along down the river the bold shores are dotted with farm houses and enlivened by ripening grain. Cultivated fields alternate with forests. Broad stretches of smoothly flowing river contrast with the vivacious tumble of the foam over the great dams and the swirl of the eddying water below. At sixteen long intervals sloop arms swing open the great gates of the locks which bar the passage: a stone sarcophagus receives the launch and its living freight, which gradually settles down from the daylight into the watery sepulchre below; there is a temporary sense of dampness and a stifling fish-like smell, such as one experiences in a vault; stone walls sixteen feet high enclose us on all sides, and all that is needed to make a first-class tomb is, to hermetically seal the top. Deliverance can come only through the open door; and when at last the gigantic leaves fold back, and the escape valve of the little steam engine emits a sigh of relief as we emerge into the sunshine and pure air, we feel like the astonished Seducer at the last day, who foolishly believed there was no resurrection. However in a July day the occasional change from the heated atmosphere into the lower temperature is rather grateful than otherwise. To me the journey was as much a novelty as the passage across the Styx into Hades will be, with the advantage in my favor that no fee was demanded, Charon being so much engaged in watching Cerberus that he had no time to attend to legitimate business.

One of the quaintest places on the Fox River is Depere, where great blast furnaces belch continually and the air is black with smoke. Depere was an old French mission town hundred years ago. Green Bay, at the mouth of the river, is cheerful and enlivening. It wears a busy aspect, with its many brick warehouses by the river side; its beautiful private residences on eminences; its crowning spires; the round-houses and slopes of the Wisconsin Central Railroad on one bank, and of the Chicago and Northwestern on the other; great drawbridges spanning the river and uniting both; puffing steam tubes whistling for passage, and great lake steamers lying at the wharves. It has 8,000 population. Until recently it was a thriving and growing place, but has lost much of its importance by reason of a decline of the lumber interest in that particular district. With the full completion of the great canal across the State it will doubtless revive and become an important outpost and entrepot. As a summer resort Green Bay has always been popular, and especially visited by Southerners. Its yachting and fishing are fine and the hotel accommodation excellent at Cook's, the Beaumont and the National. The greatest loss which the town has to deplore is the historical "Green Bay Horse with Switch Tail," which has skipped.

HALLOO.

[FROM A STAFF CORRESPONDENT.]

ROCKY MOUNTAIN WANDERINGS.

NO. 2.

THE railroad and its accompanying civilization have greatly changed the character of the Western outlying towns and of their inhabitants. Many of the old time desperadoes have perished by the bullet or the rope, while others have turned from their evil courses and become respectable (*sic*) citizens; not a few, however, still haunt the small railroad towns and eke out a precarious existence by gambling, horse-stealing or robbery. Their numbers are happily growin less each year.

A little occurrence which took place at Rock Creek Station while our train was stopping for supper recalled to my mind some of the scenes of early days. A number of bullwhackers (Western vernacular for the drivers of ox teams) were in camp here, and were collected at the station to see the train come in. A few moments before its departure, while walking up and down the platform, I saw a very large man, armed with a four-foot club, beating a much smaller man who was apparently unarmed. The latter fled at once, and was pursued by the large man, who soon caught up to him and struck him again. At this blow the smaller of the two, who was called Wild Texe, turned, and, springing at his assailant, stabbed him three times, cutting him in the side near the heart, in the small of the back and in the arm. The large man, Irish Mike by name, dropped as if he had been shot, but almost immediately sprang up again and recommenced the pursuit. Wild Texe, however, kept well ahead of him and gained a position of safety near the rear of our train. Mike fell again on reaching the platform, and, when the train passed him, as we moved west, he was apparently in *articulo mortis*, and was howling lugubriously; he was covered with blood—a sickening sight. Wild Texe, after loitering about for a few moments, started off south over the prairie, but had only made about sixty yards when a number of the wounded man's friends, with fierce oaths and threats, but most of them without arms, started off after the fleeing wretch. As we passed the bullwhackers' camp, which was but a few hundred yards from the station, we saw a lithe, active man, hatless, but with his rifle in one hand and his cartridge belt in the other, running over the prairie with great swiftness, and in a short time I could see the flashes which indicated that the Texan was

being shot at. It was doubtful in my mind whether the fugitive would be overhauled or not. It was rapidly growing dark, and in such a light it is difficult for a man to see his sights so clearly as to shoot well; besides, if the fleeing man can keep ahead of his pursuers for a few moments he can hide in the ravines and escape during the night. At Medicine Bow that evening I learned that the wounded man was still alive, and that Wild Texe had been captured and was then in duance. How matters have turned out since then, whether the wounded man died and Texe was lynched, or whether matters were amicably adjusted among the bullwhacs I have no means of knowing.

An hour after leaving Rock Creek we reach Medicine Bow, the point from which we propose to start on our first trip. East and south of this town are extensive beds of Jurassic age, which have already yielded many tons of fossil bones, and which it is our purpose to explore still further. Then too, there are, on the plains and in the mountains, many species of birds still rare in the collections of eastern ornithologists, while deer, elk, antelope and bighorn are said to be abundant in and about the mountain ranges through which the Medicine Bow River flows. This country, although it has been traversed by more than one exploring party contains much that is of interest and the labors of a careful observer will not go unrewarded.

Medicine Bow is situated on a river of the same name about 650 miles west of Omaha. Some time spent in the collection of information in regard to it enables me to furnish the following statistics: Number of buildings in the town, nineteen, of which fourteen are dwelling houses; resident population, sixty. The town has been the point from which freight is hauled by wagons from the railroad to Forts Fetterman, McKinney and Reno, and the business brought to it from this source caused it for the time being to assume a certain air of business activity. Recently, however, the shipping point for freight has been changed to Rock Creek, and at present Medicine Bow stagnates.

Leaving the Bow in the afternoon in company with Mr. W. H. Reid, I am driven about twenty miles to the rancho of Mr. J. S. Jones, where we shall make short trips of two or three days each into the neighboring mountains in search of game. Mr. Reid, my companion, is an old resident of the Territory, and is thoroughly acquainted with almost every foot of ground in it. As hunter, miner or prospector he has traversed it in every direction, and is equally at home on the plains or in the mountains. A good fellow, an admirable hunter and an unusually accurate rifle shot, he is the man of all others whom I should select if ever I should be so fortunate as to make another hunt through Wyoming. He has told me that we are a little too early in the season to find the best hunting, but that there is a fair prospect of our finding elk, mule deer and mountain sheep on the western extremity of the Medicine Bow Range. In this particular section of the country the game, that is elk and deer, commence in summer to work south into the high mountains which lie between the railroad and North Park, and follow the snow line as it ascends, thus reaching by July or August the highest points of the range. At the approach of winter these animals commence to descend the mountains, moving northward, crossing the Laramie plains and the Platte Valley to the Platte Range, which includes Laramie Peak and the Sweetwater and Seminole Ranges, where they pass the winter. The latter range is much lower than those which lie to the southward, and the snows are light and, except on the higher peaks, soon melt. This northward movement of game scarcely begins before October 1st, while the movement toward the south commences in early spring as soon as the snow softens.

At Mr. Jones' rancho we were most kindly received by the proprietor, and our stay there was rendered extremely pleasant by his hospitality and that of his wife. Although his rancho is not as yet fitted up for the reception of guests, we were most comfortably entertained, and we greatly enjoyed the delicious milk, butter and vegetables with which the table was each day supplied. These may seem commonplace delicacies to those who have never roughed it in the mountains or on the plains, but those who have will remember how rare and how desirable they are. Mr. Jones proposes this winter to make considerable additions to his house, and next summer will be able to accommodate parties from the East who may wish to hunt on Elk Mountain or in any portion of the neighboring Medicine Bow Range. He has a herd of about fifty head of horses, and will be able to fit out parties with everything that they may need except arms and blankets—these they should of course bring with them. I feel warranted in saying that satisfaction will be given at this rancho, and that the charges will be moderate. At the proper season, game of all descriptions is to be found in the vicinity. Sage grouse abound on the creeks which flow into the river; antelope are numerous on the prairie, and the mountains will yield elk, deer, bear and probably mountain sheep, though the latter are becoming scarce.

Even were there no game in the country, no lover of nature could wander along the valley of the Medicine Bow without feeling repaid for his journey to this place. The trees and the air are full of rare and interesting birds, whose sweet songs fill the heart with delight. At short intervals along the river we find fresh beaver dams, and, by quietly watching for an hour or two before sunset the artificers of these curious structures can be seen busily at work stopping leaks, gathering food, or clumsily sporting in the water. Make but a move, however, and, with a loud splash, some watchful old fellow signals to his mates that there are strangers present, and

down all dive, not soon to reappear. As we push through the brush, intent on the new objects of interest which constantly present themselves, we are startled by a sudden crackling of twigs and a rush through the quaking aspen brush, and, in a moment, we see in a little opening about forty yards distant a fine buck mule-deer, which stops and gazes curiously at us with his soft, innocent eyes. His summer coat is just falling off, and the short, now hair is of a fine steel blue; his horns are still in the velvet, but are full-grown and now nearly hard. Involuntarily I raise my shot-gun, but lower it again with a smile—it is loaded with dust shot for small birds. Even if I were a rifle I do not think that I should have the heart to take the grand life that so unobtrusively offers itself. No, let him go; I shall have other opportunities when the hunting fever is on me.

After a day or two of bird-collecting, Mr. Reed and I obtained ponies and provisions from Mr. Jones and started for the western extremity of the range on a little hunt. As we wish to travel as light as possible we each tie a pair of blankets behind our saddles, and, taking a sack of provisions and a coffee-pot, are soon on our way. The first ten miles of our journey leads us through a country much traveled by herders and hay-makers, and hence destitute of game; but before long we begin to see antelope in small numbers feeding on the prairie. One old buck, which was slowly walking along directly in our path, seemed disposed to investigate us and waited, watching us most intently, until we were within four hundred yards of him. As I was anxious to try my new Sharps rifle, I dismounted to take a shot at him, but as soon as I halted he ran about one hundred yards away and then stopped again, quivering from me with his head turned back. Throwing up my sights to five hundred yards I fired with great care, and in a moment the buck started and ran like the wind, soon passing over a little swell and out of my sight. I turned to mount and asked Reed where the ball struck. Seated on his horse he could see the antelope much further than I could, and he replied, "By Jove, you killed him." And so it was; for, after riding on for some distance, we came upon our quarry lying on his knees quite dead. The ball had hit him to the right of the tail and had raged through him, coming out at the shoulder—a lucky shot. The horns were soon transferred to our saddles, and we proceeded on our way, reaching the foot of the mountains about three o'clock in the afternoon. Here, near a beautiful spring, we determined to camp, and, leaving our horses and meagre camp equipage, started out on foot to look for deer and elk. Four hours' hard mountain climbing, over rocks, through thick brush and among fallen timber failed to reveal any game or any signs of its recent presence, and we returned to camp discouraged. The mountains were lovely where we camped, and would have detained us for some time had we come prepared for collecting. The dusky grouse was especially abundant, old females with their half-grown young being started at short intervals. Clark's crow, too, was seen and heard very often, besides many other mountain birds. Bear tracks and other indications of their presence were seen, but none of the "signs" were fresh enough to warrant our spending much time in looking them up.

The following day was devoted to a thorough investigation of Codes, Little and Elk mountains, with the same results as before. A few fresh elk tracks were found, but it soon became evident that game was by no means abundant here. Two months later the hunt would have turned out very differently, but the game was as yet far to the southward amid the high mountains that wall in North Park. So we turned our faces toward the plain again and spent several days hunting antelope, which were very abundant. It would be a pleasant task to narrate to you the incidents of these few days, but time and space warn me to close this letter. It is enough to say that we returned to Mr. Jones well laden with meat and bearing several fine bucks' heads as trophies of our hunt at the foot of Elk Mountain. Yo.

Elk Mountain, via Medicine Bow, Wyoming.

GAME PROTECTION.

CLOSE SEASONS FOR FISH AND GAME.

SEVERAL weeks ago, with the view of preparing for our readers a comprehensive and authoritative compendium of the close seasons for fish and game throughout the country, we requested of the Secretaries of the several States and Territories authentic information. To this request the most of them have kindly responded, and we take great pleasure in here acknowledging their courtesy. We give below an abstract of the statutes thus obtained. In some cases, where we have failed to secure the attention of State officials, we have compiled the laws from other and less reliable sources. The dates given below we believe to be trustworthy. It must be remembered that in many States there are special county and local modifications of the general State law. We shall shortly publish this information in the form of a tabulated statement for the use of game protective societies and all others who may desire it.

ALABAMA.—Deer, April 15 to September 15; fowl, April 1 to October 1; quail, April 1 to October 1; wild turkey, April 1 to September 15. These provisions relate only to the counties of Mobile, Choctaw, Monroe, Clarke, Washington, Baldwin, Marengo, Lowndes, Sumter, Escambia, Hale, Dallas, Montgomery and Greene.

CALIFORNIA.—Salmon, August 1 to September 15; salt or trout, November 1 to April 1; shad, April 1 to December 31;

trout, November 1 to April 1; antelope and deer, until March 30, 1882; fowl and quail, March 15 to September 15, except in Loson, Plumas and Sierra counties; in San Bernardino and Los Angeles counties, April 1 to August 1.

COLORADO.—Elk, buffalo, deer, antelope, mountain sheep and bison, January 1 to September 1; pinnated grouse, pheasant and prairie hen or grouse, November 15 to October 1.

CONNECTICUT.—Black bass, May 31 to July 1 (in Connecticut and Farmington Rivers may be taken at any time); salmon, none taken under nine pounds; shad, June 25 to March 15; trout, July 1 to April 15; quail, ruffed grouse and woodcock, January 1 to October 1.

DELAWARE.—Rabbit, partridge and pheasant in Kent and Sussex counties, February 15 to November 1; in New Castle county, January 1 to November 1; woodcock, January 1 to July 1.

FLORIDA.—No law for fish except one requiring non-residents to procure a license; deer, April 1 to September 1; no sea birds or birds of plumage may be killed; wild turkey, April 1 to September 1.

IDAHO.—Fowl in Ada county, April 15 to September 1; pinnated grouse in Ada county, March 1 to August 1; quail, April 1 to September 1.

ILLINOIS.—Deer, February 1 to October 1; geese, May 1 to August 15; pinnated grouse, January 15 to September 1; quail, February 1 to November 1; ruffed grouse, February 1 to October 1; snipe, May 1 to August 15; wild turkey, February 1 to October 1; woodcock, January 1 to September 1.

INDIANA.—Deer, January 1 to October 1; fowl, April 15 to September 1; quail, January 1 to November 1; pinnated grouse, February 1 to October 1; woodcock, January 1 to July 1; wild turkey, March 1 to September 1.

IOWA.—Black bass, April 1 to June 1; salmon, November 1 to February 1; deer and elk, January 1 to September 1; fowl and geese, May 1 to August 15; pinnated grouse, December 1 to September 1; quail, ruffed grouse and wild turkey, January 1 to October 1; snipe, May 1 to August 15; woodcock, January 1 to July 10. No person to kill more than 25 grouse, quail, snipe or plover in one day.

KANSAS.—Pinnated grouse, February 1 to July 31; quail, January 1 to September 30. Killing of plover, ruffed grouse, wild turkey and woodcock prohibited at all times.

KENTUCKY.—Deer, March 1 to September 1; squirrel, February 1 to June 15; rabbit, February 1 to October 20; fowl, January 1 to October 1; snipe, May 1 to August 15; plover, February 1 to October 20; woodcock, February 1 to August 15; doves, February 1 to August 1; wild turkey, February 1 to September 1.

LOUISIANA.—Deer, February 1 to August 1; quail, April 1 to September 15; wild turkey, April 1 to September 1.

MAINE.—Black bass, April 1 to July 1; land-locked salmon, September 21 to February 1; in St. Croix River and tributaries, September 15 to February 1, and in Moosehead and Penobscot waters, September 21 to June 1; salmon and shad, July 15 to April 1; togue and trout, see land-locked salmon; caribou and deer, January 1 to October 1; moose, until 1880; fowl and plover, May 1 to September 1; pinnated grouse (possession), January 1 to September 1; ruffed grouse, snipe and woodcock, December 1 to September 1.

MASSACHUSETTS.—Black bass, December 1 to July 1; land-locked salmon, October 1 to April 1; salmon, until April 7, 1880; lake trout, October 1 to April 1; shad in the Merrimack, June 10 to March 1; in the Connecticut, August 1 to March 15; trout, October 1 to April 1; deer, until January 1, 1880; fowl, April 15 to September 1; pinnated grouse shooting allowed only on one's own land; plover, January 1 to July 1; quail, January 1 to September 1; ruffed grouse and woodcock, January 1 to September 1.

MICHIGAN.—Trout, September 1 to May 1; grayling, November 1 to June 1; deer in Upper Peninsula, November 15 to August 1; Lower Peninsula, December 15 to September 15; fowl, January 1 to September 1; pinnated grouse, January 1 to September 1; quail, January 1 to October 1; ruffed grouse, January 1 to September 1; wild turkey, January 1 to October 1; woodcock, January 1 to July 1.

MINNESOTA.—Trout, April 1 to September 30; antelope, deer and moose, November 1 to December 15; fowl, September 1 to May 15; pinnated grouse, August 14 to September 30; quail and ruffed grouse, September 1 to November 30; July 3 to October 31.

MISSISSIPPI.—Deer, March 15 to September 15; quail, March 15 to September 15; dove and stalling, April 1 to September 15.

MISSOURI.—Deer, January 15 to September 1; pinnated grouse, February 1 to August 15; plover, February 1 to August 1; quail and ruffed grouse, February 1 to October 15; wild turkey, March 1 to September 15; woodcock, January 1 to July 1.

MONTANA.—Pinnated grouse, ruffed grouse and quail, March 1 to August 1.

NEBRASKA.—Buffalo, elk, mountain sheep, deer and antelope, January 1 to October 1. No wild birds save only water fowl, jack-snipe, sand-snipe, waders and woodcock can be taken at any time of the year.

NEVADA.—Trout and salmon trout, January 1 to September 1; deer, antelope, elk, mountain sheep or goat, January 1 to July 1; pinnated grouse, partridge, pheasant, woodcock, grouse, quail, fowl, geese, sandhill crane, plover and curlew, April 1 to September 1; sage chicken or snipe, April 1 to August 1.

NEW HAMPSHIRE.—Black bass, May 1 to June 30; muscologne, December 1 to May 31; pickerel, March 1 to May 31; pike, December 1 to May 31; salmon trout and speckled trout, September 1 to April 30; deer, January 1 to August 1; moose, February 1 to October 1; plover, quail and ruffed grouse, February 1 to August 1; woodcock, February 1 to July 1.

NEW JERSEY.—Salmon trout and speckled trout, October 1 to March 1; black bass, April 1 to July 1; pike or pickerel, March 1 to May 1; deer, December 1 to October 15; squirrels, January 1 to July 1; rabbit, January 1 to November 1; quail and pheasant, January 1 to November 1; woodcock, January 1 to July 4; rail, December 1 to September 1; red birds, December 1 to August 15; upland plover, January 1 to August 1; prairie chickens, until 1880.

NEW YORK.—Black bass, Oswego bass and muscologne, January 1 to May 30; trout, September 1 to April 1; salmon trout, October 1 to March 1; deer and moose, January 1 to September 1; fowl and geese, May 1 to September 1; quail, January 1 to November 1; woodcock, January 1 to August 1; on Long Island, January 1 to July 2.

NORTH CAROLINA.—Trout, October 15 to December 30, in the counties west of the Blue Ridge; partridge, quail, doves and wild turkeys, April 1 to October 1. This applies only to the counties of Davidson, Randolph, Rowan, Anson, Warren, Guilford, Rockingham, Orange, Caswell, Mecklenburg, Edgecombe and Carabarra.

from his surprise, the captain began hauling in his line, and after ten minutes' hard labor secured the bird. This exploit was equalled by that of a Gloucester, Mass., youth who shot a seal in the Squan River last week, and wheeled it home on a wheelbarrow.

THE MINISTERIAL WHITEBAIT DINNER.—We print the fish portion of the *menu* of the ministerial dinner given at Greenwhich, England. We have no doubt but that quite as good a dinner can be had at Brighton Beach. Earl Beaconsfield no longer can revel in whitebait alone. Mr. E. G. Blackford, in the most brutal Republican way, has deprived English Ministers of the monopoly of whitebait dinners. What is amusing about all this is that the *London Spectator*, because the bill of fare is written in old English, dates the decadence of Great Britain from the un-English character of the *menu*:

YE ANNUAL WHITEBAIT DINNER

YE HONORABLE MINISTERS

Wednesday, Ye 14th August, 1878.

At ye Hotel de Ville, London.

Ye SUPPER was QUEENWITHE.

This Bill of ye Fare is drawn in playne English, without any dooks of Frenche or other foreygn tongue, for the sabbid and sobere comfort of frendes, and that ye maye know what ye are asked to accept.

YE BILLS OF YE FAIRE.
YE SOUPE.
Soupe made from ye TORTLE, and alsoe Soupe made from ye Greene Fatte of ye same.

YE FISHES.
Ye FLOONDERS curiously cooked, and SALMONNE served inno lyke manere.
Ryssoles of ye LOBSTERE. Ye lytel SOLES fried.

Ye Puddinge of ye WHITTING. Ye EGGS skinned & stewed inno lyke manere.
Ye Omelette of CRABBE inno ye style as served to ye Guardes of ye line castle.

Ye TROUT from ye River Rye, served with ye sauce of Tartar.
SALMONNE inno collops, with ye sauce inno ye cyprus fashione.

Ye WHYTEBAIT, be-trizzled & alsoe be-devyiled.
Ye Dinner will be served after ye manere of ye Russian people.

THE RIO FOR BASS.—*Editor Forest and Stream:* In black bass fishing a short rod is always the best if it is long enough to get your flies where you want them. Bass fishing is mostly carried on from a boat, and a long rod in a boat is a nuisance. Black bass almost, if not always, as they are brought near the boat, make a dash and try to run under the boat, and a long rod is then a hindrance to turn them around the end of the boat and where the anchor is not, by the way, if possible. Bass are bold biters when they do bite, and are just as likely to bite or rise at a fly quite near you or the boat as at a distance. I believe they are not scattered around, but are much more apt to be collected in some considerable numbers together. Bass do not seem to be at all timid about a boat or anything, but are very notional biting or taking the bait, and when they have a notion to have a notion to be using of not more than two flies on a six-foot leader (casting lines some call them), and not trying to make long casts. Try to find where the fish are, and so handle them with a short line if possible, but "let him have his head" for the first run with your finger on the line, giving it an easy pressure so as to drag him a little at first, and then, as he increases the pressure, so as to get too near any obstructions. You will notice, I think, that he will go into the air and "stand on his tail" when you first strike him, either with a fly or bait, and is very apt to do the same each time you bring him up at the end of a run. Then you must look out that he does not get too much slack line on you. The instant he goes into the air just pull him over into the water where he belongs, and at the same time "keep him coming," but do this carefully without too sharp or too strong motions. After a few runs you may be able to bring him near the boat, then look over, or he will go under it in spite of you, breaking your rod or line. With skillful care just pass him around the other side of the boat. I think usually the fish won't try this more than once or twice before he will turn over on his side. Now he is ready for the landing net, and so pass him out and go for another. C. F. ORVIS.

Manchester, Vt., Aug. 1, 1878.

"A TOUCH OF NATURE."—Mr. George Dawson, the editor of the *Albany Evening Journal*, has been on a grayling expedition among the woods and waters of Michigan. In his travels there he fell in with some of the lumbermen, who are, for the first time in that region, working through the summer. Many of our readers in their summer wanderings have come across just such characters as this:

Scores of these sturdy workers were on the cars for their several camps, and they seemed gratified that there was this unexpected demand for their willing service. A little incident shows what affectionate recollections even the humblest retain of their old homes. One of them suspected that I was from "York State," and, seeing my bundle of rods, fancied, also, that I might have visited some of the forest localities with which he was familiar. When I assured him I knew every foot of the territory he referred to, he "froze to me" like an old friend and was greatly delighted.

"Ever on Little Tupper?" was his first direct question.
"Oh, yes, both Big and Little, often."
"Bully places those air. No such lakes in these parts, nor trout neither. I'd climb the back of a hog in the woods to see one such as I've tuck in Little Tupper. Ever fished in the Racket?"

"Every foot of it."
"Know the Little Bog?"
"I've been there often."

"Hail Columbia! I used to live right 'round thar. Ever meet Joe Peiser?"

"Oh, yes, I had his team once to take me to Canton." Jumping up with a "whoop!" which startled the crowd, he held up his black bottle toward me as if he were tendering me a kingdom and wished it was a continent, with the simple remark:

"I say, pard, won't you take a drink?"

I begged to be excused, and averted further importunity for the moment, by saying:

"Did you ever know 'Tom Cole, who used to live, years ago, on the Potomac?"

On this question my friend looked at me with the most comical expression of surprise and admiration. His face lit up like a pine knot, and his eyes became liquid as a running

brook, as old recollections seemed to crowd upon him like a log-jam in a spring freshet. When speech came to him he exclaimed:

"Jerusalem! Did you know Tom? Why, I've bunked with him in every sanny in the North Woods."

And then, with an intense earnestness which lifted the comic into the sublime, he sang, in a full, clear voice, a verse of "Father, come home," as if he would have been the happiest man on the globe if, at that moment, he could have taken his old friend by the hand, and stood once more on the shady banks of Big Tupper; and then, in a tone as full of pathos as the minor key of a funeral dirge, he said to me:

"Squire, hope to God I won't slide the chule until I get back home again!"

When I reached my destination, determined in some way to express his gratitude, he followed me to the platform with the remark:

"I say, chummy, if you won't take a drink, you'll let me carry your traps to the shanty, won't you?"

And he did. On leaving me the good fellow shook my hand with a pressure which made it feel as if it had found its way into the fresh cleft of an oak rail cut. And "I saw his face no more."

A STRING OF FISH.

A Montreal correspondent sends us this clipping and asks if it can be credited:

Mr. Charles Lechay, of Gananogue, Ont., an oarsman, had a most desperate encounter with a maskinonge on Monday on the river, a little below Granite Island. When Mr. Lechay galled the monster he made straight at him, breaking his leg and frightfully lacerating his arm, and his clothes were literally torn off him; and had it not been for the timely assistance of Mr. Frank Lolond (another oarsman) the fish would have killed him. The monster measured 11 feet 8 inches, and weighs 589 pounds.

Yes; we should think the story substantially true. We never before heard of a "maskinonge" 118 yards long and weighing 589 tons. But then every one knows that there are bigger fish about Gananogue than were ever caught anywhere else. It is remarkable that the fish should have swallowed the two men and the boats, but the very fact that the oarsmen made faces at the monster may account for this mad freak. In pleasing contrast to the ferocity and bloodthirstiness of the Gananogue "maskinonge," a most dangerous beast, is the tender love towards the human race displayed by the pickered of Clear Lake:

Living at Clear Lake is a family who have a little girl who takes daily rides on the lake in a small skiff drawn by two pickered. They are regularly harnessed, and by means of lines she is enabled to guide them in any direction desired. The fish are about three feet in length, weigh between seven and eight pounds each, and are very powerful. The rapidity with which they skim through the water with the boat and its precious cargo is said to exceed in swiftness the fastest sail boat that has been placed on the lake. When the girl has tired of riding she drives the pickered to a boat-house, where they are unharnessed, taken into a commodious glass aquarium and fed. When she visits the tank to harness them for a ride the pickered jump almost into her arms, so glad, apparently, are they to see her. The young miss has been offered \$1,000 for her strange team, but no money would induce her to part with them.

Beautiful, is it not! And note the effect of the indefiniteness of the locality. "Clear Lake" to add the State would destroy the charm. Who wants to know where Fairy Land is, or who would put his finger upon the exact spot on the map where it all happened "once upon a time, in a land, O over so far away." These, be it remembered, were only coarse pickered. If we find such sentiments beneath rough exteriors what may we not look for—through the magic glasses of the reporter—in the presumably finer natures of the tender trout, *Salmo fontinalis*, speckled beauty, *Yenuseta maculata*? Toughened indeed must be the wretch who can read this truthful and touching incident without a copious weep:

One of the most remarkable evidences that fishes possess reasoning power is related to us by a reliable gentleman which we hasten to lay before our readers.

Our informant has on his grounds an artificial trout pond which contains at least 3,000 spotted beauties, weighing from a half to two pounds each. The gentleman has a little daughter, five years of age, who may well be called the queen of the speckled beauties. This little miss has succeeded in training the fish so that she can go to the edge of the pond and with a handful of crumbs feed them from her chubby fat hand. The fish have learned to jump out of the water and snatch a worm from her fingers. They seem exceedingly fond of her—they are said to perfectly adore their little queen. On Thursday last she was standing near the edge of the pond, where the water was quite deep. While reaching over to drop a few crumbs to her subjects, she suddenly lost her balance and pitched headlong into the water. She says that she "went way down," when she felt something underneath her and she quickly rose to the surface, where she put her little lungs to their utmost test and called lustily for help. Her cries quickly attracted her parents, and they were horrified at seeing the little girl floating upon the surface of the pond. The father rushed quickly to the water's edge and reached out for his treasure, and as he raised her from the water a perfect solid mass of trout was found beneath her. These faithful subjects of the little queen as she fell quickly gathered beneath her and she showed their love for their mistress by bearing up her body until aid arrived, thus preventing her from meeting a watery grave, which she would have otherwise done. Parents who have little ones can imagine the parents' love for these trout, when they remember that their sagacity saved the life of their little daughter.

For Forest and Stream and Rod and Gun.

A TENNESSEE FISHING CLUB.

MANY years ago, long before clubs were known in the far off Southwestern country, a party of gentlemen of this place banded themselves together, and for many years passed several weeks of each spring and autumn in the delightful recreation of angling. The party numbered some seven or eight, and were noted for the harmonious manner in

which, year after year, they quietly made their preparations for their first campaign. Two of the gentlemen were distinguished divines of the Methodist Church; the others were leading merchants of the city. They were provided with a complete camp equipage, for they went at their favorite amusement in true sportsman-like manner. They fished in most of the principal streams of this State—the Cumberland, Harpeth, Elk, Flint, and Tennessee rivers, besides Turnbull, Mill and other creeks. For the larger streams they had boats to convey them from point to point, and for navigating the smaller streams they had a boat which served also as the body for their fishing wagon. Their tackle was of the best and most improved make, Canoy's, Meeks' and other reels; grass, linen and silk lines, Limerick hooks, with snoods of various colors to match the different stages of the water; jointed rods, minnow seines, buckets, landing nets and hooks, artificial flies and tawls, in fact everything that could be suggested to make up an angler's kit. In addition to the above mentioned paraphernalia, these gentlemen were all experts in the art of angling. The streams in which they fished were well stocked with black and striped bass, black perch, drum and jack, to say nothing of eels, turtle and catfish. To say that they were always fortunate in taking great numbers of fish is almost superfluous, for the reason that they never ceased fishing until they did catch a good number. But with all that nature had done for their sport, and science had aided it in, they were prudent enough not to depend solely upon chance, and in consequence never forgot to start with a well filled larder and a few unostentatious flasks of Robertson and Lincoln Counties best brew to make good any shortcomings on the part of the elements or the capricious finny tribe that they were after.

That equipped they would seek some good ground where to pick their tents, near a farm if possible, so that they could get their supplies of milk and butter. Once settled, the first part of the programme was the securing of minnows. Each one had his bucket and favorite spot to fish, and away they would go, only to meet at some given place about the hour of noon, when, as a rule, the fish would cease to bite, and they could take advantage of this respite for luncheon and a rest. It would fill volumes to give a literal account of all their exploits, and we cannot do so, but we are getting an account of some of the gentlemen composing this exclusive angling association, and an anecdote or two told upon one of more of them on some of their expeditions. The two D. D.'s were the exact opposites in form and disposition; the one was a fine-looking, portly person, cool and self-possessed, with a peculiar voice, much like that of a female, but a most patient and scientific fisherman; the other was a person of diminutive stature, nervous and believing in the efficacy of a good trout-ting great deal in it. When the fish would not bite he would make the woods ring with some old-fashioned cantering hymn, his voice sounding more like that of a giant than one we should fancy belonging to him. Then there was W. A., an excitable individual, at times rather irritable, but a good fellow and an excellent fisherman; J. M. A., a quiet and retiring party, but full of fun and always ready to give a good joke; L. G., a solemn character, who was not conversively so, a hard worker, and, as a result, a lucky sportsman.

A notable member of the association was one who wore a military title—I say wore it, because he assumed it with a degree of pomp and style quite befitting the rank allotted him. He hated water, that is to say, he disliked going into it with the other members when minnows were to be caught, or a boat launched or beached, or any emergency when called upon. He was a member of the association, but he was not a fisherman. One day he lost a fine fish, or his hook caught in a rock, or something such trouble had happened him. Just in the midst of his rage the military member called upon him to put him across the stream in the little wagon boat. "All right," says W. A.; "but you know this craft is fearfully crank—a sudden shift of your quid will capsize it—so you must be on your guard or you will get into your much-deadened element." With such a warning he made at first a man of his own mind, and then he and off she darted into the stream, but he was not long and gotten half way across, over she tipped, and into the rushing stream was our military man thrown. There he was, floundering like a great fish, swearing all the oaths known to a regular old salt. Whether W. A. did this to palliate his anger or was it the result of accident, I could never learn. I doubt, however, if the military man ever believed that it was. The same gentleman was once the cause of a good deal of merriment in the camp because of a rather ridiculous incident of a well-intentioned effort to secure some game to his reel. It was an exceedingly hot day in September, and upon the banks of Stone's River, that the patience of our hero had been well exhausted—fishing with all kinds of bait, such as minnows, earth worms, flies, etc., to no purpose, not even a nibble to reward him. Just at this moment he fancied he saw in the grass close by him a little green frog. He looked again, and there was the frog, sure enough. "Ah! ah! my little joker, if I can but lay my hands upon you I would offer you as a temptation, which I know some noble jack could not refuse; so here goes, and I will catch you if I can." After some little scampering about, and with the aid of his broad-brimmed Panama, he succeeded in capturing the innocent frog. Placing him carefully upon his hook, he next proceeded to cast him into the water, but he was so awkwardly managed that he fell on his back or bass or jack) nearly on his side, and he was not long in getting up. His cast was perfect, and there stood our friend, rod in hand, reaching as far as possible out into the stream, with the clear setting sun shining full in his face, which was, from that cause and excitement, as red as a beet, waiting patiently for the expected bite; but he waited in vain. "No bite! How can this be?" What was his disgust when H. G., coming up the opposite bank, discovered that the frog was in the water, and had swam out to the bank, which it had climbed up and was sitting there, apparently meditating upon the cruel nature of the human race and in full view of his persecutor. If it were not for fear of tiring the patience of my readers I could give a dozen or more of just such embarrassing situations that happened not only to the military member, but to all the others. As it is, I had better tell about Col. H.'s experience with a young lady of Julia river, who was a friend of his in New York, knowing the old gentleman's fondness for fishing, and knowing his favorite way to wade out into the stream, sent him a pair of the above-mentioned trousers, with boots and breeches together. Old Nick, as everybody called him, was delighted. "Now I can go with the boys," said he; "no fear of rheumatism or ague with such waterproofs as these. I can take the stream and be as dry as a powder-horn."

With such cooling thoughts in his mind, he climbed up and down the stream, and in hand stepped out into the water, the place where he entered the stream was very rapid water, about eighteen inches deep. The bottom was rocky, with green,

slimy moss growing upon it. He thought, however, that it was soft, and pushed ahead, his friends in the meantime watching to see the result of his new rig. They had not long to wait, as the old gentleman's feet flew from under him and down he came, and there he was, in great danger of drowning, the breeches filled with water and the old man powerless to help himself. His friends in the meantime were so convulsed with laughter as to be unable for a few moments to go to his rescue. At length he was taken out, and this ended his fishing career.

Nashville, Tenn., Aug. 1878.

NOTES (Condensed).

- That this move is not better than the recognized continuation of 6-B-K3 is specially shown.
- Rather venturesome.
- R-K3 is preferable.
- I favor K-K4.
- This move prevents Black exchanging Queens save at the expense of a piece.
- Either resign or play Q-K5, which allows of a further struggle.—*Westminster Papers.*

CURSEY JOTTINGS.

The Derbyshire Chess Column of Aug. 8 is devoted entirely to American chess matters. We endorse a portion of that which contains the balance we view with disapproval. The *Turf* observed: "That it is the impartial judgment that our representatives have not been out-played, and that their misfortune must be ascribed to some other cause than lack of ability, etc." This is published in the Derbyshire Chess Column with the appended comments thereon: "What this 'some other cause' may be, of course we cannot even guess at, but our readers will have some idea of the chronic state of brag that just now obtains in the States from the fact that this article is being copied into other American Journals [kindly give names of some?] and that MacKenzie is Chess Editor of the *Turf*." Oh, Derbyshire, did not MacKenzie score one and one-half games against Zukertort, one and one-half games against Winawer, one game against both Blackburne and Bird, and then two consecutive games, in playing off a tie, against Biel? Are not these straw whereon to express an "impartial judgment?" What would have been the "impartial judgment" of the Derbyshire Chess Column had MacKenzie represented Derby at the Paris Tourney? We repeat that you would have devoted an entire column to the subject, and kept it up for weeks thereafter. Had you treated the matter as did the *Turf* you would not have indulged in brag. "Brag just now obtains in the States"—indeed! This affords us a seasonable opportunity to remind the Derbyshire Chess Editor that he has indulged in brag—we refer to his articles on Reichenbach's later and 1000. This brag has had facts at its back, and English solving ability is just a matter of pride. We "acknowledge the corn" in that instance, and we also parenthetically state that Andrews is a first-class problemist, solver, critic and umpire, and that Messrs. Pierce and Meyer are also good problemists and solvers. But why did you so present the subject to your readers in a manner that left open no fair inference to your readers other than that MacKenzie wrote this "impartial criticism?" Hardly the fair thing to do, knowing as you must have, that Mr. MacKenzie did not conduct the *Turf* chess column while engaged in play at the Paris Tourney. While we admire Thompson's pluck, enthusiasm and ability, we cannot applaud or even silently wink at his indiscriminate and unfair attack upon American chess in that exceptional cases are made to appear as illustrations of American chess players

generally. It is not our intention to provoke a discussion with the Derbyshire Chess Column by the above or our closing observation, that friend Thompson sometimes goes off before even a half cock.

The winners of the prizes in the problem tourney of the *Reichs-Deutscher Schach Club*, of Italy, are: first, G. B. Valle, Spezia; second, A. Abela, Malaga, Spain; third, M. Oberman, Leipzig, Germany.

The English manager of the International Tourney intends to publish games, etc.—he having discontinued his column in the Glasgow *News of the Week*—in the *Argus and Express* chess column, of Ayr, Scotland.

Mr. Morton's chess column in that paper is conducted with rare ability.

The *Westminster Paper* for August gives a portrait of Mr. Winawer, the celebrated Russo-Polish chess player, and about sixty games played at Paris. It is a valuable number, and should be in the hands of every chess player.

Game No. 74.—RUY LOPEZ—BIRD'S DEFENCE.

Final round. Played July 23, 1878:

White.	Black.	White.	Black.
Mason.	Bird.	Mason.	Bird.
1—P-K4	1—P-K4	20—K-K3	20—K-K3
2—K-K3	2—K-K3	21—K-K3	21—K-K3
3—K-K3	3—K-K3	22—K-K3	22—K-K3

15—K-K3	15—K-K3	34—K-K3	34—K-K3
16—K-K3	16—K-K3	35—K-K3	35—K-K3
17—K-K3	17—K-K3	36—K-K3	36—K-K3
18—K-K3	18—K-K3	37—K-K3	37—K-K3
19—K-K3	19—K-K3	38—K-K3	38—K-K3

NOTES.

- This is altogether premature. P-Q3 is the correct continuation.
- Possibly necessary after the last move, and, no doubt, intended as its foilower, but it only shows how completely the nature of the opening has been misconceived. Mr. Mason possesses many of the qualities of a really strong player, and particularly he is by no means apt to break down under difficulties, but he certainly lacks what is called judgment.
- Which is obviously a sign of weakness.
- This P seems likely, either directly or indirectly, to work considerable mischief.
- He cannot stand against R-K3 while the K remains at R, but B-K3 would appear to be more hopeful than the text move.
- Which of course wins.
- This game is a good specimen of Mr. Bird's vigorous, if somewhat loose, style. Careful elaboration is not a quality that he goes in for, and as long as his opponent's game is broken up, he does not seem to mind his own being in various places.—*Westminster Papers.*

CORRECTION OF PROBLEM NO. 23.—Remove White's Queen at the board, and place White's King on Q's 8th square.

New Publications.

BYRNE'S TIMBER AND LOG BOOK. By Oliver Byrne, C. E. The American News Company: New York.

This is a handy little work and ready-reckoner, which is useful alike to the merchant, mechanic and trader. Its use will economize time and labor, and the great variety of tables contained will cover a large field of inquiry. To shipbuilders and yacht-builders or designers we can especially commend the pages on board-measure, timber and plank measure, the cubical contents of spars and round timber generally; as well as the tables of wages, which will assist materially in keeping the accounts of the building yard. Weights, foreign measures compared with American, tables of interest, and tables showing the value of any number of pounds of cotton at different prices, or of any number of articles at different prices, will render the book welcome at the desk of merchants and traders generally. On all these matters the book may be accepted as a standard. It may be carried easily in the pocket, and its price of 35c. places it within reach of all.

HISTORICAL AND BIOGRAPHICAL ATLAS OF NEW JERSEY COAST. Illustrated. By Woolman & Rose, Philadelphia. Price 57c.

As the name indicates, this work contains a mass of information of interest to all who are or may be connected in any way with the coast of New Jersey, either as proprietors of land, sportsmen, or yachtsmen. It is intended to preserve in accessible form a record of the past and present condition of the coast line, including a strip of land, ten miles wide, from New York to Cape May. The historical and biographical portions of the work have been carefully compiled from the most authentic sources by Mr. T. T. Price, M.D., of Tuckerton, Burlington Co., and Mr. Bernard Cooper, of Freehold, Monmouth Co., both gentlemen well known, and fully competent, by their long residence and wide acquaintance in the State, of acceptably filling the task undertaken. Through them many incidents concerning the Revolution, and reminiscences of fact relating to the lives of the first settlers now first reach the light of publication. A series of maps of the coast and harbors, taken by permission from the United States Coast Survey, are the only complete maps of the Jersey coast ever published. They form a most valuable feature of the work, and are worth as much as is asked for the entire work—certainly they could not be bought separately for any like sum. Besides a detail map of the entire State and adjacent counties of New York and Pennsylvania, we have in this book a series of six separate charts of the coast line as far down as Cape May, with all the soundings, lights, buoys, fishing and hunting stations, towns, counties, roads, railroads, and position of wrecks marked out, which, together with the innumerable illustrations of villages and summer resorts, form a most valuable collection of matter, alike interesting to the sportsman, farmer, country gentleman and yachtsman. Accompanying the rest is an old-time chart of 1812, taken from Capt. Gibbons' "Chart Book," which will form a basis for instructive comparison of the changes taken place within the last fifty years. Old islands have disappeared; others opened in their stead. Large areas of beach land have sunk, and new formations created, while, of course, the number of lights and buoys have vastly increased, and what was once a dangerous coast has been shorn of its worst features, so far as the most perfect lighthouse system in the world can effect. To the life-saving stations much attention has been

bestowed. The origin and improvements in the service stations, their locality and furnishing, with rules for the guidance of the shipwrecked; will be found of immediate benefit to all who coast along the Jersey shores for profit or for pleasure. The profuse illustrations throughout the volume will serve to give an adequate idea of the wonderful and rapid development in number and importance of the summer resorts that dot the beaches of favored New Jersey. They will serve better to select one's summer abode than any number of advertisements or descriptive articles could do. The local history has been obtained from resident citizens, and is fuller probably than anything heretofore published. Besides seventeen charts and maps, the reader will find accurate and detailed plans of no less than thirty-two towns and villages, showing divisions in lots, and their owners, with the means of access to them. Statistics, covering all the industries, population, schools, light-houses, wrecks, yachts and yacht clubs, inventions, etc., add to make the book one of the most prolific works of reference recently published. The yachting public will find in the rear a coast survey chart of New York Bay and Raritan Bay, with a list of coast waters, including the Sound as far as Throggs Neck—a useful appendage. Taken as a whole, the book can be recommended to all whose interests are identified, permanently or temporarily, with the coast of New Jersey, in its past, present, or future. It is printed in clear type, charts in color, and bound in a serviceable and handsome manner. A specimen copy can be sent at our office.

AROUND THE WORLD IN THE YACHT "SUNBEAM." By Mrs. Brassey. New York: Henry Holt & Co., 25 Bond st.

Hackneyed descriptions of travels over well-trodden roads the world has brought forth innumerable, but it has remained for Mrs. Brassey, wife of one of the well-known engineer and employer of labor, Mr. Thos. Brassey, to open to the public paths in literature, entirely new and heretofore unexplored. Mr. Thos. Brassey, M.P., who, as a successful yachtsman and navigator, is a standing example for all amateurs to follow, in his account of the *Sunbeam's* cruise around the world has confined himself to matters more or less of a professional nature, branching out here and there into politico-economical considerations in connection with the countries visited. Mrs. Brassey, who is thoroughly in accord with the spirit animating her husband, has, on the contrary, given us, in her book of the same voyage, a pleasantly and ably written diary of strange lands and people, as well as of life at sea as it appeared to a woman of close and intelligent observation. At times, her very practical suggestions and wiser deductions reveal a shade of character bordering upon sound executive or administrative qualifications, which it is too often presumed are wanting in the softer sex. At the same time, there is nothing in Mrs. Brassey's views elicited by the happenings during their protracted voyage, which is in the least unwomanly. The occasional assertion of her rights among not over-scrupulous strangers, and the means she took to maintain them—as, for instance, when shabbily treated by mine host at Santiago, Chili—are pleasing insights into the energy of character which even many men would do well to display oftener for their individual benefit and the protection of the general public. The descriptive talents of Mrs. Brassey are marked by their clearness and terseness, and are fortunately free from that rapid inflation of words, so often met with in books of travel, whose effect is that of a meaningless attempt at padding or romantic fiction rather than a truth-conveying analysis of the actual condition of things. Moreover, in so far as Mrs. Brassey relates the doings aboard the yacht, the public may put entire faith in their value as specimens of professional competence, seldom, if ever, attained by a lady without in the least sacrificing any of the qualities which render the gentler sex the admiration of men. Without doubt, Mrs. Brassey is sailor enough to teach many of her readers who may pride themselves on their nautical acquirements some lessons which they may take to heart with advantage to their standing as seamen or pilots. The book is as full of interest to the yachtsman as to the family fire-side, and it has been brought out in attractive form with illustrations by the publishers.

WINGATE'S RIFLE PRACTICE—MANUAL FOR RIFLE PRACTICE. By Gen. Geo. W. Wingate, General Inspector of Rifle Practice. N. G. S. N. Y. Sixth revised edition. New York: W. C. & F. P. Church. 1878.

The author of the "Manual for Rifle Practice" has been fortunate enough during the last few years to see three things, which, as one of the originators of rifle practice in the United States, must have been more or less flattering to him: Firstly, from a very small beginning in New York, rifle practice has extended all over the United States; secondly, the rules and regulations governing rifle shooting have had for their source the limits laid down by the National Rifle Association; and, thirdly, the "Manual" has, in a surprisingly short time, entered on its sixth edition. Both practically and scientifically, General Wingate, from his position of Inspector of Rifle Practice, is admirably capacitated for the work undertaken. The book has not stood still with its first edition, but as changes and new regulations have been introduced in the use of the rifle as a military arm, fresh and interesting matter has been added to the "Manual." One great excellence of the work is that the rifleman, whether as a military or a non-military man, can find in it exactly what he wants. Our Journal is constantly requested to give to new organizations hints and ideas how to increase the efficiency of members on the range. Wingate's "Manual," in its "Suggestions to Marksmen," has an appendix which is invaluable. As it is, General Wingate's "Manual," and the method, philosophy and practice it inculcates, have been so thoroughly appreciated that the system designated in the school of the rifle has now been officially adopted in Massachusetts, Connecticut, Vermont, New York, New Jersey, Illinois, California and Louisiana. The greatest compliment that can be paid to the book is that the "Manual" is considered and used as a standard work in both the Navy and Regular Army.

GOOSE.—We have lately seen somewhere—we don't exactly remember where—the wood-cut of a strange bird. It bears under it this legend, which has helped us considerably: "Anser hypoboreus—Snow Goose." We are glad to be so informed, because we felt it was no-goose.

ORONOGA COUNTY AGRICULTURAL SOCIETY.—The first annual fair will be held at Syracuse on the 17th, 18th and 19th of September. In a hippic way the programme is superb.

HANGING A HAMMOCK.—Every well-to-do farmer—every owner of a cozy village home—every member of a city stay-at-home club who commands a spot big enough to swing one—should have a hammock. A very good one may be bought for \$1.50 to \$4, or as much higher as you choose to go. It should be hung where there is a good afternoon shade, and, if intended for use for children's use, so low that small children can get into it by the aid of a box or low stool, and over soft ground, so that the numerous tumbles that are probable will be harmless. If no other place is available, it may be hung between the pillars of a veranda, a place well enough for the older people who use it, but undesirable for children on account of the lack of a soft turf, as well as for the noise which accompanies its use by the youngsters. When children only are to use the hammock the manner of hanging it is not important, but if provided for the use of grown persons it should then be so suspended that the head will always be considerably higher than the feet, and the use of the hammock of one who uses it depends upon a proper observance of this fact. If you have no more suitable place, suspend it from the columns of a veranda. The hook which supports the head end should be 4 feet from the floor, and that for the foot end 3 feet, and these proportions should be observed wherever it may be hung, to secure the most desirable curve for the ease of the occupant.

Another point to be observed: the head end should be fastened to the hook by a rope less than a foot long—just enough to properly attach it, while at the foot is a rope 4 feet long. This gives the greatest freedom for swinging the lower part of the body, while the head moves but little. This is a point which cannot be observed in a hammock for children, who think more of it as a swing than a place of comfortable repose. When trees serve for supports, ample provision should be made to prevent injury to the bark, by means of a stout canvas or heavy bagging between the ropes to which it is suspended and the bark. If the hanging be so arranged that the hammock can be taken in during long storms it will last much longer.—*Boston Golden Rule.*

A SURGEON'S EXTRAORDINARY LEAP.—Although it happened over half a century ago, the following story, vouched for by Mr. Chester Burbank, of Watervliet, an old resident of the town, will be found interesting even at this late date. In the year 1830 the sloop *Robert Burns*, of Castleton, was lying at anchor off the Palisades. The sloop was 200 tons burden, and was manned as follows: Captain, Arad Buckman; pilot, Wm. Porgy; cook, Chester Burbank, who now relates the story; and Henry Douglass, Tinsmith and one Bogie, of the crew. There were also two young ladies aboard, who occupied the cabin, one of whom was named Miss Almira Austin. About 12 o'clock at night the crew were roused by the shrieks of the young ladies and a terrible commotion in the cabin. The door was broken in, when it was found that a huge sturgeon was in the room, and the trouble. Appearances indicated that the fish had leaped from the river upon the locker and slid through the open window of the cabin, landing in the berth occupied by the young ladies. The young girls, unable to realize what the object was, were paralyzed with terror at first, but soon regaining their senses gave utterance to shrieks and loud springing from their berth, crouched in the furthest corner of the cabin, while the fish, finding himself in strange quarters, flopped about in the berth. It is needless to add that the surgeon was speedily dispatched by the sailors and divided equally among those on board. The young ladies, however, refused their shares, and could not be induced to even taste of the fish after it was cooked.—*Albany Journal.*

EQUALLY WONDERFUL.—Two patrons of the piscatorial art, having met at the water's edge, inquired of each other as to the success of the morning's fishing. It was found that the one had been fishing with fly and had made a tolerable basket, while the other, who had been fishing with bait, had taken only a very few. Referring to the state of the water, the fly-fisher recommended the other to give up the bait and try "fly," and he thought he would be more successful. His friend, saying he had no artificial flies with him, he was told he might catch a few natural flies and try these, and that the best for this purpose was the horse-fly, which he would get by the neighboring hedges. Taking this advice, he at once went off in the direction of the hedges. Seeing a girl herding cows, he went to her and said, "My good girl, do you know where it is likely I will get some horse-flies?" The girl, not understanding the question, looked at her interrogator, but made no reply. The question was repeated, but still the girl was silent. He then said to her, "My good girl, did you ever see a horse-fly?" "No," replied the girl, "but I've seen a cow jump over a dyk."—*Ayr (Scotland) Argus.*

MORE LATE EDITOR.—This time it is an English "society paper" editor who tries his hand at natural history. A London paper says:

One of these journals declares that the editor of another is the arch-fiend who was cast out of Heaven for misconduct—which we can scarcely believe. The arch-fiend responds by calling his assailant an egg-dealer, and says that he lays goose's eggs, a most remarkable fact in natural history. It appears to us, as mere outsiders, that the fiend carries too many guns for the egg man, and that the latter had better retire from the contest, or there may be a terrific smash, in which his fragile wares cannot fail to suffer severely. It is not pleasant, we admit, to be told that you lay eggs, and the eggs of a goose, moreover; but the best way is to keep the thing as quiet as possible.

VELOCEPÈDE TOURISTS.—Two velocipede riders of Paris, M. le Baron Emanuel de Graffenried and Burgenstein and M. A. Laumelle d'Angers, have accomplished a very long and rapid journey on their velocipedes. Leaving Paris on March 16, they returned on the 24th of April, after having traveled a distance of more than three thousand miles. Their route extended through a part of the west, the middle, and the south of France, Italy and southern Switzerland. They traveled through Orleans, Tours, Poitiers, Angoulême, Bordeaux, Montauban, Toulouse, Montpellier, Marseilles, Toulon, Nice, Menton, San Remo, Genoa, Turin, Milan, the Simplon—where they barely escaped destruction by an avalanche—Vevey, Bern, Lausanne, Geneva, Dijon, Troy and Provins. The longest distance that they accomplished in a single day was between Turin and Milan, a distance of 90 miles which they made in 9½ hours.

TEACHING BULFINCHES TO SING.—At Fulda, in Germany, there are several schools for teaching bulfinches to sing. The young birds are divided into classes of from six to ten each, and kept in the dark. As they are fed a small hand organ is played. The birds first begin to associate the music with the feeding, and when hungry they begin to sing a few notes of the tune they hear daily. They are then placed in a room where light is admitted. This seems to render them more lively. They are then taught additional music, and enjoy singing. The most difficult task is starting the birds. Some are kept for a long time in the dark, and on starvation tactics before their stupidity or obstinacy can be overcome.

THE BICYCLE IN SCOTLAND.—The Scotch press reports that Mr. John Rankin, a young Kilmarnock gentleman, has just completed a journey to London and back on a bicycle. He left Kilmarnock on the 23d of July, and reached the metropolis on the 1st of August, after having made a stay at Sheffield, part of a day at Birmingham, and part of a day at Coventry. The distance of 430 miles was thus run in about six days, making allowance for stoppages. Mr. Rankin left London for home on the 6th of August, taking the east coast route, and reached Glasgow on Saturday evening, thence going to Kilmarnock that night by train. The longest run in one day was from Morpeth to Edinburgh, the distance being 112 miles.

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their **TIMING WATCHES** are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & CO.,** of Geneva, of whose celebrated watches they have a full line. Their stock of **Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware** for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase.

UNION SQUARE, NEW YORK

The Great European Novelty HUNYADI JANOS. The Best Natural Aperturer.

THE LANCET.—
"Hunyadi Janos, Baron Lieke, attests that its richness in aperient salts passes that of all other known waters."

THE BRITISH MEDICAL JOURNAL.—
"Hunyadi Janos is the most agreeable, safest, and most efficacious aperient water."

PROF. SOR VINCOW, Berlin. "Invariably good and prompt success; most valuable."
PROF. SOR BAMBERGER, Vienna. "I have prescribed these Waters with remarkable success."
PROF. SOR SCANZONI, Wurzbourg. "I prescribe none but this."
PROF. SOR LAUDER BRUNTON, M.D., F.R.S., London. "More pleasant than its rivals, and surpasses them in efficacy."
PROF. SOR ATKIN, M.D., F.R.S., Royal Military Hospital, Netley. "Preferred to Pulina and Friedrichshall."

CITY AND COUNTRY PROPERTY bought, sold and exchanged. C. S. PECK, 3 West Twenty-ninth street, New York. sept 11

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot-gun can be converted into almost accurate rifle. The AUXILIARY BARREL will fit any standard make of gun of 10 or 12-calibre—calibre of rifle 32, 38, or 44 as desired. Length of barrel, twenty inches. The shells used with the best advantage are the Winchester Repeating Arms Co.'s cartridges, No. 32 and 38, extra long, and No. 44, model 1878. Send for Circular and Price List.

Gunpowder.

THE
HAZARD POWDER CO
MANUFACTURERS OF
GUNPOWDER.

Hazard's "Electric Powder."
Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."
Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."
Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters and 6½ and 1½ lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it runs any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."
Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. kegs of 25, 13½ and 6½ lbs. and cans of 1 lb. FFG is also packed in 1 and 5 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FFG is the standard FFG powder of the country.

Superior Mining and Blasting Powder.
GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

[Volume 11.—No. 6.
[No. 111 Fulton St., N. Y.]

THE LAMENT OF A MENAGERIE KEEPER'S WIFE.

I am tired of his passion for hateful beasts,
Around them he never will cease to roam;
And he gives them each night most delicious feasts,
While he knows I've nothing to eat at home.

He has often deserted me in my race,
My sad supplications regarding not,
As he hurried away to some horrid cage
To play with his lurid-eyed ocelot.

He has told me that never was mind of south
So sweet to the nostrils of wild or man,
As the breath of his brown-speckled jaguar's mouth,
Or the plaintive sighs of his pelican.

And all this I believed, but I cannot see
How he can prefer in this mania new,
To the kiss of his children, and love for me,
The embrace of a crazy kangaroo.

Yet mid tigers and lions he ever prowls,
For the sacred ox he has made a bed,
And he fondles the plumes of those awful owls,
That will hoot on my grave when I am dead.

And I who adore him am cast aside,
As if unworthy to be caressed,
While he slumbers with gladness and dreams with joy
On the clover-fed zebra's odorous breast.

Oh! some night could I only in silence steal,
Unsuspected behind him, I then might hear
All his elegant badinage with the seal,
And his honeyed words to the Lapland deer.

I would then hear him joke with the bats and bears,
And I know the sagacious things would laugh;
And I'm certain he'd speak of our household cares
To the puma's cubs and that old giraffe.

What hours he spends with the wombats too,
He seems of the yak cage to have a lease,
And I'm morally sure that the bristled gnu
Is his chosen love and last caress!

—CUTIE JONES in New York Sun.

For Forest and Stream and Rod and Gun.

Fishing on Lake Superior.

No. 2.

This is the forest primeval. The murmuring pines and the hemlocks,
Dearly with mosses and in garments green, indistinct in the twilight,
Stand like Druids of old, with voices sad and prophetic—
Stand like harpers hoar, with beards that rest on their bosoms.

—Ravenshoe.

THE shore along the south coast of Lake Superior, like that of Lakes Erie and Huron, is low and uninteresting; but as we ascend along the north coast the outline of shore becomes much more bold and picturesque, and in the vicinity of Thunder Bay and Niipegon, attains to the sublime. The far-famed picture rocks were disappointing in their effect, but Thunder Cape and the massive cliffs and palisades about the mouth of Niipegon River were extremely imposing and majestic.

We reached Red Rock, the post of the Hudson Bay Company, on the Niipegon River, some six miles above its mouth, on Friday, July 26. The only white persons residing here are the agent of the company, Mr. McLaren and his family, consisting of a son and two daughters. Numerous Indians and half breeds, ragged and dirty, lounged about the wharf as we came to a landing, while the wigwags, surrounded by a squalid and dirty set, told us in unmistakable language that we had at last reached the land of Hiawatha. Wherever we had heretofore landed and been disappointed in the fishing, we had been encouraged by being told "to wait till we got to Niipegon." So now we were at "Niipegon," the deep, clear water, as the Indian name signifies, and what was to be the fruition of all our hopes? Were we to have them realized to the fullest extent? or were we to be again disappointed?

No sooner had the steamer reached her landing than we sprang ashore, eager to try the trout that evening, although then nearly five o'clock. In vain, however, was our appeal to every Indian and half breed we encountered as to the quality of the fishing and the feasibility of procuring a boat and guide. None of them understood English, and it was only after seeing the agent and making our wants known to him that we were provided with a canoe, and a guide in the person of a sachem, known as Pierre, but called Peter for short. By this time a drenching rain had set in, but consider-

ing that rather favorable than otherwise, we donned our gum coats and hats and set out under the guidance of Pierre for the rapids, about half a mile above. The rain was pouring down in torrents when we reached the rapids, but the fish seemed to enjoy it, and were jumping in every direction. Steadying our boat in the rapid current by the use of his pole, as only an Indian can do, just at a point where a smaller stream, setting off from the main river, dashed wildly and swiftly over the rocky bottom, we began our casting. The fish rose eagerly and took the feathery deception in a way that showed they meant business, and the Indian lad who occupied the bow of the boat was busy landing and unhooking the fish. They were not of the largest size, but varied from about half a pound to two pounds in weight, and were exceedingly beautiful in their coloring and active and game as they struggled in the rapid current to effect their escape. In about an hour and a half we returned to the steamer with between twenty-five and thirty fish that were the admiration of all who saw them, and wonderfully stimulated the piscatorial zeal of all who had come in any manner prepared to fish.

The next morning was cloudy and lowering when I arose about five o'clock to see what preparations were being made for a camping excursion to the second rapids, some twelve miles up the river, at a point known as Camp Alexander. As all was quiet on the steamer, and likely to continue so for an hour or more, I hastened ashore, and having rushed up Pierre, set out for the scene of our previous evening's sport. The fish, though not so abundant as on the previous evening, were still quite plentiful, and in about an hour I returned to breakfast with a half dozen fish, averaging three-quarters of a pound each.

I shall always recall with pleasure the few hours' fishing at Red Rock. While the fish are neither so large nor plentiful as they are further up the river, yet they are abundant enough and of a size sufficient to make it royal sport, while at the same time it is free from the annoyances and excessive labor of attending the fishing higher up. The fishing ground can be reached in fifteen or twenty minutes from the steamer landing. The water is beautiful, swift, clear and cool. You are to a great extent free from the attacks of the black-flies and mosquitoes which are so annoying in the woods, and all you have to do is to submit your boat to the guidance of your Indian and devote yourself to the tranquil enjoyment of your surroundings, all the while taking fish enough, if you understand your business and are properly equipped, to satisfy any reasonable desire.

On arriving at the steamer we found arrangements in progress for the camping excursion, and about nine o'clock some dozen of us, together with as many Indians in charge of the boats, set off for the camp, being accompanied across the portage of a half mile by pretty much the entire excursion party from the steamer, and took our departure amid the waving of handkerchiefs and cheers of encouragement. Our party were the most of them prepared for fishing of some kind—that is to say, they had rods and lines and hooks, but as they had no previous experience in trout fishing, their equipment was better adapted for ordinary still-fishing for bass or pickerel than for casting a fly for trout. Several of our number, however, went as spectators merely, and to enjoy the novelty of a day and night in the woods.

It is a long and tedious pull from Red Rock to Camp Alexander, the current of the river being at some places so strong as to make it extremely difficult to pull up, and it was late in the evening when we reached our camp. Too late, indeed, to do much that day, and a most wearisome walk of three or four miles was rewarded by the capture of only eight small fish. One Indian, however, took about the same number with his bait, and other members of the party having met with like success, led us among us the greatest abundance for supper and breakfast.

The most of us had taken the precaution to purloin from the steamer the blankets in our respective state rooms, and one or two of us had availed ourselves of the opportunity to buy in addition a heavy blanket from the agent of the post. It was well we did, as during the night the mercury fell to forty-two, and it was highly amusing as I lay awake about three o'clock in the morning to hear the maledictions from our neighboring tent on the weather. In a little while one of its occupants crawled out exclaiming: "My God! I'm frozen," and soon another and then another, until all the company, with two or three exceptions, had grouped themselves around the camp fire, where, with the abundance of dead pine timber, they soon had the woods aglow with the roaring flames, and were themselves thawed into condition to face over their grievances.

The next day was Sunday, and perhaps the least said about the fishing the better. Several of our party, however, started out early and returned about noon highly elated with their success, and bringing in with them between forty and fifty fine fish, the largest weighing four and a half pounds. This was taken with a troll by Mr. Crane, of Detroit.

The writer's own experience of Sunday fishing is by no means satisfactory. Having remained in camp with a few others, whose consciences did not altogether approve of Sunday fishing, and the hours becoming exceedingly monotonous and heavy, he, in an evil hour, suggested to a friend, who was under bonds to his wife not to fish on Sunday, that they should walk down to the river at a point only a hundred yards distant and relieve the tedium by making a cast or two, to which proposition said friend agreed, but as he was under

bonds not to fish, kindly consented to carry a landing net. But ours, alas, was but a short and inglorious excursion; for, after a break neck scramble through fallen pine trees and underbrush, and a continuous warfare with the black flies, hardly had we reached the river when, in an endeavor by a long leap to reach a large rock slanting at an angle of about forty-five degrees, the writer's feet, as he struck the rock, flew from under him, and in an instant he found himself up to the arm-pits in the river. To grasp hold of the rock and scramble out and return to camp a wiser and a wetter man, and one disgusted with Sunday fishing, was all that remained to be done.

The experience of the previous night had satisfied most of our party, and on Sunday evening they all, except four or five, returned to the steamer. Early Monday morning we were stirring, and having had breakfast by six o'clock, started for the falls about two miles above the camp. After a portage of half a mile we took to the canoe and began the ascent of the rapid current. During the ascent to the second portage, a distance of perhaps a mile, our boat took a dozen or more fine fish, when we again disembarked, and, after a toilsome tramp of nearly a mile, came to the falls.

The scene that here burst upon us was terrifically grand. The immense volume of water came hissing and roaring down the cascade with perpendicular plunges here and there of ten or fifteen feet, and as it dashed furiously against the rocks below spouted high in the air and fell around in wreaths of spray. At the base of the fall is a long deep pool, through which the current sweeps rapidly till it reaches the lower end and meets the obstruction of the shallows, when it turns back with an eddy and sweeps up along the left bank on which we stood. I have not often seen a more splendid cascade and waterfall than these falls of the Niipegon River.

Our party were soon actively engaged, and a great many fish of one and two pounds weight were taken. I was fishing, as was also my comrade, with an eight-ounce split-bamboo rod made by Leonard, of Bangor, Maine, and the perfection of lightness and elasticity, and consequently had great advantages, especially in casting, over those using heavy tackle.

Having satisfied myself with fishing the more quiet portion of the pool, and in the hope of striking something heavier than we had yet taken, I approached nearer to the fall, and walking out on a projecting rock just at the foot of the cascade, where the roar was deafening, made a cast into the boiling foam below the fall. A splendid fish rose, and, seizing the fly, sunk again into the foaming waters below. The strain on the rod and line was tremendous until I succeeded in pulling him into the quieter water just below the projecting rocks on which I stood, and which I had succeeded in doing by the time my guide reached me with the landing net, and who was at the time toward the lower end of the pool. After giving him time to exhaust himself in the quiet water, he was safely secured in the net and found to weigh three pounds. A few moments after my comrade, a lad of sixteen, struck, and after some time succeeded in landing a fish of like weight. Having no landing net, the young gentleman was loud in his appeals for help, when a young friend of his own age gallantly dropped his own rod, and, seizing the first net he could lay hands on, hurried to his relief; sometimes falling over rocks, sometimes splashing knee deep in the water, and anon stopping a moment to disengage himself from bushes and snags, he at length came to the rescue and took out a three-pound fish.

Many fish were taken of two and two and a half pounds weight, but as we had to return to the steamer that night it became necessary that we should stop our fishing about noon in order to reach the camp and make our preparations for returning. On our arrival at the camp we found we had nearly a hundred fine trout, and were satisfied. We ate our dinner, packed our traps, and set out on our return down the river to the steamer, which we reached late in the evening, flying our mosquito nets and handkerchiefs as banners, and were enthusiastically received by our friends on board, mostly, no doubt, through good fellowship, but partly because they were extremely tired of waiting for us and were anxious to leave.

In conclusion, I would say that I have never seen any trout fishing equal to that on Niipegon River. In the Rangeley Lakes large fish are often taken, but from my own experience on Rangeley, I would say you take ten, nay, twenty, fish in Niipegon to one there. In Moosehead Lake more fish can be taken than on Rangeley, but the fishing, all considered, does not, in my judgment, compare with Niipegon. Even as regards the size of the fish, I have little doubt that if any record were kept, more fish of five pound and over would be found to be taken on the north shore of Lake Superior than anywhere else in the country. Louie, my Indian, stated that about a year ago he appeared, just at the head of the Red Rock in Niipegon creek trout that weighed sixteen pounds. I do not undertake to vouch for Louie's veracity, but at the same time see no great reason to doubt his truth.

Fish of eight and nine pounds are not uncommon in the lakes of Maine, and I believe there is a pretty well authenticated instance of one which weighed thirteen pounds. The jump from thirteen to sixteen is not very great, at least I am disposed to think so. It is not necessary, however, that the Niipegon fisherman need resort to the ordinary trout rod, reel and silk line, with a supply of gut leaders and flies, and an extra tip or two to provide against accidents. It is well, also, to be provided with some preparation of pennyroyal as a defense against insects. Heavy tackle would be of no special advantage except in enabling you to land the fish faster when biting rapidly, and the advantage in this respect

would be more than counterbalanced by the disadvantages attending its use, in the increased difficulty of casting and in other respects.

Of course all this applies only to fly fishing. If any one wishes to go all the way to Niageon and fish with a lead and bait, and yank out trout as you would catfish, no special precaution is necessary. Only do as the Indians do—cut the first stout sapling alongside your path, tie a stout piece of cord to the end of it, tie on half an ounce of lead, and take two or three half hitches over the shank of a stout hook, stick on a piece of fat bacon, and throw your bait with a chug into the river. When you feel a tug yank him out; if a small one you will probably find him suspended fifteen feet in the nearest pine tree from the hook in your hand. If you keep your temper. If a large one, and your hook tears loose, keep your temper; but, if you are fortunate enough to land him, thank your lucky stars and go on your way rejoicing. I have never been a believer in the entomological knowledge of trout, and my experience on Niageon did no tend to encourage such belief. So far as I could see, the trout accepted one fly as readily as another—and red or yellow, blue, gray or white, all were alike welcome.

The agent of the Hudson's Bay Co. issues fishing permits, for which he charges one dollar per day, or a season permit for five dollars. Some of our party were inclined to demur to this demand and question his right to enforce it. I cannot speak authoritatively on the subject, but have myself no doubt of his right to do so. Our steamer left Niageon on the morning of Tuesday, the 10th of July, and ran direct for the Sault, where we had a repetition of our former good luck fishing, and, having again ran down the rapids, we laid aside our tackle, satisfied that after Niageon all else would be stale, flat and unprofitable. PISCATOR.

Steamer Keceenaw, Aug. 2, 1878.

Fish Culture.

FISH NEWS FROM NEW HAMPSHIRE.

Mr. Sam. Webber, one of the New Hampshire Fish Commissioners, writes from Manchester, September 7:

The young salmon which were introduced in '76, were very plenty last year, and had not all gone to salt water last July. We have built a new damway at the Rockingham Falls in this city, with a very easy slope—about one foot in fifteen—so that any fish can ascend it easily. Salmon have been seen here at intervals all summer in the pools below the fall, and many of them have undoubtedly gone up. One, estimated at twenty pounds, a week ago—August 31—and Commissioner Powers has secured several at the hatchery above Plymouth. We expect to get more when the fall runs come to start them, as there was quite a large run in October last year. The mill owners at Nashua have just completed two first-class fishways on the Brackett plan, over the dams on the Nashua River in that city, which will give the salmon access to the upper waters of that river in Lancaster and Clinton, Mass., where the fry have been placed by the Massachusetts Commissioners. The road to the Pemigewasset River is all clear for the salmon, and next year we expect to provide fishways, so that the shad which we put in last summer can return to Lake Winnepesaukee. All the evidence we can collect points to a two-years residence of the parr and smolts in fresh water, after which they go to the sea, returning as 8-pound fish the fourth year. Most of those seen in 1877 weighed from 7 to 8 pounds, and must have been of the planting of 1875, as there were none put in the Merrimack in 1874, the fry of that year having all been planted in Connecticut. A few larger fish of last year may be referred to the planting of 1873. The same holds good this year, while the main run of those seen have been from 12 to 14 pounds, with a few larger ones. I, for one, have no faith in the theory that salmon increase in weight with such enormous rapidity in salt water, that a smolt of $\frac{1}{2}$ or $\frac{3}{4}$ of a pound can go down to salt water one season and return a 10-pound fish the next.

We have ordered from the S. Fish Commission 250,000 ova of the *Salmo gairdneri* not of California shad, as some of the papers have it which we hope to hatch successfully and divide between the Merrimack River and one of the larger lakes, wishing to see if they will naturalize in fresh water, as they have in California. We also expect from Mr. Stone some of the ova of the McDougl River trout, and have arranged with Mr. Stone to landlocked salmon spawn. Massachusetts will probably receive a lot of California ova, and we have 150 fine brook trout weighing from $\frac{1}{2}$ to 2 pounds each, so that we expect to fill our hatching boxes this winter with 600,000 ova of various species of the salmon family. If the Connecticut Legislature will pass proper close laws and allow the fish to return up the river of that name, we will put part of one hatch in the upper waters of that stream.

Black bass fishing has been very good this season in some of our ponds, while in others, either from want of food or some other cause unknown, most of the fish appear to have escaped and gone down into the rivers, but Sunapee Lake, Wakefield, Milton, and Northwood ponds have afforded fine fishing.

SETH GREEN ON EELS.

ROCHESTER, Sept. 4, 1878.

EDITOR FOREST AND STREAM: I see by the papers that some party has seen spawn in eels, and another party has seen young eels born. One or both of these parties are mistaken. I am going to let them fight it out, and it may be that some one will take up the fight and use up the controversy. I saw my name mentioned in all the articles, and I think it my duty to let the people know what I have said. I said I had opened thousands of eels, and I had opened and examined them nearly every day in the year, and had never found any young eels or spawn in them except in their stomachs. All I ever said was that I did not know how they bred. I may have said some time that they might be hybrids, but I never said they were; and the reason I did not say they were hybrids is because I did not know. If an eel had a row of spawn like other fish she would have a row after she had done spawning. The sac that contains the spawn is left, and in three weeks it is healed up and is as perfect as it was before the fish spawned. The sack after spawning is so small that people do not notice it. It is about one fiftieth part as large as it was before she cast her spawn. I fish carry these eggs for years. When they are put under a magnifying glass they can be seen of several different sizes. Those nearest to the cast out are the largest, then there are immature eggs, which

diminish inside. There may be as many as seven of these distinct formations. Some fish begin to breed when they are two, and some three and four and five years old. Now, suppose a fish is five years old and it breeds seven years, that would make it twelve years old. That would take it through the prime of its life, and fish may be like animals, and their breeding stops when they have passed the prime of their life. I have seen a deposit of eggs for days; fish have for years. Hens lay one egg a day and fish lay one batch of eggs per year. If eels spawn I do not think it would take long to find that out, for the roe sack is always there after the fish have spawned.

I have said that I thought they breed in the ocean, because I have always seen them coming up the fresh water streams when they were not larger than a small snail, and when they are that size they can go up any falls. They do not go up in the sheet of water, but on the rocks, the same as an angle worm would go up any wet surface, and I think that is the reason that there are no eels in the upper lakes. The reason is because they get so large by the time they arrive at Niagara Falls that their weight causes them to drop off. I believe if Niagara Falls were within one hundred miles of the ocean that young eels would go over them. I have never seen or heard of an eel being caught five hundred miles from the ocean that was not over six inches long and his body as large as a pipe stem. These facts are what I base my opinion on. I am anxious to know how eels breed, and will send the first man a draft on New York for five dollars, and pay express charges, that will send me an eel with young eels in it that bred there, or an eel that has a roe of spawn in it. Yours,

SETH GREEN.

Mr. Green's ideas about eels are very good and sound, and his explanation why eels are not found above the falls of Niagara is quite plausible.

—Eels in Michigan, thanks to the work of the Commissioners, are quite plentiful. In nearly every place where they have been deposited they have grown and multiplied.

THE LUDLOW THOUT CO.—This association is prepared to sell trout and salmon eggs and fry at reasonable prices. Address B. Freulburg, Supt., Ludlow, McKean Co., Pa.

Natural History.

AN EXTINCT ANIMAL.

EDITOR FOREST AND STREAM:

In the "New Annual Register" of 1781, there is an "Account of some particular animals in Connecticut," purporting to be taken from the "General History of Connecticut." Precisely when this "General History" was published, or what degree of credibility it was entitled to I am unable to say; but in this "account" is the following catalogue of animals which had their habitat in that State, which I transcribe in the words of the History:

"There are only two small parks of deer in Connecticut; but plenty of rabbits, hares, gray, black, striped and red squirrels, otters, minks, raccoons, weasels, foxes, whapenockers, woodchucks, cubas and skunks. The following descriptions of the four last mentioned animals may be new to the reader."

I shall, for want of space, omit the description of the woodchucks and skunks, as containing little that is novel, and shall pass over the account of the whapenocker with the simple remark that he was somewhat higher than a weasel, a beautiful brown color, exceedingly wild and unamiable, and carried a fur of so fine a quality that muffs made of it sold for forty guineas apiece; but the description of the cuba is so interesting that I transcribe the quaint original:

"The cuba I suppose to be peculiar to New England. The male is of the size of a large cat, has four long tusks sharp as a razor, is voracious and demands higher food, if he has the first blow will spoil a bed before he yields. His lady is peaceable and harmless, and depends for protection upon her spouse; and, as he has more courage than prudence, always attends him to moderate his temper. She sees danger and he fears it not. She chatters at him while he is preparing for battle; and, if she thinks the danger is too great, she runs to him and clings about his neck, screaming her extreme distress; his wrath abates by her service, but he does not love her in like manner, when he is chained, and irritated into the greatest rage by an impatient dog, his lady, who is never chained, will fly about his neck and kiss him, and in half a minute restore him to calmness.

"He is very tender of all his family, and never forsakes them till death dissolves their union. What father shows the magnanimity of his little animals! He never manifests the least anger toward his lady, her servants, his own or her children, in any manner, when he is chained, and irritated into the greatest rage by an impatient dog, his lady, who is never chained, will fly about his neck and kiss him, and in half a minute restore him to calmness.

"It is to be observed that the writer does not furnish any description of the color, appearance and personal habits of the cuba, by which we may compare him with other animals, or determine whether he is now really extinct, further than that he "is of the size of a large cat and has four long tusks sharp as a razor." I was tolerably familiar with the fauna of New England fifty years ago; but I think the cuba will have to be identified by somebody older than I am. I should suspect that the author of the "General History of Connecticut" had been made a victim of by some one accustomed to draw the long bow, but that he claims to have seen the animal he describes and to have himself witnessed the exhibition of those admirable moral qualities ascribed to the cuba.

There are said to be grains of truth in the sources of all the myths that invay human beliefs and current social systems, and I hope there are savants among your readers who, from the facilities of age and accurate observation, or of extended reading, may be able to identify, by the above description, the very curious New England animal whose example is held up for imitation by the "rational part of creation."

Milwaukee, Aug., 1, 1878.

Geo. W. Chapman.

MULE DEER.

EDITOR FOREST AND STREAM:

I notice in your issue of the 29th of August that a hunter expresses his regret that he did not "kill" in the Rocky Mountains against the liberty Eastern naturalists have taken in re-

christening, as he supposes, *C. macrotis*, calling it the mule deer instead of the black-tailed deer, the name by which it is known in that region. A little attention to the history of this nomenclature will show the hunter that the rechristening was done in the mountains, when it was called black-tailed deer. This deer, so far as we have any written record, was first discovered by Lewis and Clark in 1804. They first called it the black-tailed deer, and then the mule deer. In 1805, when they abandoned this name for *macrotis*, and gave it the name of mule deer, giving the former name to the Columbia deer, and they thereafter adhered to the name of mule deer except in one solitary instance. When on their return in 1806 they procured their last specimen, which they brought home, they called it the mule deer, which is the last time the mentioned name was given to the animal. According to every rule of propriety and practice, then, as the first discoverers had the right to name it, especially if they proposed an appropriate name. The enormous ears of the animal suggested the name and vindicate its propriety, while there is a manifest impropriety in calling it black-tailed deer, when the entire tail is white except the black pencil at the end—a much larger proportion of the tail is white than black. On the black-tailed deer, as the visible part of the tail is black, and hence the appropriateness of that name for it. The Columbia deer has never been known by any other name. I submit, then, that the hunters of the Rocky Mountains did not act wisely when they rechristened this deer, giving it an inappropriate name, and one which properly belonged to another and very distinct species. From necessity this new name could have been given to the animal, for the hunters of the Rocky Mountains these deer occupy the same range, it must be known by its old name to avoid unutterable confusion. It seems to me that the hunters of the Rocky Mountains should desire to be able to converse intelligibly with their brethren on the western slope on this subject; but this is impossible so long as they retain this misnomer. Audubon and Bachman, Prof. Baird and all other authorities, so far as I know, have followed the names given to these deer by the hunters of the Rocky Mountains, and in doing this it never occurred to them that they were rechristening this Rocky Mountain deer. The question of names I deem an important one, if language is to be used to convey an identical idea in all parts of the country. Already great confusion and misunderstanding has arisen from this misnomer, and I really think the sooner it is abandoned the better.

J. D. CATOON.

Ottawa, Ill., Sept. 4.

AT THE AQUARIUM.—It is kind of comforting to look at an alligator nursery, a whole batch of the darlings little "igators you can clasp your eyes on," "prayer enough," a strong-minded lady who looked at them said, "to kiss a crocodile is to kiss your foster mother. The Doctor imported a bed for the eggs, brought up the temperature with horse manure, watered them, and in eleven weeks the little things chirped the shell. Of thirty-six eggs thirty-five alligators were born. One egg was cut open to see how the incubating performance was getting along. Now the secret. Dr. Dozier may claim as his own the use of the watering pot to sprout the eggs, and keep the eggs moist. One of the little things when handled showed exceeding obstinacy. He would not open his mouth to show his teeth. When forced to do so he gave faint squeals which could be distinctly heard. Little alligators are very much in request for aquaria, and as now the whole rationale of raising them has been found out, the eggs can be entered into the market for a considerable demand. A saunter through the aquarium discloses many new features. The electric eels look in fine condition. Their specimens are quite as large as the tank, and seem so comfortable and contented that there can be no doubt but that they are storing up all the time whole loads of electricity. For eels they are quite handsome, the bottom of the head and neck being of rich salmon color, the sides of the head being black. The eels are to be let into one of the ponds in the aquarium with a Bleeker street car horse has not yet been arranged as to time. Dr. Kohn is busy educating his two pets, Saets and Bobita, the hippopotami. These two brutes, solid 400 pounds of India-rubber, are in splendid condition. The fine order they are in arises from the egg-nog (less the liquor in it) which they absorb every morning. Their breakfast being 10 eggs and a cup of water, for each of the two brutes. When the word of command the hippo's smile. It is a smile covering about an area of four square feet, when the grooving tusches and any amount of tongue and jaw can be seen. The Doctor says they are fast becoming gentle, though they will snap like a bulldog at times. It is doubtful whether they are very sensible animals. All their heads seem devoted to seeing, hearing, eating and drinking out of the water, their brains being so small they are bound to be small. The peculiar valves in the nostrils are curiously constructed. As soon as apples are ripe the young hippos will be fed with some as a desert after their mash of bread and bran. Should a baby hippo get a colic what a sad thing it would be, and what gallons of paregoric would have to be poured down! The two chimpanzees seem to be all right, but, poor creatures, the water is coming, and it is doubtful whether they will live. The most melancholy of them we know of is to see a languid chimpanzee munching a cold boiled potato. One especially, the red-haired monkey, is said to be a striking likeness of Kearney, though it is the seal which "pools its issues." The grand coming feature of the aquarium is the advent of Professor Hermann, the great predigestor, who will do all kinds of impossible things. This wizard will commence to astonish people on the 18th of this month.

YOUNG OF THE STING RAY.—Sarasota Bay, Fla., Aug. 19,

1878.—Editor Forest and Stream: I notice in recent numbers several items relating to the development of the young of the sting-ray, *Trygon centrurus*, or, in the vernacular, sting-ray. I am happy to be able to give a little information on the subject, and to show that the young of the sting-ray are not as one of your correspondents states that he had only found them in the spring, although the fishermen stated they were also found in the fall. I was at Cedar Keys the 21st of last month, and while my sloop was lying at the wharf a number of men and boys came down to enjoy the fishing on the incoming tide. Among the catch was a sting-ray, some eighteen or twenty inches across, which after being weighed and measured was thrown to three live young, about one-third as broad as the old one. As soon as this fact was reported to me I hastened up the wharf intending to secure the family for the Smithsonian or U. S. Museum, but was unfortunately too late, as the young man and brother who caught them, in revenge for a slight sting from the old one, had mutilated every one so thoroughly that I doubted if they could be made of any use for scientific purposes. The young of the sting-ray are very lively and doped about as much as the old one, and as far as I could observe they were as completely developed. Upon

his point I would state further that while beamed just back from Long Boat Inlet several years ago, and as near as I can remember it must have been in August or September, I drove my lily-iron completely through a sting ray, which must have been at least four feet across the wings or back. The harpoon toggled on the under side, so there was no chance for it to draw, and the fish was so powerful that it drew my boat quite lively for several minutes, when, with the help of the throat balliards, I hoisted it on deck. Just before it was fairly balanced on the rail, three young ones, some six or eight inches across, escaped from the vent, fell into the water and fluttered away as lively as though they had been there before. I cut the large one open to secure the liver for oil, but did not discover any more young.

MAJOR SARASOTA.

DO FISH FEAR?—Mr. Editor: One day last summer I went snapper fishing, and while waiting for a bite watched the thousands of young menhaden playing around my boat. Suddenly there came the report of a gun, discharged in the woods, at least a mile distant. At once every fish disappeared. This occurred several times, and if the little "Jersey Sardines" did not hear the gun, what made them dive? While on this subject, I will add that having read in "Domesticated Trout" that the speckled gentlemen and ladies refused to eat during the spawning time, to test the matter I took spawn from a trout, placed her in the water, then threw some of her own eggs in front of her nose, and she at once swallowed them.

THOMAS CLAPHAM.

Roslyn, I., Sept. 1.

A THREE-LEGGED WOODCOCK.—Mr. Sutherland has called our attention to a three-legged woodcock which turned up among a lot of birds. Unfortunately the careless cock, who was not on the look out for *una natura*, had the plumes off of *phibolea*. The third leg was independent of the two natural appendages, had toes and claws, but was evidently more for ornament than for use. Now, if nature wants to play freaks of this character, why don't she construct a woodcock with two heads, or make a canvas back duck with a supplementary breast?

THE SPEARING ANCHOVY.—This little fish, so plentiful on our shores, and so often used for bait, Professor Goode and Dr. Tarleton Bean declare to be a species of anchovy, *Engraulis vitellatus*, and differs but slightly from the *E. encrasiolus*, the European variety. The very long name the little European fish has is a translation of gall-tinctured, because of some peculiar bitterness in a badly cleansed fish. Spearing have become somewhat notorious of late in our waters, as they have been sold for white bait, which latter fish they do not at all resemble.

AN ENGLISH RAVEN ON THE WAR PATH.—*Danville Junction, Me., Aug. 29.*—Mr. Editor: I brought a fine raven from Sheffield, England, four years ago, and he has just commenced to talk this summer, speaking the words *Rosie, Sophy, Warren*, names in my family, and saying, "How are ye?" quite plainly, and very loud and distinct, but he is a savage "brat," and don't turn out for anything, having killed a pair of ruffed grouse, a bittern, and a beaver for me.

M. W. C.

ARRIVALS AT THE CINCINNATI ZOOLOGICAL GARDEN UP TO SEPT. 1 1878.—One *Lama*, *Lama peruviana*, born in garden; one chimpanzee, *Trigloides* myr, deposited by Messrs. C. Kelch & Bro., one alligator, *A. mississippiensis*, presented by E. J. Higgins; one macaque monkey, *Macacus cynomolgus*, born in garden; three passenger pigeons, *Ectopistes migratorius*, hatched in garden; one canary, *Serinus canarius*, presented by Dr. Zipperling; two silver pheasants, *Bucconius nethermeris*, hatched in garden; four English pheasants, *Phasianus colchicus*, hatched in garden; two hog deer, *Cervus porcinus*; one Equine deer, *Odocoileus*; two spotted deer, *Odocoileus*; one spotted deer, by A. Eckenbrecher; two olive weavers, *Hyphantornis capensis*, hatched in garden; one great egret, *Ardea egretta*, purchased; two ditto, presented; two giraffes, *Camelopardalis girafa*; two jaguars, *Felis onca*; two weeper capuchins, *Cebus capucinus*; two brown capuchins, *Cebus fatiulus*; two white-throated capuchins, *Cebus hypoleucus*; one great kangaroo, *Macropus galeatus*; two Stanley cranes, *Tetrapterys paradisa*; one King vulture, *Gypsalus papa*; one blue and yellow macaw, *Arara aranna*, purchased. H. P. INGALLS, Sept.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN, FAIRMOUNT PARK, FOR TWO WEEKS, AUGUST 27.—One pine snake, *Platygonus melanoleucus*, presented; one woodchuck, *A. monax*, presented; one Am. robin, *Turdus migratorius*, do.; one snake, *Coluber vulpina*, do.; one kangaroo rat, *Hypsiglynnus rufescens*, born in garden; one great horned owl, *Bubo virginianus*, presented.

The Kennel.

HOW POYNINGS SOLD HIS DOGS.

EDITOR FOREST AND STREAM:

Will you allow me to tell an apparently simple yet complex story? I was the owner of a small kennel, some five pointers and setters, with a half dozen youngsters. With time and means at my disposal I had carefully selected my stock. All my dogs had been exhibited, and had secured a fair amount of prizes. I had taken great pride in my kennel, when questions of health required my seeking a milder climate. I beg to state this fact quite distinctly as the sole reason for my wanting to sell my dogs. I advertised my dogs in the *FOREST AND STREAM* AND *ROD AND GUN*. My stock must have had a fair reputation, or your paper must reach all over the country, for one week after the insertion of my advertisement letters came pouring on me like a deluge. My prices, which had been fully announced, I had determined not to abate a penny. First I may remark that many letters I received intimated that the figures I had fixed "were very well for an asking price, but what was the money I really did intend to take for them dogs?" Occasionally a letter would come in which I was soundly berated for asking such an insignificant sum for my

choicest dogs, the tone of these epistles indicating that I was a bear in the dog market, and vowing vengeance on me for my intention to break down the business. Need I remark that the general spelling and get up of the majority of the letters were of the worst kind? Sometimes my correspondents would abuse me. I was told that my dogs were not worth a cent, that the prizes I had won were due to favoritism. That on the occasion of such and such a show I must have remembered "that a dog, the second to the left from your (my) poor many brute, which was nothing but a scrub, was a handsome dog, and, as money and not brag was the thing, that he (A. B.) would bet his dog or dogs against mine, to take them in the field and try them, and if my (A. B.'s) wasn't the better, why (I) might take his dog. If I wanted to," this individual continued, "put up money, there was a crowd as would back him to the amount of \$1,000. I had only to send my dogs to him, and I might expect on their having a fair showing." One very impudent person intimated to me that there was a ring which would prevent my selling my dogs unless through his intermediation. "Just clap on \$100 on your price and give me \$50 for commission, and I can sell them. Send me \$5 at once for expenses I may be at." I might have sent a photographic establishment, and would not then have been compelled to keep up the demand for dog pictures. As to the offers to swap, they were of the most varied kind. One whole-souled gentleman offered me one-tenth share in an oyster smack sailing out of New York, another a whole arsenal of second-hand fowling pieces, with a revolver thrown in; a real estate owner offered a quarter section in Texas. The barter of my good dogs for worthless ones was apparently a determined point on the part of many of my correspondents. Pedigrees of dogs, which were issues of lies from beginning to end, were sent to me. Of course, as I did not want dogs, good or bad, for such letters I had a ready reply. I am shocked to state that more than one attempt was made by persons who called themselves gentlemen to induce the man who had charge of my dogs to allow my stud animals to serve without my consent or knowledge. I never could have imagined that so many annoyances could have arisen from the simple desire on my part to sell my dogs. Some persons who would offer me half of what I asked, and which I politely declined, left my presence in great anger and spread the rumor that I had failed and that I was forced to sell out all I had, even to my watch and chain. As impudent an offer as I had was from one individual, who, after writing me six scrawls and coming to see the dogs a dozen times, at last made me the following proposition: "Ten dollars each, ten dollars at the end of the week, and the rest in notes at three and six months." One constant offer was for a party to take my best dog and to pay me half of what he would win for the next two years in bench shows, and one puppy from every litter of his get. Long letters of eight and ten pages, with a single postage stamp on them, when two and three were requisite, would come in every day. I had some idea of securing a security of this kind on my part to sell my dogs. I came across my man. In ten minutes my price was accepted, the money was paid, and I really was so pleased that I had not come in contact with a dickerer, or a suspicious man, or a party that wanted to overreach me, and was so satisfied that my favorites would be in good hands, that, in the exuberance of my heart, I presented that gentleman with a choice puppy. With my young dog in his grasp he was about to leave. The money was quite four months old, but singularly healthy and likely puppies. Everybody seemed to want them in their peculiar way. "Would I take — dollars for them, and deliver them in six months or in eight months?" The price mentioned was below my figures, and I was to guarantee that the dogs would be alive in some months to come. Attempts to overreach me, if possible, were made. Ten dollars each, ten dollars to be paid by unknown persons, to send at once to some depot out-of-the-way station in New Jersey a brace of my pups, the worst likely, and by return mail a post office order would reach me. One most annoying character was a woman—possibly the dog sisterhood—who offered me for my pup a parrot and ten free tickets to the leading theatres in New York for her coming season, the opera included. I think if a man had not received the worst of my dogs, I would have taken away one of the little dogs under her shawl. At last Baltimore, Philadelphia and Albany took my puppies at exactly my figures, and after one month of really hard work, over which I have had many a laugh, my dog mart is closed. I do not wish, however, to have such another experience.

New York, July 30, 1878.

POYNINGS.

DOGS AND THE CUSTOMS.—One would suppose by this time that the Custom house people understood their business, and that the question of duties on animals imported for breeding had been definitely settled. Last week Mr. William Astor had sent over a couple of blood hounds by the steamer *St. Laurent*, which took two whole days before they could be cleared. After the not very comfortable durance dogs get to on a steamer, owners are often very anxious to get their dogs on land. Such delays are then very stupid and uncalled for. In fact our American method of collecting duties is of the most unsatisfactory character. Bound up and twisted in red tape, difficult to understand, it is mostly out of the power for a person unacquainted with the routine of the office to clear his goods. All U. S. Customs House ordinance are impossible and onerous, when it becomes absolutely necessary that a new party, a Custom House broker, must be employed to carry out the simplest business with the office.

"SPICE."—*Editor Forest and Stream:* In your paper of September 5 I read with pleasure, mixed with sorrow, a letter from "Podgers" who was berated for his prices for the "with me and I am with him in his sorrow at the death of poor little Prince. I lost, many years ago, before war, a black and tan terrier bitch that I had raised from a puppy. She was digging after rats one night, and a heavy sill which she had undermined fell on her. We found her early in the morning under the sill, and took her out. There was no bone broken that we could find, but she pined away and died in a few weeks. "Podgers" has a story about Little Prince, that he took to the times when I would put and talk to Spies and the poor thing would wag her stump of a tail and thank me for my sympathy. She did not seem to suffer much and could walk a little, but nothing could be done to save her life. When I shall be at home again I know that my friends, Don and Punch, will be quite happy, which they are not now; for my servant, who has charge of them, writes that "don't look happy at all. With a hearty shake of the head for friend "Podgers." I am yours, etc., G. L. A.

Newport, R. I., Sept. 9, 1878.

ST. PAUL BARN SHOW.—An unaccountable delay in the mail has obliged us to defer the account of this exhibition until next week.

DOG ITEMS IN AND AROUND DETROIT.—*Detroit, Sept. 7.*—Mrs. General Custer has presented to C. E. Mason, of this city, the brace of imported Scotch staghounds, Swift and Tuck, given to the late General Custer by a Scotch poleman. These dogs gave chase to a deer of Mr. Mason's at his country seat one day last week. Mr. Mason's setter bitch whelped 8 puppies a few weeks ago. They are by Jos. Cook's Prince Rob, who is out of N. Dodge's field trial setter bitch Rose, by Filikington's Rufus. Prince Rob being imported in *utero*. This dog was short lived, having escaped from his owner's premises and running wild was cornered in the basement of a church, and parties reporting the dog rabid, he was shot by a policeman. He is a great loss to Mr. Cook, being thoroughly broken and a dog of great promise. J. B. Price, of this city, has presented one each to A. J. Rogers and S. F. Whitman, of this city, very fine pointer bitches out of his imported pointer bitch Fannie, by E. H. Gillman's lemon and white pointer dog Dash. Chase & E. H. Gillman, of this city, has sold the black and tan beagle bitch whelp Juno to Wensell Jack, Watertown, Wis.

DURIN.

IMPORTED IRISH FOX HOUNDS.—*St. Dennis, Md., Sept. 6.*—*Editor Forest and Stream:* The three couples of Irish fox hounds sent as a present to the Elkridge Fox Hunting Club, from the kennel of Mr. Moore, Ireland, arrived here to-day, just having come from the steamer *Caspian*, of the Allan line. They were in fine condition, and are large, well built, muscular dogs, and scars go to show that some of them are not unacquainted with foxes. They were taken to the kennel of the club on the 5th. I annex their names and pedigrees: Barbara—Black and white bitch, by Lord Portsmouth's Bondeman out of his Frantic (ears rounded). Racer—White dog with brown and tan spots, by Mr. Watson's Sinner out of Lord Donerater's Rosary (ears rounded). Frailty—White bitch with brown spots, by Lord Watford's Parnon out of his Tablille (ears rounded). Prosper—Black and white dog, by Lord Watford's Nestor out of Blankney Primrose. Vigilant—Tan and white dog, by Blankney Vanquisher out of Lord Watford's Giddy. Relish—Tan bitch, by Lord Portsmouth's Ranger out of his Remedy. The ears of Prophet, Relish and Vigilant are not rounded.

NASHVILLE FIELD TRIALS.—Our Nashville, Tenn., correspondent writes us that Mr. Clark Pritchell, Secretary of the Tennessee Sportsmen's Association, has begun work on the necessary preparations for the field trials to take place there in December, and the association are determined to make them as much of a success as they have formerly been.

NOT A GOOD JOKE.—At a recent breakfast, given by the Irish Zoological Society, some one who had a collection of animals in charge related the following as a good joke: Being in straits for money, he had crossed a fine breed of Australian dingoes with Labrador water-dogs, and advertised splendid watch-dog pups for sale. He sold them off at two guineas a piece until his funds were again replenished. All went well while the dogs were pups, but when the brutes grew up the wild strain of the sheep-killing blood burst out, and accounts appeared in the newspapers of strange, wild-looking animals in Clare, Mayo and Roscommon slaughtering sheep. There was a gentleman in the room who knew a farmer, twelve of whose sheep had been killed by one of these valuable watch-dogs. He said that, from a moral point of view, he ought to resign the post of secretary of the society, and had consulted a clerical friend on the matter. The latter informed him that the case was a difficult one, not provided for in the books. He thought, if the doctor's health allowed it, he might keep the place some time longer, but advised him, as a friend, to retire from it some time before death, to give time for repentance.

DOGS AT A BARGAIN.—An opportunity to secure a canine prize and to rescue a deserving dog from ignoble death is now offered to those interested. In the dog pound, foot of East Sixteenth street, this city, are a number of good dogs of various breeds, which are for sale cheap. If not disposed of in a short time they will be drowned with the curs in the East River.

PENNYROYAL FOR FLEAS.—A correspondent suggests that dog owners should gather a supply of pennyroyal, *Hedeoma pulegioides*, before the frosts kill it. It is very useful as a remedy for fleas, and may be used as a bed in the kennel.

DEATH.—Mr. W. Moore, of Bloomfield, N. J., has lost his black white and tan dog pup Magregor by champion Rob Roy-Bess.

DASH.—Some errors having inadvertently been printed as to Mr. T. A. Fowler's Dash, we hasten to correct the same. Dash was winner of first prize in Boston and of second prize in class 12, champion pointers over 50 lbs., in New York show. The dog was bought, not for Mr. John Gibb, but for John Gill, of the firm of J. and G. H. Gill, of Orange.

NAMES CLAIMED.—L. F. Whitman, Esq., of Detroit, Sept. 8, claims the name of Dandy for his white and white pointer bitch pup, out of J. B. Price's imported bitch Fannie, by E. H. Gillman's Dash.

CENTY.—Mr. Geo. Miller, of Jersey City, claims the name of Clytie for his liver and white cocker spaniel gyp, whelped May 13, 1878, out of F. N. Hall's Lou by Geo. Watson's Shit, winner of first at N. Y. 1878.

—Mr. E. D. Moss claims the name of Dandy for his cocker spaniel puppy, bred by Mr. McKoon, of Franklin, N. Y. Puppy out of Dasy by Sam.

GOLD MEDALS IN PARIS.—To Louis McMurtry & Co., of Baltimore, Md., canned provisions. Burnham & Morrill, Portland, Maine, for canned provisions.

Dachling and Boating.

NOVA SCOTIA YACHT SQUADRON.

TWO very good races were sailed by the yachts of the squadron on Saturday, August 24, at Halifax, a nice S. W. breeze springing up shortly after 1 o'clock. There were two entries for this race, the *Seafarm*, 26 tons, Captain Lacom, R. A., and the *Albatross*, 17 tons, Mr. D. Cronan. Both yachts carried main-gaff-topsails, but the *Seafarm*'s did not stand, and she had to head it, trusting to her mainmast stay instead. The second gun gave the signal to start, when *Albatross* stood by the line, crossing it at 11.14m. *Seafarm* made a broad inshore on the port tack—a very judicious move—and, tacking, crossed at 11.16m. 30s. *Seafarm* laid right out, fetching within a cable's length to leeward of the Automatic Buoy, when she tacked and rounded it, setting her topsail again, and increasing her already commanding lead of the *Albatross*. The latter could not weather Meagher's Beach Light, and went round on the port tack just inside of Horse Shoe Shoal buoy, standing on toward the western shore till she was in the *Seafarm*'s wake, when she stayed to starboard, but not laying up as close as *Seafarm*, had to make a longer board to round the Automatic Buoy. The two yachts now ran for Commissioner's Point Buoy. *Albatross* set a squar sail to port, but could not diminish the distance between herself and the leader, and had not rounded Commissioner's Buoy when *Seafarm* passed the Lumber Yard wharves at 4h. 13m. 85s.

In the sloops and yawls race *Hebe* and *Kestrel* simply ran away from the fleet, making a match of it for the handsome first and second prizes. Mr. Yorston did not get round from Pictou in time with his yacht, the *Ship*, 10 tons, and much regret was felt at this by his fellow-members, but *Pionia*, the new yacht from Shelburne, made her first appearance in the racing lists and *Albatross* sailed a plucky race, but was entirely overmatched, and had no chance as soon as Point Pleasant was passed. Till then, however, she held her own with the *Psyche*, *Mystery* and *Fiona*. The line was crossed in the following order:

<i>Hebe</i> , slip, 7 tons, J. Butler.	H. M. 8.
<i>Edith</i> , slip, 6 tons, W. Atkinson.	1 27 55
<i>Kestrel</i> , slip, 15 tons, Vice-Com. White.	1 38 26
<i>Mystery</i> , slip, 4 tons, J. Fraser.	1 42 21
<i>Psyche</i> , slip, 1 tons, Lt. Capt. Cure, 20th.	1 59 21
<i>Pionia</i> , slip, 7 tons, J. Fraser.	1 59 25

Gaff-topsails and balloon jibs were set on every craft for the reach up to Commissioner's Point Buoy, *Hebe* and *Kestrel* at once singing each other out and rushing to the front in grand style. *Psyche* sailed *Mystery*, and *Fiona* closed, with narrowly shaving Cape Island; the *Hebe* sailed a plucky race, but was entirely overmatched, and had no chance as soon as Point Pleasant was passed. Till then, however, she held her own with the *Psyche*, *Mystery* and *Fiona*. The line was crossed in the following order:

Hebe, therefore, sailed the course in 24 seconds less than *Kestrel*, and having to receive an allowance of 7m. 2s. for difference of tonnage, took the first prize by 7m. 25s., the *Kestrel* taking second.

Mr. Yorston arrived from Pictou on the following Monday, August 26, having encountered headwinds all the way. His yacht, the *Ship*, is a sloop of ten tons, carrying a large and handsome mainsail. She is very broad and very shallow, admirably adapted, in fact, for sailing in smooth water, but not the sort of craft to go cruising outside in. A race was gotten up for her benefit, the champion *Hebe*, sloop, 8 tons, Mr. J. E. Butler, and the *Psyche*, sloop, 7 tons, carrying the sails against her.

It was blowing a good breeze from S. when the three yachts were sent off at 1h. 52m. 10s. the *Ship* leading across the line. *Hebe* went into first place, however, before they broke their tack under the island, and from that time steadily left the Pictou yacht, holding a better wind when closehauled and running faster when going free. *Psyche* was early out of the race, which was unfortunately not finished, the wind falling fast and leading to the boats being becalmed a few yards from the finishing line, *Ship* a very long way behind. It was 7.10 p. m. when *Ship* gave up, followed by *Hebe*.

The race for five-tonners, on Saturday, August 31, proved quite a success and resulted in an easy victory for *Muta*, built by Mr. J. Butler. The yachts had not gone far before the breeze came from the W. and freshened up so much as to send the spinning over the course in very quick time. *Muta*, although late in her start, caught up and passed *Edith*, between whom and *Lily* there was subsequently a keen contest for second place. Running and reaching *Edith* held her own with both other yachts, but close hauled they gained on her, *Muta* especially, screwing out to windward in fine style. The yachts crossed as follows: *Edith*, sloop, 6 tons, W. Atkinson 1h. 41m. 34s.; *Muta*, sloop, 6 tons, Lt. Hussey, R. E., 1h. 46m. 54s.; *Lily*, sloop, 5 tons, W. D. Wood, M. D., 1h. 45m. 25s. All carried mainbooms to port and spinnakers to starboard,

with gaff-topsails aloft, but they were barely across when the breeze failed and they had a turn at pickaxe drill on the long swell. The wind hauled to W., and *Muta*, first noticing this, jibed her mainboom to starboard and at once crept away from *Edith* and up to *Lily*, who waited till the last put her into the new breeze, jibed then, before they realized the situation. *Muta* showed her spinnaker as far forward as she could, but it did her little good; she should have set it as a balloon-jib, when it would have done great service. *Edith* shifted hers for a small flying-jib, and lifted along in capital fashion as the squalls increased. *Muta* and *Lily* then stowed spinnaker, the latter attempting to re-set her gaff-topsail, while she lay handed, but failing to do so satisfactorily until after she had rounded Ferry Buoy. *Muta* was now down to the rail and close after the leader, which jibed round Commissioner's buoy, as also did *Lily*—a mistake, for they were running by the lee, the wind having here hauled a trifle more northerly. *Muta* kept her mainboom to starboard and collared *Edith* about half way across to Dartmouth. The time round Commissioner's Buoy was: *Edith*, 2h. 9m. 23s.; *Muta*, 2h. 9m. 30s.; *Lily*, 2h. 11m. 58s.

Muta now was bound to lead, and did so round Ferry buoy, jibing at 2h. 13m. 15s., while *Edith* hauled her wind round it 11s. later, and *Lily* at 2h. 16m. 23s. The three were now close hauled for Point Pleasant, heading up all they could, Butler's little clipper steadily leaving the others and settling out to windward of them. *Muta*'s crew now committed one of the most remarkable blunders possible. They jibed her gaff-topsail, which was set as a balloon-jib, and then up all they could, screwing her into the wind, pointing her toward Asylum flagboat. This was "nuts" for *Edith* and *Lily* as they kept right on for the proper mark, but yells of warning from the squadron steamer soon apprised the three gamblers on board *Muta* of their mistake, and the way in which that mainsheet was hauled aft was a caution! The blunder lost the leader a good half minute, but spite of it she was not to be beaten. *Edith* and *Lily* had to make a short hitch across the shoal to fetch clear. It should have been "up spinnaker" at once on board *Muta*, but there was something wrong with the gear, and Ives was passed before the sail went up to the mast head, when, crack! down it came by the run, halliards carried away. By this time *Edith* had jibed round Pleasant and was fouling along her to diminish *Muta*'s lead. Commissioner's *Muta* only could be timed at 3h. 30m. 10s., and from here, close hauled, she lengthened out her lead of *Edith*, while *Lily* greatly diminished the gap between that yacht and herself. The time at the finish was: *Muta*, 3h. 46m. 37s.; *Edith*, 3h. 55m.; *Lily*, 3h. 59m. 34s. Allowing for difference of time at start, *Muta* beat *Edith* by 11m. 54s., and *Lily* by 12m. 37s. *Edith* beat *Lily* by 48s. only. *Muta* took the prize.

The system of allowing for difference of time at start might well be reconsidered by the squadron, for its abolition would tend to promote the interest of a flying start and to bring out the seamanship of the racing crews, as each would be anxious to secure the weather berth. The yachts, instead of crossing at long intervals, would be dispatched in a bunch, and as the time for tonnage is known it would be easy for any one to tell whether she was or was not the winner. The most brilliant of the squadron took part in the racing season, the most brilliant in Halifax waters, on Saturday, September 7, with a race open to all rigs and classes. They have already sailed seven races this summer and have had good entries every time, so that they deserve to be congratulated on the way in which they have kept up the mainly sport of yachting in Nova Scotia waters.

The *Yozya*, s. sl., 100 tons, J. T. Holson, Esq., Royal Mersey Yacht Club, arrived here on the 3d of September, from Montreal via Quebec and Labrador. She returns to Montreal about the 10th, her owner residing there. Mr. Fraser has changed the name of his new yacht from *Lochnagar* to *Fiona*. She is not as swift as Fife's clipper of that name.

YACHTING NEWS.

EMPIRE YACHT CLUB.—The regatta of the Empire Club of Hudson, N. Y., which had been postponed from June last, was sailed Thursday, Sept. 4, in a stiff southeast wind. Course from foot 104th st., Harlem, through the Gate, pass between North and South Brother Islands, to and around the Gangway Buoy and return; distance twenty-three miles. Start from an anchor, catamarans fly. While making for the starting line *Emma* D. captured the fourth-class prize, losing one of the most formidable competitors. The *Mary* D. likewise captured before the start. The yachts got away as under:

Names.	Owners.	Length.	Start.
<i>Taratella</i> .	F. Hughes.	21 06	12 55 25
<i>John Gilpin</i> .	Do.	21 06	12 55 25
<i>Wanda</i> .	George Roahr.	20 00	12 55 25

Nearly all had a reef down. Among the catamarans *Taratella* had it all her own way. She made a fortunate start and was well ahead when the *Gilpin* carried away her iron bobstay and had to run for home. The tide was on the last of the flood, and it was a bent up to the mark. The *Colinda* got a knockdown, and *Ping* U'g'v. went to her assistance, both giving up the race, only *Cora* D. remaining in her class and taking the prize after a walk over. Around the gangway, *Taratella* led by nearly twenty minutes, *Martha* M. second, *Katie* third and the rest at short intervals, *Isabella Bean* bringing up the rear. Catamaran *Minnie* D. *Della* gave up. Why there should be such wide divergence between her and Mr. Hughes' craft is a matter on the same principles. On the run home, *Emma* was trimmed to starboard. Off Throg's Neck, *Katie*, while shaking out her reef, was struck by a smart puff and

turned turtle without further ado. The winners finished in the following time: *Taratella*, 2h. 37m. 35s.; *Martha* M., 3h. 50m.; *Chester A. Arthur*, 4h. 9m.; *Sophia Emma*, 4h. 32m.; *O'Brien*, 4h. 39m.; and *Cora* D., 5h. 19m. 16s. *Muta* was the victor in the prize for making the fastest time in the jib and mainsail class. The catamaran at times reached 15 miles on the run home with the wind abeam.

CHALLENGE TO STEAM YACHTS.—Mr. F. Hughes, owner of the catamaran *Taratella*, will match his craft against any steam yacht over a ten-mile course for \$1,000 a side, both vessels to be limed and given five chances over the course; the fastest time to take the money.

BOUND FOR FLORIDA.—The *Embassader*, schooner, Mr. Wm. B. Astor, is fitting out at City Island for her annual cruise South.

GOOD SEAMANSHIP.—The manner in which *Udo*'s canvas was managed on the recent cruise of the N. Y. Y. G. calls for decided commendation on our part. Her crew were fully dressed in uniform and ready for "inspection" at any time, while her canvas was handled quickly and with more show of good seamanship than aboard most the other yachts. She was sailed in a way creditable to her skipper and owner alike. We understand that *Udo* and *Peerless* are soon to sail a match race in metropolitan waters.

OCEANIC YACHT CLUB.—The Oceanic Yacht Club, of Jersey City, have elected new officers as follows:—Commodore, George Smith; Vice-Commodore, J. O. Cockrell; Secretary, John Facknor; Treasurer, Louis Heller; Measurer, John Demarest; President, James J. Reid.

PATONIA YACHT CLUB.—The sixteenth annual regatta of this club was sailed off Lafayette, N. J., Aug. 29. Course from Murphy's club house, through channel between Ellis and Bedloe's islands, thence to Robbins Reef buoy, thence to buoy No. 10 off Cooney Island Point and return. Third-class yachts went around Robbins Reef buoy only and return, sail Cooney over. Won by J. M. Koster in first-class, 3h. 37m. 25s., beating *Clara* B. *Annie Gisel*, *Fulton*, *Medusa*, and *Fron-Frou*. In second-class by *Addie Taylor* in 3h. 33m. 37s., beating the *Holmes*, O. K. and *Prospect*. In third-class by *The Brothers* in 2h. 54p. 34s., beating the *Edgar*, *Guskie*, *Robin*, *Nellie Shaw* and *Shoghran*.

NAHASSET YACHT CLUB.—Mr. Editor: This club will give one more regatta, in September, for a silk pennant and the championship of the club. Open to all cat-boats in the club, and to be sailed for will time allowance and mainsail only.

KEEL-BOATS IN BOSTON.—The discussion of the superiority of keel-boats at sea has assumed decided shape in the neighborhood of Boston. A gentleman has placed a forfeit in the hands of the Boston Herald, and offers to make a match with any keel-boat in that vicinity between 20ft. and 40ft. water line upon the following conditions: Race, ten miles to windward and return, in a breeze blowing twenty miles an hour or over, outside Boston Light. Stakes, \$50 a side; no shifting of keels or light sails allowed. The challenge should not pass unheeded among Boston yachtsmen, among whom the Corinthian spirit runs high.

DORCHESTER YACHT CLUB.—The Dorchester, Mass., Yacht Club will hold its next regatta off Commercial Point, Harrison Square, Boston, Tuesday, Sept. 17. First class centreboards, 25ft. and upward; second class centreboards, 20ft. to 25ft.; third class centreboards, under 20ft. All keels will be sailed in one class. Special class for boats under 14ft. Coe, J. J. Sunning, and *Julia* Thoma. Moderate breeze from S. E. *Sunning* led off, but *Elena* D. and *Ida* took the lead and maintained it throughout, both taking first prize in their respective classes, second prizes going to *Sadie* and *Guendolen*. The sharpie *Bertie* gave up the race, but went round the course with outrigger ballast and made good time. We note with gratification that the Monmouth Beach Yacht Club has given its adherence to the principles advocated by these clubs, and we understand that the ban of shifting ballast will be permanently abolished in the May. Others follow their example. *Lenora*, Mr. Lamphar, and *Lisette* R., Rathbone Bros., sailed a match the same day. Won by the latter on time.

THE VALUE OF ORGANIZATION.—The steamboat law, requiring a liberal supply of life preservers on board of every steamer, is a wise one, as was amply illustrated Wednesday, Sept. 4, when the launch, *Little Charlie*, collided with the police boat *Seneca*, on the Harlem. A shower of life-preservers were thrown to the passengers of the launch who were struggling in the water, as the boat sank under her load. They were all rescued without much trouble by the *Seneca*'s crew. For saving life in any emergency there is nothing like a good outfit of the required apparatus and thorough discipline. Had our steamboat laws been in force on the Thames, England, many lives would have been saved from the sinking *Princess Alice*, run down by a collier recently.

A BRITISH YACHTSMAN GRADUATE.—Crawling in at the hawse-hole and coming out at the cabin windows is quite a common method in England by which their leading yachtsmen have come into prominence, and in many instances developed into full-blown sailors and pilots. Commencing with a small craft, in which they and a boy or two did the hauling and tugging, splicing and patching, and painting and navigating, they gradually grew up in larger and more pretentious yachts until they finally blossomed out in a big schooner or steamer in which the world may be circumnavigated. This is how Mr. Thomas Brassey learned his trade as a yachtsman, and won fame in later years as a seaman and pilot of skill second to none who make sea and the profession of a life-time. After going through the usual period of probation in whittling models and sailing toy crafts on ponds and puddles, he found himself sole owner and cook of an eight-on cutter. Having mastered fore-and-aft seamanship, and acquired the rudiments of navigation by dead reckoning, he stepped aboard a twenty-three, and then hoisted his burgee at the mast-head of a fine ship of 100 tons. In her he cruised three years in the British Isles and the North Sea, and then next became owner of the *Albatross*, iron schooner, 118 tons and sailed in her to the Mediterranean. After his marriage he took to auxiliary steam, for Mr. Brassey holds that steam is an ex-

GREENWOOD LAKE.—On the 9th a party of gentlemen had fun sport at Greenwood Lake, with black bass, blue fish, etc. Blackford, with a six-ounce split bamboo rod, caught the finest fish, weighing five pounds. Between 7 A. M. and noon a number of large fish were captured. While fishing the party were startled by a succession of flutterings and splashings in the water, and it was found that a covey of quail, in attempting to fly over the lake, about a mile wide, had fallen in the water. The unfortunate birds were dropping like stones, and on the boat to rescue the quail. Fifteen fine birds were caught, only one having been drowned. The birds were secured and

have been caged. Sam Garrison, who is thoroughly posted about the fish lake and the birds on the shores, had the party in charge. The best fishing for black bass is found off the Brandon House Dock.

VIRGINIA—Lexington, Sept. 7.—Bass fishing in the James River, at Varner's Falls, is good. A party of three caught sixty there the other day in six hours fishing. They averaged two pounds each.

SALMON AND BONITO.—The following letter has been received by Professor Baird from a gentleman thoroughly conversant with the fish and fisheries of Narragansett Bay:

NEWPORT, Sept. 2, 1878.
PROFESSOR BAIRD.—Dear Sir: Thinking it may be of some interest to you, I take this occasion to communicate two facts that came to my knowledge concerning fishes in these waters. First: Mr. Edward Lawton caught in a heart seine, at Brimston's Cove, last month, a salmon weighing 1½ pounds. Second: Captain Albert Gray saw last Friday, eastward of Block Island, an immense school of bonito—he thinks not less than 3,000 barrels—more, he says, than he ever saw of horse mackerel (bluefish). Yours truly,
J. M. K. SOUTHWICK.

A FISHING HOG.—This intelligent pachyderm hails from Aurora, Ind. He goes into the stream and catches his fish, plunging beneath the water, and, coming up with a big fellow in his mouth, comes to shore to devour him. Now, we all know that a pig is death on crabs. In the South, it is delightful to see a porker after fiddler crabs. The fishing animals seem to increase every day. We have heard of a fishing cat, dog and pig, and very shortly a horse and a cow will be found to be piscatorially inclined. Might we state, parenthetically, that we have known many fishing animals that deserved the porcine appellation; yet appetite never could be satisfied.

"PISCATOR'S" HERRING.—*Albany, Sept. 7.*—*Editor Forest and Stream:* In hopes that I may cast a little of light on the question, I send you the following in regard to "Piscator's" herring: In July, '77, between the 8th and 20th, these fish ran up the Black River as far as the village of Dexter, where their progress was arrested by the dam. We were constantly annoyed in the evening by their taking our flies when we were c. sting. The fish were so thick that one day a party were rowing through a school of them and were injured in the boat. In appearance these herrings were like our North River herring—dark on the back, silver underneath, and the same peculiar square-shaped mouth. Their stomachs compared to their backs was the edge of a razor to the back of it. Being possessed of a wonderful power for wiggling and squirming, they are not the most pleasant fish to handle. During their fishing was very poor, but soon as they left there were some fine strings of bass, pike, and large yellow perch caught out on the bar in Black River Bay. DEXTER.

"THEM WAS THE DAYS."—From the Battery to Hell Gate, in the East River, and to and beyond Carmanville in the North River, the New York docks are thronged on Sundays by striped bass anglers of every persuasion and color, every tribe and kindred under heaven and there are anglers who never catch anything, and urchins without rods at their feet catch all the fish, men who lug enormous creels, and carry them home empty, and small boys who run home with their pockets full, swells who scare the fish away with huge blazing diamond pins on glaring shirt fronts, and less pretentious cosmopolites, innocent of diamonds and shirt. Amid this motley throng the author, one made, and a mingled gratification to graybeard. Like his antiquated rod and weather-stained tackle he is seasoned with the years, and mottled with the storms and sunshine of a half century. Where once from the rocks he cast his slender and squid, drawing up a generous creel, now amid the cargoes of Atlantic steamships, he sits all day long

Like Patience on a—
spile "spillin" for a nibble. After the fingerling has been bravely headed, and safely dropped into the cavernous basket, his comeliness is overspread with a mingled gratification and disgust, and his garrulous tongue dilates to the reverential youngster upon the glorious catches of the years and years ago, when he was a boy. Yes, and here's bad luck to the commerce that has destroyed the old patriarch's sport.

A MAN AND A BASS.—All this happened at Norwich. Men were hauling seine at Niantic; big bass broke away from the meshes, and scuttled off for the sea; shallow water prevented his swimming. The *Norwich Bulletin* says something to this effect:

The men dashed excitedly after him, and vainly sought to stop him with desperate kicks from their heavy fishing-boots, and blows from such implements as they could pick up on the beach. No one dared to grasp the monster, as a bass of large size, armed with its sharp fins and razor-like teeth and gills, is one of the fiercest and most dangerous of sea-fish. At last Mr. Winship went for him, and at last Mr. Winship and the 46½ pound bass were hauled ashore.

WHIPPING A BASS.—*Editor Forest and Stream:* Not fully comprehending the meaning of "E. A. K.'s" answer of the 5th inst., I referred the same to some of our leading sportsmen, such as Messrs. Jones, Atkinson and others, none of whom were able to understand what was meant by "whipping a bass," "whipping" being an expression for throwing the fly with light rod and fly-line. My opinion was induced by these gentlemen that to drag the bass, when hooked, through the water, by swinging the pole right and left, is clumsy and unsportsmanlike, and frightens the remainder of the school. Why not lift the fish out at once with which might not prove quite so successful with the V. M. Pond anglers when playing a six-pounder. However, before condemning, Hartford sportsmen are anxiously looking forward to an explanation of "E. A. K.'s" method of "whipping a bass," and to the expounding of the new theories of the Wolcottville school. The gentlemen also endorse my opinion as to the correctness of our mode of fishing, which "E. A. K.'s" observation was so unpropitious to fishing. It is caused by decaying vegetation (rot rocks), and is therefore more frequent in artificially raised waters than in others. West Hill Pond was originally, some fifteen to twenty years ago, an exceedingly small and clear pond; it is now some fifteen feet above its former level and covers a

great deal of decaying vegetation. Its active springs are thought to be subsidiary in the frequent raising of its scum. Shuttle Meadow Lake covers a large quantity of brush and the like, and is, on account of its great quantity of scum, entirely unfit for fishing except in the fall. In the season, Twin Lakes are in their natural condition, and consequently free from scum. Black bass are said to shun this decaying matter, so far from feeding on it. "E. A. K.'s" vigorous appliance of the whip brings to mind the four Frenchmen in a heavy wagon drawn by one dilapidated and exhausted beast. When inquiring for some place, fifteen miles away, and being informed that they could not reach there at that night, they excitedly exclaimed like our author, "V. M. Pond, V. M. Pond, V. M. Pond!" May the ridiculous aspect of these foreign gentlemen serve as a serious warning to your "interesting and observant" correspondent, lest in his scientific and microscopic researches, he apply his whip too freely to his theories of rocky sediment and "whipping a bass." P. X.

A HOME-MADE BLACK BASS RODS.

EDITOR FOREST AND STREAM:

As the autumn fishing for black bass will soon begin in Kentucky, Tennessee, Northern Alabama and Georgia, and as the anglers in the several States are extremely partial to a natural cane or bamboo rod, I desire to tell them how to make a good one of this material at little cost, and which, though not a "thing of beauty," will prove itself a "joy forever," in comparison with the cane rod as generally used. After using such a rod as I am about to describe for one season, the angler will be ready to advance another step and adopt a good cane and lancewood rod, which contingency, I am free to admit, is the principal motive for this communication.

A natural bamboo cane, as it is procured at the tackle stores, is from fifteen to twenty feet in length, and it is the custom in the localities named to use from ten to twelve feet of the smaller end of such a cane for a black bass rod, after attaching a standing guide and a reel fastener. While such a rod is strong and light, with a moderate degree of pliancy and elasticity, it entirely lacks the great desideratum, balance, being decidedly too-heavy, and is too small at the butt to allow of a firm grasp of the hand, generally necessitating the use of both hands to hold it. Now to obtain the greatest amount of good and pleasure from a rod of this character, proceed as follows: Select a cane of medium length, which may be known by its dark, mottled markings, looking as though it had been burnt about the leaf-ridges, or knots. Select one that is hard and elastic, with a good taper, and quite small at the tip; those known as "male" canes are the best, having larger bulges, or leaf-ridges, and being much tougher than the "female" canes. Having chosen a good one, cut off six and a half feet of the smaller end for the rod, the remaining larger portion of the cane will make a good handle for a landing-net. Now make a wooden butt of white ash or black walnut, from eighteen to twenty inches long, of the following diameters: At the extreme butt end, seven-eighths of an inch; now increase the diameter by a gradual taper to an inch and one-eighth at a distance of five inches from the extreme butt; then decrease the taper to an inch at a distance of seven inches from the extreme butt. To make a good handle, make a reel seat, and an inch in diameter throughout its length; now decrease the diameter by a rapid, concave taper for two inches to three-fourths of an inch, and then a gradual taper to the smaller end of the butt, which must exceed the diameter of the large end of the cane about one-sixteenth of an inch; the diameter of the large end of the cane-joint when cut in two will be from half an inch to five-eighths of an inch. Having a pair of callipers, and the instructions just given, we have a cane joint six feet and six inches long, and a wooden butt, say twenty inches long, with the grip of one and one-eighth of an inch in diameter, and the reel seat of one inch diameter. Now procure a set of reel bands one inch inside diameter; a pair of ferrules for the joint—the inside diameter of the smaller ferrule being of the same diameter as the large end of the cane piece, which will readily be ascertained. Having a pair of callipers, five standing guides, graduated sizes, and a solid metal tip. These mountings should be brass or German silver. The guides should be attached at equal distances between the reel seat to the tip, and, having properly fitted the ferrules and reel bands, give the rod two coats of shellac, or coach varnish. When dry, the rod is ready for use, and will be about eight feet in length, and strong enough to handle any fish of moderate size, and will not break to any rod made for the purpose; it will be well balanced and strong, and will lack the pliancy, elasticity and perfect working of a good ash and lancewood rod, yet it will be such a great improvement on the cane rod as generally used, that it has only to be tried to be appreciated.

Cynthiana, Ky., Sept. 5, 1878. J. A. HENSHALL.

TROUT STREAMS IN COLORADO.

EDITOR FOREST AND STREAM:

Most if not all the streams I shall mention afford better fishing during July and August, and even in the early part of September, than they do in June. During June the snows on the mountains melting keep the streams too full, and the water is too low. By all odds the best day's fishing that I had last year was on the 11th of August. The St. Vrain River, almost everywhere among the foot hills, or even when it has reached the valley, i. e., plains, gives fine fishing. Trout weighing three pounds are frequently caught in it. The best fishing, however, in this stream is to be found in the canyon of the river. This is about sixteen miles from Longmont to the canyon. And R. H. Fair road leads from Longmont to the canyon. Any one who wishes to fish the St. Vrain at this point must camp out. A wagon containing the outfit cannot be driven up the canyon, it is therefore necessary to "pack" your traps on a mule or horse. Doing this, the narrow trail which leads up the canyon may be easily gone over. It is only necessary to go from six to ten miles in this way, and I can safely promise any one who wishes to do so that the small trouble I have mentioned that he will be fully rewarded, both by the enjoyment of the trip and scenery, and the pleasure he will have in the fishing. The impossibility of going up the canyon in a wagon has prevented the stream from being fished much at this point, and so the sport remains excellent and will do so for years to come.

The "Big Thompson," which takes its rise near the foot of Long's Peak always runs at angles. The readiest way of reaching it from Denver is via the Colorado Central R. R. to Longmont, and a stage journey of thirty-six miles from that point through the Rocky Mountains to one of the loveliest spots in the mountains, or indeed, for the matter of that, in the

whole country, namely, Estes Park. Here, if you wish to live as comfortably as you do at home, you may stay at the Estes Park Hotel, a new house built last summer, thoroughly well furnished and kept in the best manner. If you stay here you will have the privilege of fishing in the "Meadows," a lovely tract of about a bushel of fishing with line or fly, without charge, which is kept for the use of the guests of the house. By camp out, say I; make the Park your headquarters from which to take excursions in various directions. Ten to fifteen miles down the Thompson, where you must be content to go with such things as you can carry yourself, you will find fish that will repay you for all your pains. I believe there is some sort of cabin about ten miles down the stream down the Park, which was erected expressly for the benefit of fishermen. The North Fork of the Thompson is reached by a pack trail, and is 10 miles from the hotel. Here is a good cabin which will hold several persons, and which can be used free of charge by all who choose to do so. Take your cooking utensils, which should be few and simple, and some canned fruits and vegetables, and you may spend ten days most pleasantly fishing. It is said that blue grouse are to be found there. I never saw any, though others say they have.

The upper canyon of the Thompson in Willow Park will repay a visit to it. It is six miles from Estes Park, and is reached by a wagon road. Take your tent with you, or, if you prefer, stay at Sprague's ranch. Do not attempt to fish in Willow Park; you will be devoured by buffalo flies. Go about ten miles down the stream down the Park, which was erected expressly for the benefit of fishermen. The North Fork of the Thompson is reached by a pack trail, and is 10 miles from the hotel. Here is a good cabin which will hold several persons, and which can be used free of charge by all who choose to do so. Take your cooking utensils, which should be few and simple, and some canned fruits and vegetables, and you may spend ten days most pleasantly fishing. It is said that blue grouse are to be found there. I never saw any, though others say they have.

Through Middle Park in the northern part of the State flow the Blue River and Williams Fork. This latter I have never fished, but I am informed by those who have that the fishing is good. The river now when a four-pounder is taken. Williams Fork is reached from Denver by rail to Boulder, and thence to Hot Springs and the Park by stage. At Hot Springs there is a hotel, and from this excursions may be made to the Fork on horseback.

The Blue River may be reached in this way, also, though the best way would be to go to Colorado Springs and thence up the Ute Pass on horseback, or, still better, with a wagon. It is but a few miles from Colorado Springs to the mouth of the great quantities of large fish. It is one of the best trout streams in the State and will amply repay a visit. The scenery, too, cannot but afford high pleasure to every admirer of nature. The trip up the Ute Pass and through the various intervening small parks is worth all the trouble even were there no other object in view at the end of the journey.

And now, if you are not already tired, let me ask you to take the train to the Rio Grande and go to the southern end of the State. Stop at Garland and fish in any of the mountain tributaries of the Rio Grande. The Trinchero or Trinchera, as it is indifferently called, is six miles from Garland. It is full of fine fish. Last summer Gen. L. of Pennsylvania, came out to fish; he was the guest of Gov. Hunt. The Governor took the General, who was accustomed to small fish of the Rio Grande, to the mountains. By and by he (Governor) heard a great noise and saw a large fish lying through the air. The General, in his excitement, regardless of tactics, had jerked it out and thrown it over his shoulder. "What is the matter?" exclaimed Hunt. "Oh, I have a slug of mutton on my hook," was the reply. It was a three-pound trout. Alamosa, thirty miles further south, will soon be reached by rail. The streams here are equally good. The trip over the Denver and Rio Grande Railroad, passing, as it does, over the Sangre de Christo range, and through the Veta Pass at an altitude of 9,393 feet above the level of the sea, affords a view of some of the grandest scenery in the world. The Mule Shoe of the railroad causes the celebrated Horse Shoe of the Pennsylvania to divide into insignificance.

I have only mentioned a few streams as a personal acquaintance or have been reported to me by friends, upon whom I can rely. There are, however, many others. Nearly all the mountain streams contain trout. In conclusion let me say a word as to the pleasures of camping here. I know of no place where it yields more pleasure and profit. The glorious, exhilarating air, the bright sunshine and the almost cloudless sky combine to make camping enjoyable and health-giving to an unusual extent. C. B.

COLUMBIA RESERVOIR AND FISHING.

Columbia is the extreme southern town of Tolland County in Connecticut, and the Columbia Reservoir is situated in the northern part of the town about equidistant and three miles from Andover and Hop River stations of the U. P. and N. H. R. This reservoir was raised by the Williamstown Lumber Co. as a reserve force for their thread manufactory in the year 1866 and covers nearly three hundred acres when at its full head, and required a good part of the year to fill it with water. Soon after it was filled the citizens of the town, by their own individual efforts, secured some pickerel and black bass, and purchased the waters for the purpose of stocking it. The two secured the passage of an act of incorporation, which by its terms became operative on the first day of January, 1870. As at that time the reservoir was covered with ice, and for weeks the piscatorial sports was indiscriminate; hundreds of people visited the reservoir, and it was estimated at the time that on some days as much as (one of fish was taken, all of pickerel. The result was a subsequent dearth of fishing, which necessitated the enactment of other laws regulating fishing through the ice. From that time onward but few pickerel and scarcely any bass were caught, and all was attributed to the belief that they were destructive to other fish and too sportive to be caught by the average fisherman. This belief has been somewhat discredited by more recent results, which we believe are worthy of mention and are contained in the following record, viz.:

August 6.—William A. Babcock, of South Coventry, and William H. Yeamans, of Columbia, made a catch of fourteen bass of very uniform size which would have averaged less than two pounds each, but were not weighed.

August 7.—Babcock and an eight-year old son of Yeaman's caught three bass, but in attempting to put them over the side of the boat to lose in the water he lost two. The eleven remaining weighed twenty-eight pounds.

August 15.—Babcock and Yeamans caught twenty-two fishes which weighed forty pounds.

August 30.—Babcock, Yeamans and J. V. H. Prince, of Brooklyn, N. H., eleven, all of good size, but not weighed.

August 26.—Babcock, Yeaman, Prince and Lucien Hicks, of South Coventry, caught fifty-one, which were variable in size, weighing about seventy pounds.

August 29.—Babcock, Yeaman and Prince took fifty pounds in weight, the heaviest weighing three and one half pounds.

August 30.—Yeaman went out less than an hour and took seven and three-fourth pounds. In each case considerable numbers of other kinds of fish were caught, but not picked.

September 2.—Babcock and Prince caught twelve of good size.

September 4.—Yeaman and S. H. Moran, of Hartford, took sixteen, twelve of which weighed twenty-five pounds. Other parties have fished here with good success, but we have not the record.

Columbia, Conn., Sept. 5, 1875.

RESERVOIR.

Game Bag and Gun.

GAME IN SEASON FOR SEPTEMBER.

Moose. *Alces melampus.* Black-bellied plover, ox-eye, *Squataria helvetica.*
Elk or wapiti, Cervus canadensis. King plover, *Agelaius pensilvanicus.*
 Red or Va. deer, *C. virginianus.* Killdeer, *Spizella monticola.*
 Quail, red, black and gray. Stilt, or long-shanks, *Himantopus nigricollis.*
 Hares, brown and gray. Woodcock, *Philohela minor.*
 Teed or rice bird, *Doctolophus oryzivorus.* Red-breasted snipe, or dowitcher, *Macrophalarus griseus.*
 Wild turkey, *Meleagris gallopavo.* Red-jacketed sandpiper, or ox-bird, *Tringa americana.*
 Pinnated grouse or prairie chicken, *Cupido americana.* Great marshy gull, or marlin, *Limosa fedoa.*
 Ruffed grouse or plover, *Bonasa umbellus.* Willet, *Totanus semipalmatus.*
 Quail or partridge, *Ortyx virginiana.* Yellow-shanks, *Totanus flavipes.*

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oystercatcher, surf birds, phalaropes, avocets, etc., coming under the group *Limacola* or Shore Birds.

GAME IN MARKET—RETAIL PRICES. Poultry and Game—Pinnated grouse (prairie chickens), \$1.00 per pair; partridge (ruffed grouse), \$1.50 per pair; teal, 50 cents per pair; Wilson snipe, \$3 per doz.; plover, \$4.50 per doz.; bay birds, large, \$3 per doz.; do small, 50 cents per doz.; rails, 75 cents per doz.; reed birds, 40 to 75 cents per doz.; Philadelphia squabs, \$2 per doz.

Poultry—Philadelphia and Bucks County dry picked chickens, 18 to 22 cents per pound; do, fowls, 18 to 13 cents; do, turkeys, 18 to 20 cents; do, ducks, 18 cents; do, geese, 18 cents; State and Western chickens, 16 cents; do, turkeys, 16 cents; do, fowls, 16 cents; do, ducks, 16 cents.

CANADA—Montreal, Sept. 3.—The shooting season has fairly commenced here. Yesterday everybody that owned or could borrow a gun was out. Some fair bags of woodcock were made, but other kinds of game are scarce. STANSTEAD.

MAINE—Princeton, Sept. 2.—Deer are very plenty.

W. P. P.

MASSACHUSETTS—Nantucket, Sept. 9.—Plover quite plenty; no doubt the thick fogs have caused them to stop. Saturday I saw a great many birds. Black ducks are plenty on Dry Shoal. JACK CUDDELL.

CONNECTICUT—Noroton, Sept. 1.—There are a great many quail here this fall. Yesterday I flushed two flocks in a potato lot not 200 yards from my house.

SCORE TWO FOR SETS.—"Moose," a Germanstown sportsman, has been on an Adirondack expedition, and while in mad pursuit of his prey managed to shoot a bull (not a moose), for which he compromised with the farmer by the payment of \$150. All of which is truthfully related in the Germanstown Telegraph, with this bit about the veteran New York fish-culturist:

We saw many curious things while in these glorious mountains—for glorious they truly are. No wonder Seth Green is about building a tower to be called Troutville. Seth is also a good shot. We met him there three weeks ago, and saw him from one side of a stream shoot two deer on the other side at one shot. Of course they were standing side by side, or he could not have done it. At the very time, too, he had hold of a supposed ten pound trout, which, on dropping his pole on drawing a bead on the deer, floated off with it, and that was the last seen of that pole. Seth was a good shot, disappointed at losing his pole, line and ten pound trout, but he is a man of a very patient and forgiving nature, made use of no improper language, and was thankful for the two deer at one shot, as that feat had never been performed in the Adirondacks before.

PENNSYLVANIA—Mercer, Sept. 3.—The Solid Comfort Club just came home from their camp on Sugar Lake yesterday. The woodcock shooting has been good here, and the prospect is good for all kinds of small game this fall. M. B. McK.

DELAWARE—Port Penn—Delaware Bay, Sept. 5.—Rail and reed bird shooting now good; birds abundant along the Bay, and will be all this month. This is a good point. Take the steamboat, Thomas Clyde, any morning from Philadelphia, fare about fifty cents. Stop at the Pier House on the beach, kept by Mr. Lloyd. \$1.50 per day, or \$8 per week. Game close at hand. H. W. MERRILL.

RAIL AND REED BIRDS—Pier House, Port Penn, Sept. 8.—Following the directions of the Sportsman's Gazetteer, I secured a week's shooting on the pier, and the shooting of bay birds. As you state, the rail and reed bird shooting is most excellent here. I doubt if a better point can be selected along the whole Bay. The birds are always here during Sept. and the rail till about Oct. 15, when both kinds disappear with coming frosts. The sporting is near the hotel, and very convenient. I send you a sample of a day's sport, from which you will see we have plenty of delicacies for the table. Rail Sept. 6: S. Lord, 37; J. W. Gibbs, 32; P. Wain, 38; G. Tate, 36; W. H. Lull, 35. C. Tate and son, 73 white perch, and 40 crabs. The above was on one tide and occupied about four hours only. As for reed or rice birds, they are being killed daily and everywhere along the shore. Every morning and evening as they fly across the lawn in front of our hotel a general fusillade is opened on them, and enough secured to supply all our wants. The Sporter's Club, kept by T. Lord, is plain and comfortable. He is a sportsman, and keeps two good dogs for his guests to use at pleasure, also boats etc. The steamboat, Thomas Clyde, from Philadelphia, touches here at 11 A. M., daily, fare 50 cents, and on returning, at 4 P. M. Only railroad to Delaware City four miles above this place. Hotel fare \$1.50 per day, or \$8 per week; boatpushers \$3. Next month the snipe shooting will be good, with ducks, etc. M. H. W. MERRILL.

YOUNG AMERICA CLUB.—The Young America Sporting Club, of West Phila., was organized Aug. 7, 1878, with the following officers: Harry G. Cochran, Captain, 4229 Ludlow st.; Ben S. Marshall, Treasurer, 221 N. 41st st.; W. J. S. Blundin, Secretary, 2951 Story st.

TENNESSEE—Nashville, Sept. 4.—Mr. Clark Pritchett, Secretary of the Tennessee Sportsman's Club, has had some good dove shooting the last two weeks. Taking it very leisurely, and hunting only in the cool of the afternoon, he bagged from five to eighteen birds each day. Our game laws allow shooting to begin on the 15th of this month, but the fields and covers will be full of hunters to-morrow, so that by the time the law abiding sportsman begins his shooting season the birds will have become very wild. There are some quantities, however, that there will be enough for all. J. D. H.

A DAY AMONG THE CHICKENS.—A Texas correspondent writes us from Houston, Aug. 26, of the amenities of the sportsman in that vicinity. We commend the paragraph to the consideration of those who may be skeptical as to the abundance and variety of Texan game:

"I had intended ere this to give you a sketch of a day among the prairie chicken, which are very abundant here, and are now in fine condition for shooting, but the weather has been so bad that it has been impossible for us to get out. The rainfall has been unusually large for this season of the year. The ground is covered with water; the sun so oppressively hot that our dogs are unable to work more than a few minutes at a time, frequently returning to the wagon, or else seeking the shade of some bush or tree, from which they refuse to move. Add to this the swarms of green-headed flies, which cover our horses, rendering them almost frantic, the anemic and mosquitoes, which almost obstruct our sight, and then draw on your imagination for the pleasure so easily to be derived from 'A Day Among the Chickens' at this time. J. W. D.

HOW TO LOAD DITTMER POWDER.—Editor Forest and Stream: For the benefit of any who have failed to get uniform results in the use of Dittmer powder, allow me to give the following directions for loading; if carefully observed no complaints will ever be found with its performance. Dip the measure heaping full, tap it a few times until it settles even, empty into the shell, striking that a few times so it settles even in the shell. This is important. Use one Delaware fibre and one Eley's pink edge, or two pink edge, which fit tight in the shell, requiring a little pressure to drive them down, striking the rammer once or twice with the hand; then put in shot and one black edge wad and crimp the shell well. Shells loaded in this way will equal the execution of those loaded with best black powder, without the noise, dirt and smoke which is so objectionable. Haines, agent for Mr. Carver, informed me that out of the thousands used by the Doctor, and loaded in this way, never had one failed in any respect. H. C. S.

DECAYS.—Mr. H. A. Stevens, of Woodsport, Cayuga Co., N. Y., has sent us samples of various decays of his manufacture, which are excellent. The Stevens decays are made of cedar, are unusually natural, and the heads being moveable, can be packed in very small compass. But one grade of decays are made. The list includes canvas-backs, mallard, black, teal, scaup, golden-eye ducks, with teal, etc. As Mr. Stevens has generally as his order to fill, he can fill, it would be well for duckers to get their supplies early.

RABBIT.—In some parts of New York and New Jersey orchard men this year, first and last, have had a great many all night, mowers cut them to pieces in the dry fields, and bring them into the house by the wholesale, the small boy pursues them with ferrets, and between them all an unfortunate vagabond is the tramp who cannot strike a good square rabbit stew for his noonday repast.

The Montgomery Shooting Club have contributed to the amount of \$150 to the yellow fever sufferers in Memphis and New Orleans.

For Forest and Stream and Rod and Gun.

LEAVES FROM A RAY OF WESTERN TRAVEL.

(CONCLUDED.)

RAWLINS, Wyoming Terr.
 Aug. 8th.—After breakfast Jack and Frank with the rifle, and I with the shot-gun, went out hunting. I bagged four blue mountain grouse, and in the afternoon Frank killed three and Jack one. These birds, which some call blue grouse, are here in great numbers, and are of fine flavor. Two of them weighed two pounds and fourteen ounces each.

9th.—Started from camp 7.30 A. M. to go to Battle Lake. But it was no go! After eight hours horrible tramp through thick bushes, fallen timber, over rocks, in a hard rain-storm, we all felt tired, and concluded to give it up for that day and go to camp. Before we got down to the creek Tip killed a deer, and we shot at an elk pretty far off without doing him any harm. Our camp outfit was, although it was covered, a pretty camp, and the first thing when we stopped was to make a big fire and get warm and dry. The rest was to cook dinner, which we were anxiously waiting for, as our appetite was grand. My friend, Frank, ate half as much in meat as the weight of his body, not to speak of the flapjacks. In half an hour we were quite different men, and smoked another pipe of peace. This time 8.700 A. M. high, in the narrow valley of the main branch of Battle Creek we were surrounded by high wooded mountains. We did not feel very comfortable here, but still had to stay another day in order to send the guides out to look for the lake. We passed an unpleasant night, as all our camp outfit, as quilts, blankets, etc., was damp. The next morning, on the 10th Aug., Jack and Tip started to hunt for Battle Lake, while Frank and I went out fishing. The trout were not very hungry, and did not take fly well, because there was so much foam, and did take the trout for them by the freshest, still I caught enough for our table. At noon the guides came back, bringing us good news. They found the lake about two miles off. We could have gone there the same day, but we thought better to wait till our bedding was dry again. To speak of the trout I caught here, I never saw *Salmo trutta* like them before.

11th.—Early in the morning we started for the lake. There we arrived after a half-hour's riding over rocky hills and thickly fallen timber. What a wonderful panorama we had after we had ascended the last hill. I am not able to describe it. A fine, but rather small, sheet of water before us, about 500 or 600 yards long, and 300 yards wide; was surrounded on one side by a steep, bare rock, 1,000 feet high; on the other sides by high wooded hills. The water of the lake was

as smooth as a mirror, and we saw hundreds, even thousands, of small trout playing or rising to the surface for insects. Toward the high rock the water seems to be very deep, but on other parts pretty shallow. Frank and myself being so tired, we had not to wait very long for our train, and then we rode slowly along the lake to the place where, several years ago, Prospector (gold digger) had built a log-house. This we used for camp, being large and dry. That it did not take very long for me to get ready for the trout you will imagine. The pool was so hungry that they came to us on shore where we were standing, waiting for our artificial flies, and even bare hooks. I fished all around the lake, and caught several hundred, but put them back again, as I left it to Frank to furnish our table. He only fished a while, and caught his basket nearly full. Never in all my fishing have I found a pond or lake so well stocked with trout as this Battle Lake, but we did not catch a larger fish than one pound six ounces. I think there was too little food for the great number of fish.

On the second day, Aug. 12, I cleaned fifteen fish, and found worms in five of them. Of course I threw them away, and we did not eat any more fish out of the lake. Frank took the anemic and climbed up the high rock near the lake, where he found that he had ascended 1,000 feet; the top was 10,150 feet. The same day, all of us, Tip with Frank and Jack, went to the high rock, the water was so lucky as to kill a doe elk and spikebuck elk, and could have shot many more; we could have killed some, too, but, having enough of meat, did not like to slaughter them. We found elk by the hundreds, but no large bucks, and could get close up to them. We ascended mountain after mountain, very heavily wooded on the lower parts of them, while on the tops only bare rocks and snow, and at last we got up the principal peak of this range, and found that we had ascended 10,000 feet. We were on the great divide between the Pacific and Atlantic, and on the line between Wyoming and Colorado. The view from here was grand. We saw nearly all the high peaks of the northern part of Colorado, as well north of us as the Elk mountains and some other high ranges. The wind was blowing very fresh, so we did not stay long, and rode down again to our camp. I tried the trout once more to hook bigger fish, but without success. The trout were so fat that they threw in, and would have taken "a red-hot stove," as my friend, F. Endicott, likes to say.

Although the elevation we were traveling on now was from 9,000 to 11,000 feet, the vegetation was luxuriant, while we found on the lower plateaus, 6,000 to 8,000 feet, scarcely a shrub. We saw here timber of enormous size—pine and poplar—not very high, but of great diameter, and of dense growth. There was high and good grass everywhere, and a great variety of flowers; a splendid country for botanists to make studies and collections.

13th.—We left this lovely little spot, and, going westward, we followed this dividing range of mountains through forests, crossing brooks and canyons, till after a ride of about twenty-four hours, we came to an old camp of ours on the Savory, where we stopped on the 5th and 6th. Having had a very early breakfast, we felt awful hungry at 4 o'clock, when we came in camp, and we proved that a pound of juicy steak took was not too much. My pipe was lighted then, and I took my rod and brought a nice mess of trout home.

14th.—Our stomachs having been well filled with elk tongue, breaded elk steaks, trout, flapjacks and coffee, we packed up. On the road we fired at great distances at buck-antelope, but did not get any but one. At 2.30 P. M., after about thirty miles ride, we got in camp, took dinner and then went shooting. Frank and Tip killed a black-tailed buck each. Frank's buck was a young one and furnished us very tender meat. I was not lucky enough to get a shot at or even to see a deer, but started in a thicket a grizzly, who, grunting, ran away without letting me have a sight of him, which was, perhaps, the best hunter for me.

15th.—Breakfast 6.30. Bill of fare, kidneys and heart of deer stewed; brain of deer fried; deer liver sauté; breaded elk steaks, flapjacks, coffee. Having gone through this we went for the game again. Tip and I saw several black-tailed bucks, but could not get a shot at them, out going home I killed by mistake a young antelope, which I thought to be a buck. The same evening Jack killed one.

16th.—8 A. M. broke up camp and took a quick and long ride of about twenty miles to Beckman's hay ranch, this place being only fifteen miles from Rawlins. Frank and I, after an hour's rest, concluded to ride the same day to town. We left Beckman's at 4.30 and made these fifteen miles in two hours. We put our horses into the stable, got our letters, and then went to Fred Wolfe's saloon, who refreshed us with delicious, cool Cheyenne lager. After that we directed our steps to the hotel, took our supper and slept the sleep of the just.

17th.—At noon Jack and Tip came in with the train. On next Tuesday, 20th, we start for the second trip north to the Sweetwater and Bighorn Mountains. Very likely we will not have much fishing on this trip. They all say that every stream that runs into North Platte has no trout, while all the streams that run west contain trout in great number. My opinion is that the water of these streams, containing great quantities of lime and alkali (carbonate of soda), are not natural for trout; so I found some streams running into Green River, as one branch of Savory and others, had no trout or any other kind of fish, caused by containing too much lime. Anyhow, I will take my rods with me and try every stream. If parties should like to come out here they can be supplied with all the outfit at Mr. James Fred Wolfe's saloon with horse and wagon, and a good bait. For guides I should advise or direct them to Fred Wolfe, who gave us very valuable information, and knows all the guides around here. It is not necessary at all to engage guides before-hand. Had we known this before, we would have saved several hundred dollars.

Fred Wolfe, as mentioned above, keeps a house of entertainment, where you can be made comfortable for the most part of this time. We will soon have some notes on our next trip.

SOHMANN.

LIGHT GUNS AND LIGHT CHARGES.—Editor Forest and Stream: My experience in loading guns tends to confirm the belief of your correspondent "Canvas-Buck," whose letter appears in FOREST AND STREAM of Aug. 22, that lighter charges than are commonly used are sufficient. At the annual spring shoot of the Monroe County Club this spring the men were handicapped, and as for the lake, we had no better nor had much practice at the trap, I was put at twenty yards, the farthest distance being twenty-four yards. Most of the participants in the match used 10-gauge guns, mine was 12-gauge, weight, 6½ pounds. I charged it with two drachms and a half of common powder and one ounce of No. 10 shot. Four or five us killed our first ten birds "straight," but in shooting-off at five birds all but one of the 10-gauge gun, twenty-four

The Game of Chess.

13—Kt-K3	13—Kt-K3	26—Kt-K3	26—Kt-K3

NOTES BY MR. HAMEL.

- (a) This followed by Q-K5 is now considered the best defence.
- (b) Best: P-K5 is superior.
- (c) All this is according to the books, but the quality of the last move is considered very questionable.
- (d) According to Cook, Black's best play here is Q-K1-B3, followed by B-K5 and Castles.
- (e) A move that looks correct, but which involves the breaking up of Black's P's on the Q side, always an experiment attended with the risk of giving the first player the advantage.
- (f) This looks very much like lost time, which in gambits is always risky, but especially in correspondence. The student should examine the variations arising from Black's P-K4, followed, if B retreats to K3 by B-K3; and if Kt then ch, by K-K2.
- (g) Black apparently cannot save the P, and gets into a precarious position. We consider the success attained by White well deserved, and are pleased with it on account of his boldness in offering the B Gambit. We take this opportunity of observing that gambits in correspondence, though a little risky, turn out mostly, if not always, to the advantage of the better player. The positions requiring do away with the regular plodding for safety, and admit more originality, brilliancy and ingenuity. This is the first gambit in this match—let us hope that some more will follow.
- (h) Black, in trying to save the P, loses a piece. We would have played here B-K3, and we recommend this variation to the study of our readers. By this move it appears to us Black would have got out of his difficulties, and might have turned the tables on his antagonist.
- (i) Too late; all chance of retrieving the game is gone.
- (j) White's finishing moves are in good style.
- (k) Black is compelled to give up his Q to prevent mate in three moves.—*Ayr Argus.*

CURIOUS JOTTINGS.

—The *Harford Times* states that Mrs. Gilbert has a "certain win" in one game, and an advantage in two others in the International Tourney. Mr. Gossp is her opponent. If this be true, and the games were played with that skill which Mr. Gossp is reputed to be the possessor of, then this lady is a much stronger player than has been asserted. Although we have hitherto expressed no opinion on the correspondence play of this lady amateur, we have never the less considered her play of a high order, and should not be surprised should she win the title of "Champion Correspondence Player of America." But few will deny that the claims of correspondence players have not been sufficiently recognized by the chess public, and it occurs to us that now is a proper time to urge them. We therefore call upon all lovers of chess to contribute towards a fund for a grand national correspondence tournament, in which the chief prize is to be a Championship Cup. We appoint John G. Belden, of the *Harford Times*, Treasurer *pro tem.*, and also clothe him with full power and authority to appoint a committee to establish the fund, to govern the tournament, challenges to the winner, the length of time the Championship Cup is to be held before it rests, etc. Should the chess public harden its heart against this suggestion, we doubt not but what some one will donate a Championship Cup. Let us give the ladies an equal chance to secure substantial chess honors.

—The score in the International Tourney now stands: England, 3; America, 7; drawn, 2. Bring up that coach, Belden, at a "right smart" trot, and cross 'em in. We will stroll along in advance, and, if not lost, will meet you at the station.

—Mr. McKim, the communications Secretary of the Am. Chess and Problem Assoc., at last announces that the names of the non-prize winners in the recent tourney of the Association will be published in the *Forest* (this we infer is the only organ of the Association!) "just as soon as space will permit." The broadside recently published in a weekly journal seems to have awakened this derelict official to a sense of his duty. The official discourtesy displayed by Mr. McKim is reprehensible, and he should be called upon to resign his position by the proper authorities.

conduct of the Secretary of the American Chess and Problem Association, the weekly referred to has reached us, and as its Chess Editor reiterates his suspicions, which Mr. McKim alone can authoritatively deny by performing the duties appertaining to the office which he holds, and silence rumors, as well by affording another officer or member of the Association with information, upon a proper and reasonable request, as in this case, we do not now propose to take part in this controversy. We had our say upon the award made in the Centennial Tourney, and it is extremely gratifying to now notice that others also refer to that contest, and intimate that it should also be investigated, "and the real facts brought to light." In order that our readers may fully determine whether we misrepresent our contemporary's intentions in calling public attention to these tourneys, we give the concluding paragraph in the number before us: "The Secretary will have to answer some very tricky questions before he can establish that there were not irregularities in the conduct of the late Tourney, which, when known, will bring a blush of shame to the cheek of every honest American chess player. Let him begin to put his house in order."

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

FOR A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

C. O. B., Titusville, Pa.—Yes, we will be glad to publish scores.

W. P. P., Princeton, Me.—E. G. Blackford, Fulton Market, N. Y., is the address you wish.

M. D., Batavia.—We cannot compare one gun with another, and must respectfully decline answering.

W. D. P., Howardsville, Albemarle Co., Va.—Grayling would not thrive in your region of country.

HIGHLANDS.—Your story of "The Fishing Pole, or the Bamboo Man Bamboozled," is respectfully declined.

G. B. W.—Can you give me the address of a few hunters on the Mississippi River who hunt for a living? We cannot.

D. J. L., South Boston, Mass.—Write to W. F. White, St. F. R. R., Topeka, Kan. for a copy of the "Rocky Mountain Tourist."

J. T. T., Hillsboro, Can.—The best thing on fly tying is the chapter devoted to that subject in Hallock's "Sportsman's Gazetteer."

ONE HUNDRED YARDS, Fishkill Landing.—The fastest time ever made for the 100 yds. dash was done by Stewart in England, whose record was 9½ s.

LOUISVILLE.—H and T traps are so called from the custom of flipping up a coin to determine which trap shall be sprung. H and T mean Heads and Tails. See?

MYSTICORA, Cleveland.—How old are female dogs generally, when they cease breeding? Ans. Time varies, generally after 12 years of age the female does not breed.

ALANTUNGS.—If you will apply to Mr. Albert Koebel, 419 W. 91st St., New York, you probably will get some eggs from him. He has collected cocoons of the silk-worm.

A. T. G., Cincinnati.—For a "rowing machine" of the best pattern address J. M. Laidin & Co., 106 Broadway, N. Y., and mention our name. Price of machine \$10; sent on receipt of money.

E. A., Green Point.—A fine jet-black setter bitch will soon come in heat. No dog of her color here. What would be the most suitable color to cross her with? Ans. Black and tan, black and white, or red.

C. A. P., Columbus.—How would it affect patents and penetration to create paper shells between powder and shot? Ans. It would not do any good, possibly harm. One thing it would give a first-class record.

H. A. A., Brooklyn.—For complete North Woods camping outfit see "Wallace's Guide to the Adirondacks," pages 263 to 269. The directions there given are very comprehensive. We can send you the book for \$2.

L. W. H.—A squid is an octopus or deep-sea—the long-armed creature which abounds in the seas. It is found of all sizes, from an inch or two long to 40 and 50 ft. It is the favorite food of the cod and of all other fish. Found all along our coast.

F. R. S., Boston.—A tent 63 feet will accommodate two campers. The larger it is the more comfortable, however. To cook by your camp you can form a rest by placing two or three large stones together, or two forked sticks into the ground and suspend your kettle from a cross piece.

W. F. R., Cincinnati.—English setter, five months old, has sores all over his head and eyes; hair coming out of the affected parts; slight cough; discharging at the eyes; coat rough, and smells bad; no appetite. My greyhound died this morning of the same disease. Ans. Has mange, and exhibits early symptoms of distemper.

S. E., New Orleans.—My setter is frequently taken with tremendous colic, and whenever I take him out hunting falls in fits. He staggers as if afraid of something, and is then seized with spasms. Ans. He may be suffering from an obstinate constipation. Give him small doses of sulphur three or four times a week, and a dose of castor oil on the alternate days.

H. L., Versailles, Mo.—Please give name of some good duck shooting resort, accessible from St. Louis by boat? Ans. You will find in the neighborhood of La Grange, Mo., and Lima, Ill., many lakes, ponds, sloughs, etc., where there are great quantities of all kinds of wild fowl and various other game, and good fishing too. You will have no difficulty in finding good board at the farm-houses, although we are unable to give you any names.

RIFLE, Springfield, Ill.—Tell me the price of Oriental Falcon Ducking Powder? 2. Also the price of Creedmoor brand of Orange Powder? 3. What is your opinion of inclosed style of target, to be used at long range? 4. Will the American Team for 1894 shoot at Creedmoor in September? Ans. 1. \$1 per pound. 2. 75 cents. 3. A good idea, but has been sufficiently suggested. 4. Not yet decided.

C. H., Peoria, Ill.—Is the Winchester rifle—model of 1873, 21in. long—a suitable arm for target practice at short range, say not above 400 yds. or would the model of 1875, 21in. long, or any other make of rifle be more adapted for that purpose? 2. Where can I buy iron targets of different descriptions? Ans. 1. Both would do, but would prefer the latter. 2. Address James A. Dimond, 211 W. 32d St., City.

A. G. K., New York.—For an Adirondack tour you will find very satisfactory information in "Wallace's Guide to the Adirondacks" and in Hallock's "Sportsman's Gazetteer." Guides charge \$2.50 and \$3 per day. There are several different routes of entry to the Woods, and since we know which one you propose to take, we cannot give you definite information. If you have no plan, go to A. H. Fuller's, Mescham Lake.

T. E. L. B., Ames, Iowa.—My setter dog, eight months old, when running suddenly stops and listens, turns his head to one side, then to the other, as if he heard some sound close to him; then giving his head a shake, he runs on, to repeat the same pantomime a few rods further. I have examined his ears, and washed them, but could detect nothing wrong with them, when a number of small running scores appeared on the outside of the base of the ear. Otherwise his health is perfect. Ans. Perhaps has canker of the ear.

A. M. G., Plainfield, N. J.—Taxidermy: "Brown's Manual," \$1 "Taxidermy Manual," \$1.50. "Tide shooting: "Wiggin's Manual," \$1. "Tide shooting: "Terry's Manual on Bird Shooting," \$1. "Tide shooting: "Hildersleeve on the Rifle," \$1. "Best work on boat building is Nelson's "Boat Building for Amateurs," for small yachts, "Empire Manual." Can procure either for you. First cost \$1.50, later about \$10. For canoees see "Canoe and Plying Boat," published by the Harpers and "Canoeing in Kananuckia," same publishers.

B. M. E., Hancock.—The question of ribs on a gun, and how high they should rise above barrels at the breech, is a very much mooted point. Old guns do not show it. About twenty years ago it commenced to be in favor. We do not see any good reason for having a high ridge between the barrels. Do not think it would affect shooting much in any way. A glass ball should be thrown some 30 ft. For a 12 bore, at 50 yds., 2-3 of the counted pellets is a maximum target. As to putting a sand in more together, so as to make them equal, we think it is not good. No bad shock shown, but you can't get it when you jumble up two broods of dogs. 2. If judges declare the boat race a dead heat and referee concurs, as we understand he did from your letter, the result must be declared a draw and all bets are off, each party having his money returned in full, neither party winning.

SUNSHINE, Norfolk, I.—I have a pup three and a half months old, the mother a thoroughbred pointer, the father a pure English setter, all points perfect except tail which is inclined to curl. Does that defect denote any bad stock? I raised the mother and know she has never bred from any but pure breeds. Would you advise me to dock his tail? He pointed his first quail last Sunday. 2. In boat racing when judges decide a dead heat and the referee says he could not tell which boat crossed the score first, how should the race be decided and bet thereon? Ans. Can give no advice about such mixed blood. You have a drop of setter. Don't cut his tail. We would say it would do no good. No bad shock shown, but you can't get it when you jumble up two broods of dogs. 2. If judges declare the boat race a dead heat and referee concurs, as we understand he did from your letter, the result must be declared a draw and all bets are off, each party having his money returned in full, neither party winning.

M. J. D., Bay Ridge.—We have record of three Mystics. One is a steam-yacht built by Malory, and the property of Mr. R. S. Chapin; she is 72ft. on water line. The second is a small sloop belonging to the International Yacht Club of Detroit, and the third is the schooner you refer to. She was built by Lennox, of Brooklyn, in either 1857 or 1861, and slooped in 1860 and 1873. Owned some time ago by Mr. W. G. Creamer, and at present by Vice-Commodore Hall, of the Brooklyn Yacht Club. During her alterations she was considerably lengthened, and from this probably arises your supposition that there is a large and small schooner in these waters by that name. At least, we know of only Mr. Hall's schooner Mystic. If there is a small schooner by that name also, she certainly does not belong to any recognized yacht club, and has made very little noise in the world, or we should know about her. Conn. Hall's Mystic is 61ft. 3in. on water line, and 80 tons N. M.

G. D. K., Carlisle.—About three years ago our stream here was stocked with 400 black bass which averaged about a pound in weight; no fishing was allowed until this summer. We are now taking five baskets, some of the fish weighing as high as two and a half pounds. Are these large ones some of the original stock? What size would a bass a year old be? Is it true that black fish are never absent from the spawning bed at the same time? Do they raise 30 per cent. more of their young than any other fish? Ans. The black bass you are catching are undoubtedly the fish you have preserved. The growth of two and a half pounds in three years is by no means extraordinary. We have heard of a four pound fish raised in four years. But very possibly your original fish were older than a year. It is true that the parent fish do not abandon their nest and so a larger proportion of fish can be raised than from most other species. For particular streams the *micropterus* is among the best of fish; not only game, but excellent food.

H. B. K., Lake Mendota.—The *cinchona rubra* cure for drunkenness as some time since given by Dr. D'Unger in the Chicago *Tribune*, is vouched for by that physician. We have never seen any trial of it. Dr. D'Unger says: "The commercial crown bark (Socra) comes in cones, and in each of these is mixed bark. Have the small quills picked out. They are ten to fifteen inches long, sometimes spirally-shaped. Any of the importing houses who get bark from England or France (where the most of this particular variety is first shipped) can procure it, but will charge from \$2 to \$5 per pound for it. The manner in which I concoct the cinchona that I use in my practice is to make a pint out of one pound. I get the bark in the "quill" form moist, and pulverize it just before the displacing operation is begun. I cook the bark with water, and keep it over night, or for two or three hours, saturated, afterward using dilute alcohol, filtering slowly until a pint is obtained. If the tincture does not look a very dark reddish-brown, I re-distill it over the fire. The dose I administer is usually a teaspoonful three or four times a day, or as often as the patient craves a drink. In some cases, when the party is strong and vigorous, and with the nervous system has not been too much shattered, I increase the dose to two, and sometimes three, teaspoonfuls, and very rarely do I use anything else, except it may be where there is great restlessness and insomnia, then I administer four doses (ten to twenty grains) of the bromide of potassium."

CARTRIDGE, Red Cloud Agency, D. T.—I have a .45 cal. Sharps sporting rifle, weighs 10½ lbs., 30in. barrel; using Government cartridge, .45 cal., 55 and 70 yds. powder—weight of bullet, 405 grs. Which cartridge is the most effective on game up to 350 yds.? Will not the 70-grain cartridge have a flatter trajectory than the 55-grain, thereby increasing the chance of striking the object? But in case of either one striking, which has the most power to disable? I find, in shooting at a common pine box, that the 70-grain cartridge has a flatter trajectory, and nearly as good a shot. The 55-grain makes a clean hole on entrance, but a jagged, and from two to three times as large on leaving (going out) as the 70. (Understand the box to be 3 ft. square, made of 1in. pine, with 3in. space between, giving the penetration at 2in., the second being the one in which the bullet leaves the ragged hole.) What is the cause? Ans. The heavier loaded cartridge would, theoretically, have the flatter trajectory, but at 250 yds. the difference would be immaterial. Your second question involves a long train of reasons to make an answer plain. Heavy charges of powder, as in the Express rifle, will hit bullets, give the greatest impact, and produce the most terrific effect on game. Proportionate charges—that is, of ball to powder—giving big velocities, when the ball enters an animal, it passes through but little changed in form. Decrease the powder and keep the weight of the ball the same, and a large, tearing wound is made. In the Express bullet it is not only the heavy charge of powder and the light ball which makes a projectile spread, but the construction of the ball—its hollow core—also the change in the form. If we were to load with cartridges you load with, we believe that the lighter load would be better to drop game than the bigger one. Now as to the reason: You can shoot a ball through a pane of glass and not jar the glass, while a strong wind would jar it.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

DOCTORS IN THE FIELD.—A busy, hard-working class of men are our physicians. But no one knows better than they do the hygienic value of a respite from the routine of duties and from the cares and anxieties which are the most wearying part of the profession. They fully appreciate the good that comes from a tramp after the birds and the fishes, or a simple jaunt to the pure air of the mountains and prairies. Many of our most charming sketches of sporting travel and adventure are contributed by the doctors. They know how to bag a good amount of game, to return with pleasing evidences of angling skill, and not infrequently their names appear at the head of the rifle and shot-gun scores. If more men and women followed their example, instead of drawing the cork of the medicine bottles, the doctors would have more time to play.

TO AN EDITOR TURNED SHOWMAN.—Dear Sir: In your issue of Sunday, September 8, you have a "Menagerie" column, in which the antics of sundry strange and curious beasts make up a great moral show, which you claim is harmless to the gazing multitude. You will pardon us for intimating that several of the most wonderful creatures were once our own. We claim the credit of having introduced them to the public. This credit you deny us. Put the tags on the cages, Mr. Showman; the people want to know where the specimens are from.

U. S. SHIP SARATOGA.—We had the pleasure of a visit from Capt. W. D. Evans, commanding U. S. ship *Saratoga*, which arrived at this port on Thursday last. Captain Evans was anxious to learn about the fate of the Carolina rail, which had been caught by him some 350 miles at sea, and which our readers may remember had been confided to our care. We were happy to inform Captain Evans that the bird was doing quite well. This officer is anxious that the navy should stand in line with the army and the citizen soldiers at the coming International Military Match to be held this fall. We trust to be able to arrange this business, and are hopeful that "the boys in blue" will soon make their first appearance at Creedmoor.

FOR THE FEVER STRICKEN CITIES OF THE SOUTH.

OUR appeal for funds has been so far most generously replied to. On Sept. 6th we turned over to Mayor Ely \$172, and on September 7th, \$143. This last contribution was made up as follows:

R. B. Roosevelt.....	\$100	Kimball, Gaultier & Co.....	\$5
Amateur Rifle Club.....	25	J. B. Crook.....	3
Centennial Rifle Club.....	10	H. C. W.....	5

This with the former amount made a total of \$315. We have to-day sent to His Honor, Mayor Ely, the following amounts:

A Lady (through Messrs. Abbey & Imbrie).....	\$5	J. R. Broadway.....	\$5
Conroy, Bisset & Malton.....	\$10	T. Williamson, Leesburg, Va.....	1
Basil, Bound Brook, N. J.....	5		

Total amount sent by sportsmen's contribution is, to-day, \$347.

The generous heart of the country has responded so far nobly, but alas! the demands made are still very great. Much more money is wanted. It must be borne in mind that when the heads of families are stricken by death it is the survivors who suffer. The misery and privation in the South is indescribable. Will not all our friends contribute? We do not care how or where they send their money, so that it is devoted to the cause of suffering humanity.

INTERNATIONAL MATCH OF 1878.

SOME of the members of the old team are of opinion that the riflemen of this country are "spoiling for a match," when it is proposed to carry out the programme laid down and shoot over the ranges for the "Palma," even in the absence of any competing team. One of our contemporaries thinks that no thoughtful American, with the welfare of rifle shooting and of true sportsmanship at heart, would countenance the idea of a team claiming the International trophy without obtaining it in a manly way in an honorable contest. Very true all that is, but when it is pointed out that a "walk-over" or contest without the presence of a competing team is such a claim we take issue on behalf of the National Rifle Association and the real interests of rifle practice. It may be, first of all, admitted that the winning of the match by a team of 1878 will put the team of 1877 out of the way and take from it any actual control, and it may be this half-dozen honored experts are referred to by our esteemed contemporary when it says that it "echoes the sentiments of that body of marksmen who have labored and contributed in and out of season and have secured a supremacy as men and marksmen that may well be emulated." Their supremacy as men we leave to the general public to decide; but as marksmen there are many who emulate their supremacy, and, judging from the competition scores recently published in our pages, it certainly looks as though their present supremacy was to be swept away very effectively. It is both ungenerous and unjust to throw down a sweeping slur against the competitors for places because no official scorers were provided, and to speak of the record as of no value. It is often bandied about at Creedmoor that So-and-Sos big record was doubtful, because he kept his own score; but in an experience of five years on the National Rifle Association range we can say that no direct attempt to mislead by false entries has ever been detected among the long-range men. If every man is to be judged a rogue until he proves to be honest, such an accusation might have a general ground, but the very motive the long-range men have for participating in their sport, and the foolishness of attempting to get a reputation as a shot on false scores, would effectually sweep away any such notion, even were the personal characters of the men visiting Creedmoor a sufficient guarantee of the scores turned in. Certain it is that those who will by hint and nod try to discredit another's score never come forward and make their charges openly, where effective punishment would follow their proof. But enough of that. There is no evidence, not even the shadow of a doubt, against the scores credited to the team of 1878, and for the high average shown, those gentlemen deserve only praise and commendation. If they take no further step, they have shown that America is ready to answer with a long-range team at any time.

It now remains to consider the policy of having a match, or rather a shoot, when no competitor appears. It is nonsense to apply the maxim that, "You cannot win where you cannot lose." To bet on a sure thing is dishonest; but the principle of walk-overs to establish claims is as old as the hills, and no one should know this better than a born and bred horse man.

The fact of a walk-over match in 1878 in nowise affects future contests; or, if it has any effect, it helps by establishing a precedent, as our chances for keeping the "Palma" on this side the ocean is much stronger if we can put a team through the paces on the old years, when foreign teams find it either impolitic or inexpedient to appear on our ranges; and then to the body of riflemen here the International score record is a guide to what is doing in the best long-range shooting circles.

If these men are willing to give their time and effort to fill the gap of an empty year, and to give an impetus to home practice by their example, it is an ill-natured critic indeed who would say them nay, and it is as far as can be from the

truth, besides presumptuous to a high degree to say that "the cordially, fairness, manliness and dignity which have characterized all previous International rifle contests will not be sustained in the estimation of foreign competitors, or by our own more thoughtful countrymen, by any such imaginary walk-over match and claim of victory."

Suppose that the Elcio Shield contest should for any reason be left to a single country, would not the team of that section go over the course and claim the record and the trophy for the year? There is something to lose by a neglect to contest for the "Palma." There is the ownership of the trophy, there is the record, and there is as well the succession. If the team men of 1877 were desirous of keeping themselves in the posts as custodians of the trophy and possible controllers of the next match, the competitions for places were open, and they could have perpetuated themselves as the champion riflemen by earning and holding the title, and, losing it, nothing befits them in their "supremacy as men and marksmen" than a quiet retirement.

None will deny that for comparative uses with the figures of other years the scores made by a team shooting without any rivalry on adjoining targets is as good as could be. To be sure there is a loss of the notoriety, the crowds and general confusion which attends the spectacle of two or more teams fighting side by side for the supremacy. But boats go over courses to beat time. Courses are walked over. Horses compete, and why not riflemen exert themselves to distance anything ever before put down on the cards. Such is the feat which the team of 1878 have set before themselves. It is to show the world that, do as they may, foreign riflemen will always find in America a squad able to go a little better. If this be "jockeying," then have Messrs. Jackson, Rathbone and their fellows set themselves to a wicked piece of business; but as there is no petty trifle of money to be picked up as last year, and but little newspaper notoriety, it becomes, if there ever was such a match, one for pure glory and honor. The men are amateurs in the sense which no American team has yet been. In shooting over the ranges without the accompaniment of a visiting team the men will be doing nothing out of the common, nothing that it is not perfectly proper should be done, and if they make (as everything leads us to suppose they will) a rattling high score, they will have legitimately earned the right to inscribe "America" on the wreath of 1878.

THE RIGHT IN FISH PONDS.

THE case of Edward H. Seaman against Luther B. Lee and Geo. W. Lee is one of particular interest, and which came to our notice some years ago. We may say, at that time, in 1873-74, when the matter was brought before us by Mr. Seaman for advice, trout culture was commencing to take a definite form, though the laws protecting fish ponds were not yet well determined. The plaintiff, Mr. E. H. Seaman, had built in 1873, at considerable expense, trout ponds, situated near the town of Hempstead, in Queens County, New York, for the purpose of raising fish. These ponds were fed by a brook and natural spring, the latter being in the ponds themselves. In 1874 Luther B. Lee and Geo. W. Lee dug a ditch from their house, on their lands adjoining the lands of Mr. Seaman, flowing through some ground owned by William S. Hicks, so that it entered upon the land of the plaintiff. This ditch, so the complaint stated, "carried the water and drainage of the Lee house and other deleterious, noxious, wholesome and pernicious substances and fluids, with refuse matter, resulting from the washing of oil barrels and from the manufacture of varnishes, into the fish ponds owned by Mr. Seaman, from whence arose the destruction of his trout. The suit was brought on the 13th of July, 1874; the trial commenced in September, 1875, H. W. Onderdonk, Esq., being attorney for the plaintiff, Messrs. Morris and Pearsall for the defendants, the referee being R. Ingraham, Esq. The suit was concluded in July, 1876, in favor of the plaintiff. From this decision an appeal was taken to the General Term of the second department, when the judgment of the referee was unanimously confirmed. From this decision, owing to lapse of time, no appeal can now be taken.

Some very interesting points were brought up as evidence by the plaintiff. The appearance of a greasy scum on the surface of the pond seems to have had almost an immediate effect upon the fish. The growth of coniferia seemed checked, and it disappeared. In fact, it becomes quite apparent by reading the testimony, that no sooner had the drain been run into the ponds by the Messrs. Lee than the fish commenced to suffer. Mr. Seaman having secured the services of Mr. James Hyatt, a practical chemist, samples of the water from the pond were taken, and with proper tests the presence of impurities in abnormal quantity was found in the ponds. Some experiments were made by Mr. Hyatt, to determine the quantity of soap in water which would kill fish. The evidence given by Mr. W. H. Furman, the well known fish culturist, is quite noticeable, in regard to impurities in fish ponds. In his deposition Mr. Furman states: "Impurities affect fish, but it depends on the kind. They will live in impure water, but can't grow. Could not tell what an oily scum in the water would do, unless I knew what it was. Soap will kill fish. If the surface was covered with oil or grease from soap it would kill the fish. I think any kind of soap will kill fish; soda and oil would either of them kill trout. Am acquainted with the plant coniferia; it resembles cotton, only it is green. It is what is called frog spittle, that

grows from the bottom and bears seed. I have known it to grow in the purest spring water. I think, if it indicates anything, it would indicate pure water; grows very rapidly if the water is clear and pure. This is beneficial as furnishing shade for the fish."

The efforts of the lawyers for the defence made very little attempt to evade the fact that their clients did run their drain into the plaintiff's ponds. What they tried to show was that Mr. Seaman's fish died because his ponds were not sufficiently shaded, or that if impurities arose in the plaintiff's ponds, it was caused by cattle. Mr. Seaman had a very strong case, though, as it may be seen by a careful reading of the law paper—some 100 pages—that a good deal of testimony on both sides was necessary in order to prove some very self-evident facts.

We must congratulate Mr. Seaman on having won his case, which was undoubtedly one of principle and in defence of the rights of fish culture. In fact, Seaman vs. Lee is a test case, and may be considered as establishing the proper precedent in such matters.

RENTING GROUNDS FOR SHOOTING.

IN a late London *Spectator*, an article on the Scotch moors is found, which, as it gives an *aperçu* of the methods employed there, may be novel to many of us. Sixty years ago Scotland, though not a *terra incognita*, seems to have been discovered for English sportsmen by Sir Walter Scott. If the *Spectator* is to be credited, it was the Wizard of the North who almost invented grouse shooting. It was the Lady of the Lake which made Scotland fashionable. Before that time the stretches of purple heather and their wealth of moor-fowl were unknown to the Sassenach. Then came the demand for peat-flavored whisky and Highland tartans, and money was made by moor-letting. Nowadays extensive moors can be hired for about fifteen pence per acre. Their rental is, of course, but a portion of the outlay. Expenses of travel have to be added, and the many comforts and conveniences the sportsman requires increases the cost. It is not unusual to rent for a couple of months as much as eight or ten thousand acres of land at a cost of £500. An idea has gone apparently abroad in England, since the sportsmen sell their game, that "a good thing" is made out of the poulticers' account. Some such sales from Leadenhall Market are given, which show that from a particular moor, where 438 birds were turned in, the gross receipts were £47 17s. 11d., or 2s. 1d. per bird. Estimating then a rental and expenses at £630, it would require the marketing of 4,000 brace of grouse in order to make up the disbursements. In the case where the person renting a moor would assume the character of the pot-hunter, the keen desire to make both ends meet might result in the utter killing of every bird on the land. In order to prevent this, canny "grouse lairds" sometimes only rent on the condition of furnishing a keeper, who may check the greed of the lessee. In old times, when driving was not in use, such havoc among the birds was impossible. Beating over the grounds, then, with the muzzle-loader, with good dogs, making some twenty miles a day, for four days in the week, the sportsman's bag would average about a brace of birds per mile gone over.

It is the sensible and economic idea embodied in this article which strikes us. What possible degradation can there be in disposing of the birds which a man cannot eat or give away? The other day passing through Fulton Market, we noticed some of the finest striped bass we had ever seen. On inquiring about them, we were told the fish came every now and then from some well-known fishing clubs to the eastward, and, from the excellence of the fish, they always commanded a high price. The time will come when gentlemen sportsmen, desirous of chicken-shooting, will be glad to hire some thousands of acres of good ground from the Western farmers. In fact we know now that this is the case. That sportsmen may sell such game as they do not use, has this English precedent. Of course the debit and credit account no one is so mercenary as to wish to have exactly balanced. The grand surplus of profit is in the pleasure and health such sport gives. If well-regulated leases were made by sportsmen and farmers, covering the time, say of 100 days, with proper restrictions as to the numbers of guns, dogs and close days in the week, we see that there would accrue to all parties a great deal of solid gain and comfort. One thing which is quite positive is that regulations of the character we had described, suggested by the *Spectator*, would tend very much to make our game laws more particularly observed. The farmers would be the parties most interested.

SHIFTING BALLAST.

THE abominable nuisance of shifting ballast is still in vogue. The racing season about to draw to a close has evinced no amelioration among that large class of yachtsmen given to match sailing in jib-and-mainsail boats. This fact is to be deplored. As long as sandbags decide the day, just so long will we perpetuate the folly of building smooth-water racing machines, instead of able little craft that can serve as cruisers as well as racers, that can give enjoyment and instruction equally as much as lead to success in rivalry on only one of the salient points of the sport. But two clubs in the neighborhood of New York have this season taken steps in the right direction for the advancement of legitimate yacht racing. The members of the Central Hudson Yacht Club sailed several matches with "fixed ballast," and the success-

ful issue of these should have been quite enough to have led to the abolishing of the sandbag infliction, imposed upon the subsequent open regatta of Newburgh; but not the slightest attempt was made by those in authority to do away with a crying evil, which bears so heavily on all followers of the sport, upon amateur sailors or machine jockeys alike. What applies to the Newburgh regatta holds good for a dozen others sailed in metropolitan waters. A small, flat, skimming dish, huge spars, bowsprit as long as the yacht itself, boom still longer, and canvas enough to drive a gas tank through the water; then pile up your sand bags a dozen deep, and climb out to windward; win, or inconspicuously capsize—that is the yacht racing of the present day! When may we hope to see a change for the better; when will there be a prospect of substituting *bona fide* yachts of small dimensions for the veriest sailing machines that man ever devised? All praise to the efforts of the Central Hudson and Monmouth Beach yacht clubs to at last break through the baneful habit of shifting ballast, and sailing matches with the floor down over all weight, and limiting crews to rational numbers—the only two that have in this vicinity ventured upon an innovation vital to the future design of our small yachts, and to the development of real seamanship. All praise to the Eastern clubs—the Dorchester, Nahasset and Beverly most conspicuous among them—which have long ago done away with the pernicious custom of a store-full of dry goods dragging a mountain of rubbish through the water in a big saucepan.

QUESTIONS AND ANSWERS.

A CORRESPONDENT finds fault with many readers for the questions they ask us. He is apparently amazed at the simplicity of the queries. "Reebuck" forgets that the *FOREST AND STREAM* and *ROD AND GUN* is read by young and old—by those to whom life is just beginning, and by those older and more experienced. If we have replied for the thousandth time that a 10-bore is adapted to this kind of shooting and a 12-bore to another kind, we are quite willing to keep on answering the same question. We expect to print the exact load for a gun as long as anybody is in ignorance or a gun is shot. Why should we lose patience? Among the numerous easy questions and answers which "Reebuck" smiles at, there comes occasionally one which puts us to our mettle. The questions sent us are often very suggestive, and have been the cause of making us study up many a doubtful point. We have one now on hand which, in its development, will possibly give quite novel points in rifle shooting. It speaks well, we think, of the intelligence of the audience we cater to, that so many leading questions are asked of us. If we wished to extend the limits of our column by introducing into it the settlement of wagers on games of cards, "Reebuck" might find fault with us. Our readers seem to appreciate our efforts to satisfy a natural thirst for information, and few weeks pass that we are not thanked for curing dogs, or settling doubtful points as to the make of guns or the best ways of rendering them effective. We believe that fishermen throughout the country have had the advantage of most valuable information derived from our column of Questions and Answers. Of course, we wince at times—when sixteen questions, for instance, are sent to us in one string, or when a man in Boston wants to know who lives next door to him. But it is our business to take trouble, and to fulfill as well as we can the task we have accepted. If, then, as our correspondent amusingly asks, some one were to propose to us the following questions: "1. What is the proper charge for my gun to kill cats on my back fence by moonlight? 2. Which makes the best gun barrel, Jersey elder or Florida cane?" we would refer the first to Mr. Borgh and the second to "Reebuck" himself. As it is, send in your questions and you shall be answered to the best of our abilities.

[FROM OUR OWN CORRESPONDENT]

THE LOVELY VALE OF RAPIDAN.

RAPIDAN, Va., Aug. 13, 1878.

I WRITE to you from the hospitable residence of Mr. P. B. Jones, Jr., a lover of horses and an ardent sportsman. Unfortunately this valley, one of the loveliest and most fertile in all Virginia, has been so denuded by the ravages of war as to break up the haunts of the game with which it once abounded. Just at this time plover may be found in considerable numbers just across the river in Culpeper. An invitation to a morning's sport for this delicious bird, given last Saturday to my host, had to be declined in consequence of the extremely hot weather.

Partridges, squirrel, hares and such small fry abound in season, and upon Clark's Mountain, a mile or two off, catamount have been killed within the last three years. In the Rapidan River, which flows around this magnificent farm, but few fish worth catching are found; but higher up, on one of the tributaries of the Rapidan—the Robison River—trout are plentiful. A troutling party will leave this place to-morrow or the day after. They go to a new mineral water resort, which has become recently so famous as to fill the barns of the neighbors with visitors, there being as yet no hotel to accommodate them.

Upon the fine estates hereabouts blooded horses and cattle may be found, but not in numbers as of yore, and of scarcely importance enough, except in a few instances, to be mentioned by name. Land is high-priced, that in the immediate vicinity of Rapidan Station bringing \$100 the single acre, while the

adjacent farms command from \$30 to \$60 the acre. Crop this year are exceptionally good, the yield of wheat rising almost to the maximum of ante-bellum times, while the corn promises to overflow all the bins and houses that the farmers possess. Much of it will have to be left in the field.

Gentlemen of wealth from Baltimore and New Orleans have purchased large farms here and erected handsome residences on them. A few Northern men have also settled here, and others will follow when the times improve. Population, already thick, will become denser, and in after years the Rapidan Valley, famous for its beauty, its fertility, and its historic interest, will rival New Jersey or Massachusetts in wealth and comfort and all the delights of rural life.

I have not said a word about the magnificent scenery around Rapidan, simply because it utterly transcends my powers of description.

[FROM A STAFF CORRESPONDENT.]

ROCKY MOUNTAIN WANDERINGS. No. 3.

IN my last letter I detailed to you very briefly some of the incidents of my stay at Jones' Rancho on the Medicine Bow River and my short hunt near the base of Elk Mountain. Since my return from that country it has been the scene of a most shocking tragedy in which two good and brave men were foully murdered by a gang of train robbers.

On the afternoon of August 17 a diabolical plot to wreck and rob the western-bound passenger train on the U. P. R. R. near Medicine Bow, was frustrated by the vigilance of the section foreman, and attempts were at once made to follow and capture the perpetrators of the outrage. The robbers had removed the straps and spikes from a rail just east of a short bridge which spans a dry gulch between Coues and Medicine Bow, and had attached to each end of the rail pieces of stout wire. The rail was left in position so that the engineer of the approaching train could not see that anything was wrong, and the purpose of the desperadoes was evidently to draw the rail from its position just as the engine reached it and thus hurl the train, with its living freight, into the gulch, inevitably destroying two-thirds of the passengers. In the confusion which would naturally ensue it would have been an easy matter to slaughter, if necessary, the remaining passengers, and in any event the express and mail cars could have been robbed, and the valuables of the dead and wounded secured. For ingenuity and utterly reckless disregard of human life this outrage could scarcely have been excelled. Little wonder that demons who could develop such a plan would not stick at the murder of two men whom they had in their power.

On the morning of August 18 some citizens of Medicine Bow went to the scene of the attempted robbery, found the tracks of eight horses and followed the trail for a short distance. It led in the direction of Elk Mountain and the citizens, not feeling themselves strong enough to cope with the outlaws, returned to the town and sent out two men, Robert Widdowfield, a deputy sheriff, and Tip Vincent, who were to follow the trail carefully and, after seeing in what direction it led, to return to Medicine Bow and report. The two men started out on Monday morning, and that afternoon a party of surveyors, at work on the foothills of the mountains, saw them enter Rattlesnake canyon which lies between Elk Mountain and Code's Mountain. Shortly after the two men disappeared into the gorge, the surveyors heard brisk firing for a few moments and, as they were ignorant of what had taken place at the railroad, they supposed that the travelers had found some game. Shortly afterwards seven mounted men, one of them leading an extra horse, were seen to emerge from the canyon and ride off. From that time until three days ago nothing was heard of Widdowfield and Vincent; then a party of twenty mounted men who came down from Rawlins found their bodies in the canyon riddled with bullets and covered with boughs, in lieu of burial. Vincent was about one hundred and fifty yards further up the canyon than his companion and was shot twice through the head, twice through the heart and twice in the abdomen; Widdowfield was shot in four places. It seems altogether probable that the two men, not suspecting that the outlaws had stopped in the canyon, had been following up the old trail and, having been seen by the scout posted by the gang, were ambushed and slaughtered without the opportunity of firing a shot having been given. Their bodies were brought into Carbon for burial.

It is hardly necessary to say that this dreadful act has awakened the greatest indignation throughout this whole country, and should the robbers be taken their shrift would probably be a short one. Both Widdowfield and Vincent were highly esteemed by all who knew them; the former was a quiet, gentlemanly person of undoubted courage and great popularity. He had assisted last May in capturing a gang of train robbers. Vincent was a frontiersman of the better stamp, brave, a good fellow and ready to take part in anything that turned up. Perhaps it was just as well that we left Elk Mountain when we did.

It was with feelings of genuine regret that we left Mr. Jones' hospitable rancho, and once more turned our faces toward Medicine Bow, from which place we propose at once to start for the Freeze Out Mountains. Our party is here augmented by one, Mr. Phillips, the courteous and efficient agent of the U. P. road at Medicine Bow, to whose kindness we are indebted for many favors. Here we engaged a driver, wagon and team of mules to transport ourselves and our camp outfit to our destination and the hills.

On Tuesday mor we pulled out from the Bow. Ou

journey for the first twenty miles was slow and monotonous for the road runs through a desolate sage brush prairie which offers nothing to interest one, save when, occasionally, a flock of sage grouse would rise from the roadside, or a frightened jackass rabbit, startled by the rattle of the wagon, would spring from his form beneath the sage and skurry away over the prairie. Then, too, our mules were young and only half broken, and often in trying to surmount some steep rise in the prairie they would stop and let the wagon back down the hill to the level. On such occasions all hands would spring from their seats and, putting their shoulders to the wheel, would assist the wretched mules to drag the load to the top of the hill. Six or eight miles beyond the Twelve Mile crossing of the Medicine Bow River we turned sharply to the right and proceeded up a canyon, on either side of which rose high walls; those on the right were of bare brick-red Triassic clay, while to the left the yellow Cretaceous sandstones, dotted here and there with dark green junipers, attained an altitude of six or eight hundred feet and were almost vertical. The contrast was fine.

A few miles brought us to a high prairie, encircled on all sides by mountains, and over this we continued our way in a north-westerly direction, and about four o'clock in the afternoon reached a little brook rising from some beautiful springs, near which we determined to camp. The location was a charming one. The almost omnipresent sage had here given place to a rich growth of grass in which our mules relished; the mountains were on all sides and, though without snow, were rugged and very grand. Some of them were thickly clothed with living pine, spruce and fir, while others had been burned over and fairly bristled with dead timber. Just before reaching camp we came upon a little valley scarcely three hundred yards across, in which several antelope were lying down. As we are without fresh meat it is important that one of them should be killed, but the noise of the wagon startles them, and before we can leap to the ground they are off like the wind. Half a dozen shots, fired at long range, fail to stop them, and in a moment they are out of sight.

On reaching our camping ground the tent is pitched and supper prepared, and then we set off to explore the country for "sign." About the little spring from which flows the clear, cold water which forms our brook are numerous tracks of deer, elk and antelope, some of them fresh, but the greater number old. It is evident that there has been plenty of game here, but whether it still remains in the country is doubtful. We separate and take different paths into the mountains, first agreeing, for fear that we should frighten the game, not to shoot at anything but bull elk, or bighorn. On meeting again after dark Reed reports having seen two mule-deer fawns and a cow elk with calves; Mr. Phillips saw a cow elk, while my only discovery was an old buck antelope. Some game there is in the neighborhood, but we determine to push on still further into the hills where it is more abundant. Still we must have some meat and so next morning we all start out on foot again, leaving Tom, our teamster, with orders to be ready to move at ten o'clock. Sunrise finds Mr. Phillips and myself, glasses in hand, seated on a lofty peak of the hills scrutinizing with the utmost care the surrounding country, especially the creek valleys and timber ravines, and we have not been watching long before we are rewarded by seeing three deer emerge from a ravine about a mile distant and commence to feed among the underbrush in the valley below. After observing them for some time and feeling sure from their actions that they would not move from that spot we made a wide circuit, passing over the mountain, and reaching the head of the valley in which the deer were feeding. Here we found a precipice from which we could obtain a view of the whole brook. The face of the bluff was vertical, or overhanging, and from two little horseshoe bends in it fell cascades of the purest cold water. The rivulets which supplied these falls arose only a few feet from the edge of the bluffs and the springs flowing fresh and clear from the Triassic rock were beautified by great masses of dark green moss and overhung by luxuriant willows. The narrow valleys into which these streams fell united almost at once and their commingled currents flowed through a deep canyon bounded on the west by a vertical wall of deep red rock, and on the east by a steep bluff gray with sage brush. The valley itself was of the softest green and the grass stood waist high. Every few yards there were little copes of willows which would afford admirable cover for deer and elk.

After a short rest and a draught of these living waters we proceeded to look for a place to descend to the bed of the stream. Just beyond the springs we walked up to a fine brood of sage grouse, and on passing over the little ridge from which the springs rose, we came upon three small coyotes, about two-thirds grown, trotting unconcernedly along in the sun, their tongues lolling out of their mouths, and looking for all the world like so many our puppies. A sharp whistle caused them to spring wildly into the air; glance hurriedly from side to side, and then start off toward the hills, anxiously looking back over their shoulders every two or three jumps. Their mingled surprise, terror and curiosity were very comical. Having found a place where the bluffs could be descended, we proceeded down the valley until we reached the spot where we had left the deer feeding. I was ahead, and was walking carefully along, when I saw the head of a large buck through a matted mass of undergrowth, by which the bottom was here choked. I could not shoot through this with any hope of hitting my game, and feeling sure that the deer would run to the bluffs, I sprang up on to the prairie on the other side of the stream. As I reached a point whence I could see the sur-

rounding level, I caught sight of the game about 150 yards distant, running toward the hills, and saw that it was a mule-deer. Now, a mule-deer, buck or doe, will almost always stop on hearing an imitation of the cry of a fawn; so I bleated loudly, and in a moment the buck stopped, and turned round so as to face me. At the first shot I must have drawn my sight too coarsely, for I saw the ball strike the rocks behind and above him; the second was better aimed, and, striking the point of the left shoulder, pierced the heart. He bounded high in the air, and fell dead. Like all bucks at this season he was very fat, and the labor of packing his hams into camp was no light one. It was finally accomplished, however, and finding the wagon ready to pull out, we took our seats, and were soon traveling further into the mountains. After proceeding but a few miles, we picked up Mr. Reed, who had been exploring the mountains to the westward. He had seen no game except antelope, but to my astonishment had found these animals not only high up on the bare mountains, but actually feeding amid the undergrowth in the dead timber. My experience—and it has been an extended one—has led me to believe that antelope always avoided the timber, but my observations in these mountains have upset all my preconceived ideas on the subject.

We traveled for several hours in a northwesterly direction, and entered at length a valley, perhaps thirty miles in diameter, well supplied with grass and water, and abounding with antelope. A good hunter could have loaded a wagon with these animals in a day, but, as we were well supplied with meat, we contented ourselves with admiring their beauty and grace, and the swiftness with which they made off on our too near approach.

A camp was at length selected at the very foot of the mountains which towered 1,500 or 2,000 feet above us, and near a murmuring stream, which, flowing from the granite rocks of old Freeze Out, affords an abundant supply of cold and delicious water. Feeding unconcernedly on the bluffs within 500 yards of camp are numerous bands of antelope, and on the sides of the mountains we can see more than one well-defined game trail. The country certainly promises well and it shall receive a searching investigation before we leave it.

In Camp Among the Freezes Out Mts., Wyoming. Yo.

[FROM OUR OWN CORRESPONDENT.] FISHING IN FINLAND.

ST. PETERSBURG, AUG. 6, 1878.

You may remember that in my letter last autumn from Finland I spoke of an immense trout, "as large as a donkey," that had snapped innumerable lices, broken innumerable rods and devoured innumerable artificial minnows, and I told you that I was "going for that fish next summer." Well, I went for him, and if I did not get him I got his younger brother, evidently a chip of the same block. He weighed twenty pounds. What do you think of that for a brook trout?

The happy event took place at midnight on the 27th ultimo, I had been fishing on and off all day with indifferent success. We tried it again at 9 p. m., with no great luck. At 11 we returned to the club-house to see some friends off who meant to post all night to catch the morning train at Wiborg for Petersburg. As soon as they had gone we went upon the lake again. I had hardly got my totness fairly into the water when it was struck by a fish. He made so little fuss that I thought it must be a small one, and announced to my Finnish boatman that he was "mola," which is choice Russian for "small." After a while, however, he began to show more life, and soon he made my reel hum. It was not till I had him alongside of the boat, however, that I realized what a whale he was. When my boatman gaffed him he had to sit down in the boat and seize the gaff with both hands to hoist him in.

But truth compels me to say, that as far as my experience goes, these big fish do not give the play of smaller ones. I caught several ten-pounders. They were much more gamey than my "donkey." One litte fellow, it seemed to me, was as much out of the water as I in it. He made at least a dozen leaps, and continued them until he was gaffed. Every time he leaped I lowered the point of my rod. This proceeding did not meet with the approval of my Finnish boatman, who signified his disapproval by a number of guttural sounds, of which the principal was "niet," "niet," which is Russian for "no," but I replied with an equally emphatic "da," "da," which is good Russian for "yes," for I had read in that very practically useful book of yours, the "Sportsman's Gazetteer," that if a fish has the spirit to leap you should show your respect for his pluck by lowering the point of your rod to him. This is sound advice, and based upon good sense. His aim is evidently by the suddenness of the blow to tear the hook from his mouth. Slack up everything and there is no tension, and your gentleman's well-designed plan is defeated.

My big fish was thought worthy of immortality, so he was laid upon the back piazza, which is the museum of the club, and his portrait outlined upon the floor in the honored company of the other hero fishes of the club—only two of which, by the way, were heavier—a 21 and a 22-pounder. Then I took a red lead pencil and gave him mouth and eyes and fins of a beautiful carmine. My work evidently excited the admiration of the natives, for they crowded round in numbers to see the progress of the picture, and their remarks as translated to me were complimentary to my artistic skill. The fish I brought to town, and General Grant and a party of distinguished judges and lawyers from New York eat him and pronounced him to be delicious. His monument stands upon

the lonely shores of Lake Saima, carved in imperishable wood, *Perennium aere*, a proud witness to the skill of Yankee fishermen.

There has been remarkable fishing at Narakka this summer, showing that the prohibition of net fishing, and the close season from September 15 to January 1, have already done much to increase the number of fish, although the law is but two years old. The gentlemen who were at the club from July 1 to 15 caught so many and such large ones that they stopped from mere satiety. In the early part of July there is no night in these high latitudes—61 deg.—and when I was there was not more than an hour or two of darkness, from 11½ to 14. I fished one night till two o'clock, and at that hour the East was quite bright with the coming dawn. The night is the best time for fishing, as long as the fish feed, but I do not think they feed much after midnight; then they rest, to begin feeding again very early in the morning. At night the bait deceives them more readily, and they probably do not see the boat and rod very distinctly.

I spent a Sunday at Narakka. The Fins are a church-going people—all Protestants. The people who live on the shores of the lake have several immense church-going barges. It is a very pretty sight to see them returning, men and women rowing, the women in their best dresses, the men with their coats off; and the white sleeves of the shirts and the high colors of the dresses contrast very beautifully with the wild wooded shore and dark water of the lake. They frequently break into song, and sing their church hymns, which are very plaintive. It seems to me that all Northern music is plaintive, perhaps from the hard lives the poor people lead. But, plaintive as it is, the effect is pleasing and interesting.

Education is compulsory in Finland, but is confined, as far as compulsion goes, to the simplest elements. It is in the hands of the clergy, and the power is not abused, for here they have no political objects in view. The clergy appear to me to be the most suitable teachers, provided you can be sure of their not interfering in politics. In France the priests unfortunately cannot be trusted with the education of the young, for any priest would have instructions from his ecclesiastical superiors to teach the doctrine of divine right, passive obedience, and hatred of the Republic, and would have to obey. General Grant tells me that he was delighted with the Fins. He had formed the same idea of them that most of us have had—of an honest and hospitable, but uneducated and ignorant people; very much as we think of the Laps. He found them intelligent, educated, accomplished, hospitable and enthusiastic. They gave him a very warm reception at Helsingfors, though impromptu, and wanted him to stay several days with them and go to their great falls of Anutra. He would like to have stayed, but had made his appointments to be at St. Petersburg on the 30th July, and could not spare the time.

Finland is now in its beauty. The crops are green, the country is covered with the loveliest wild-flowers, and with the strawberries in profusion by the roadside. The roads are excellent. But the great drawback seems to be the want of public conveyances. To go from places to place you must post. Though this is not expensive—only three cents a mile for cart, horse and driver—it is a slow mode of traveling, for the horses are generally at work in the fields, or grazing in the woods, and have to be sent for and harnessed. All this takes time. They travel well—from eight to ten miles an hour—but the delay at the stations makes your journey, after all, very slow.

The total result of my five days' fishing was as follows: One fish of 80lbs.; one 13lbs.; three 10lbs.; one 8lbs.; one 3½lbs.; one 3lbs., and a multitude of a quarter and half-pound trout, of which we take no note in Finland, but call it "fishing for the pot." W. H.

[FROM OUR REGULAR CORRESPONDENT]

THE OLD DOMINION AND HER WEALTH.

ORKNEY STRINGS, SHENANDOAH Co., Va., Sept. 6, 1878.

It is the sportsman who enjoys the most beautiful portions of God's great work, and his keen appreciation of wild and picturesque scenery, rugged cliffs and quiet streams are qualities which add to his sociability and make him the more interesting as a companion. There are men who can break every glass bull thrown from a trap or bag nearly every year rising before them, but an expert marksman is not always a sportsman in the true character of the term. The mission of the FOREST AND STREAM AND ROD AND GUN is to inculcate a love for nature and proper enjoyment of the sports found in fishing and shooting, all tending to the mental, physical and moral advancement of man. The intelligent sportsman with some knowledge of ornithology, ichthyology, botany and taxidermy, although it may be limited, certainly enjoys the pleasures afforded by rod and gun more than the pot hunter. To some it is in springtime that nature appears in her most bewitching attire, but the sportsman loves the golden tints of autumn. Even now the sear and yellow leaf begins to appear, and ere the wane of the next moon the hazel nuts and acorns will be ripened, and the sturdy oaks all in russet clad. It is then the exhilarating atmosphere of the country can be most enjoyed. It is then the crisp keen air sends the blood coursing through the veins with renewed and quickened life.

Standing upon the summit of North Mountain, some 3,000 feet above the water, with the great Shenandoah Valley on one side and the lofty peaks of the Alleghenies looming up in majestic grandeur in the far West on the other, there is a view well calculated to hold one entranced in admiration of its matchless beauty. There are historical reminiscences all

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot gun can be converted into an accurate rifle. THE AUXILIARY BARREL will fit any standard make of gun of 10 or 12-calibre—calibre of rifle 32, 38, or 44 as desired. Length of barrel, twenty inches. The shells used with the best advantage are the Winchester Repeating Arms Co.'s cartridges, No. 32 and 38, extra long, and No. 44, model 1872. Send for a Circular and Price List.

AUXILIARY RIFLE BARREL COMPANY,

P. O. Box 715

NEW HAVEN, CONN.

Sharps Rifles Against the World.

Record of Sharps Rifles at Spring Meeting N. R. A., Creedmoor 1878:

MAY 23--LEECH CUP, for the Championship of America, won by Mr. Frank Hyde with SHARPS LONG-RANGE RIFLE, MODEL 1878.

MAY 24--Sharps Military Long-Range Match; Forty-eight Regiment team, using Sharps (Model 1875) Military Rifle; record, 800, 900 and 1,000 yards. Best record of any other Rifle, 270 170

In five-sixths of the matches in which the Sharps Rifles were allowed to be used, and were used, at the Spring Meeting of the N. R. A., May 23, 24 and 25, at Creedmoor, they won First Prizes.

THE WINNING GUN.

At the International pigeon shooting, Monaco, Feb. 1878, the Grand Prix de Casino, an *objet d'art* valued at 218, and a money prize of £105, the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Cholmondeley Kennell, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 38 yards and 1 foot and 2½ yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record. The winning gun at Monaco, was competed for by 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Purley, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 86 birds out of 100, using one barrel only.

The winning gun also at the great London Gun Trial, 1876, beating 100 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 6, 1875; No. 163,933. BEWARE OF IMPRIMENTS OR IMITATIONS.

Medicinal.

STOP AND READ.

All forms of Kidney diseases, Pains in the Back, Sides and Loins, are positively cured by

GRANT'S REMEDY.

Its effects are truly marvelous in Dropsy Gravel and Bright's disease. No matter of how long standing; the case may be, positive relief is had in from one to three days. Do not despair; hesitate or doubt, for it is really a specific and never fails. It is purely a vegetable preparation. By its timely use thousands of cases that have been considered incurable by the most eminent physicians have been permanently cured. It is also indorsed by the regular physicians and medical societies throughout the country. Sold in bottles at two dollars each, or three bottles, which is enough to cure the most aggravated case, sent to any address on receipt of five dollars. Small trial bottles, one dollar each. All orders to be addressed to

Bog River Blessings.

WE were four: Feeder, a tried manufacturer from the region of the once pure and unadulterated Fall River; Kinayk, a tall, slender Yankee "business fellow" from New Hampshire; Burkill, one of the best of shots and of artists and of fellows in New Hampshire; and Sohnyl, a dignified doctor and editor and Pennsylvania Dutcheman from Philadelphia. Four men less alike—except in their taste for venison—could hardly be gotten together, and therefore they were just the kind to camp out together. The Doctor started the ball rolling and picked up his chums on the way, so that when Montpelier, Vt., had been reached we were all together, happy and jolly, and about to enter the "good time" which had been planned by correspondence months before. All night at Burlington, and next morning we rode in the little steamer across Lake Champlain to Port Kent, where our conveyance, previously arranged for by Feeder, awaited us, to take us fifty-three miles into the wilderness. The stage-driver was a model "baggage agent." He made no attempt to smash our trunks, we noticed, but wherever they needed handling he invited some one to assist. "Blessings on the man," as Sancho Panza would say, who invented rifles and guns which you can pack in your trunk. Now all day through that wildly beautiful valley of the Saranac, whence New York gives up her iron wealth to the unrelenting miner, and where the iron yields its original sinfulness up to the persuasive alchemy of charcoal—onward and upward, until just at the hour of dusk we reached Martin's, on the Lower Saranac Lake.

Here we found other four awaiting our arrival—our guides, with their slender boats, to carry us to an objective point, sixty miles away. I must say a word about these faithful men, for all the pleasure of a month like ours depends so much upon the guides you have.

Edson Flagg is well known to many of your readers, for he has guided through the woods and waters in this region almost a quarter of a century. His principal recommendation, aside from his experience and amiability, lies in his length, which enables him to reach up a tree higher with an ax for the purpose of obtaining bark for the roof and side construction of a *sanctum sanctorum* in the wilderness, and to get his arms around a wounded deer, with his jack-knife at his throat, a shade sooner than any of his sect—advantages which the experienced will understand. He was appropriated by Captain Peckers.

Robert W. Nicholls has also had long experience, and few can excel him in manœvering a boat in such manner as will prevent the coveted game from "winding" you; and he is just as talented in camp as on the water, especially about an hour before meal times. He is the sole inventor and owner of a secret process for producing "Biscuit à la Bog River," which cannot be eaten in any other latitude and which would cause certain death to any one who ate them, or even smelled them, without the usual accompaniment of venison and maple syrup. When Rob was away from camp everybody was hungry. Kinayk was just "business fellow" enough to secure such a guide.

Hosea Colbath is another old trapper and woodsman, skillful and careful and faithful, with a knowledge truly astonishing as to just where you can get a shot or strike a trout. When he says "taint no use to try thar," why, then, *taint*, and you may as well as not surrender. Our good friend Burkill monopolized Hosea, and from the time the two met Hosea neither wore a nightcap nor said his prayers before going to bed, for the reason that he never went to bed, because Burkill never sleeps nor rests while he is in the woods, and therefore his guide needs neither nightcap nor prayers, for he is doomed until they two separate.

Alembert Corey belongs to a race of guides, and the race has improved in size and strength, for "Lem" is the largest of his tribe. He is the youngest of our four, but he began early in life, and is equal in skill to any. He can paddle his boat so suddenly and so closely to a deer that nothing but an attack of "buck fever" can prevent that deer from lying dead across your boat within a very short space of time. He is always on the alert, as quiet as the woods themselves, hears everything—even to the crackling of the smallest twig—sees everything. He knows every twist and turn of the Adirondack region, and is a most careful and skillful guide. He was awarded by the captain to Sohnyl, as a slight reward for virtue and good behavior, especially at meal time. "Lem" also cooked the venison.

The address of all these guides is Saranac Lake, Franklin

Co., N. Y. We bought our stores at Martin's, and, being all ready, started side by side down the lake on a bright Saturday morning. Our journey was southwesterly through the Saranac and Konka lakes, Roundtop, Tupper lakes, Stony Creek and Bog River to the Chain Ponds, passing on the way, of course, Bartlett's, Corey's and Cronk's. Before we reached Bartlett's we saw our first deer, head above the alders, calmly surveying us. It was a doe, and there were plenty of bucks ahead, so we all passed.

We arrived at the first pond on Bog River and there located, by taking possession of a little knoll on the north shore, where we cut and carved us a camp. In two days we had a splendid back house, cook-shed, dining-hall and all the conveniences, together with an icy cold spring near by, which was a real blessing. The first two nights we bunked in a tent. Scarcely had we fallen asleep on the first night when a loud splash in the water awakened us, and Feeder cried out: "Boys, did you hear that? did you hear him splash?" It was a fine fellow who fed near us. The next night about two o'clock, Sohnyl, awakened by some noise, went out to the door to see about it. Being somewhat of a mimic he barked like a cur and yelled "Git out!" at the imaginary canine. No sooner done than a great buck started within ten feet of him, and the repeated cracklings of the underbrush and the gradual fainter whoosh! whoosh! of the gentleman told how rapidly he was making his departure back to Hornet Lake. Kinayk said, "Boys, there are plenty of deer hereabouts, and we must get some to-morrow," and we all fell asleep again with murderous intent in our hearts.

But do not for a moment think that we were without meat all these two days. When we had passed the rapids on Bog River, Feeder pushed ahead of the rest of us to find something to eat. Hardly fifteen minutes had elapsed ere we heard the dreadful utterance of his gun. Our guides, having left oars behind, now paddled up, and before we came within twenty rods of Feeder he turned in his seat and cried out, "I've got him," and sure enough there was a fine young buck lying across the boat, whose sweet and juicy flesh contributed to our first meal ashore. Camp being in order by the third night, Feeder and Burkill went with their jacks, and each came back before midnight with a deer. And thus the sport, fairly started, went on for three red-letter weeks, and venison at every meal. Long Pond, Bog River and Mud Lake all contributed to our sustenance. We went to live and only killed what we wanted to eat, avoiding the does so much as we could. Kinayk and Rob, however, seemed determined one night to break this latter rule; for, not content with giving an old doe one Maynard ball, just enough to enable her to tell her next season's fawns how it felt, they had to scramble ashore after her with their jacks, and chase her around among the alders until her body held two more balls, and then they helped her into the boat and brought her to camp.

The old buck whom Sohnyl scared the second night craved us to the end. We all saw him, hunted him, fired at him, missed him, and there is a chance to get him yet. Any of our four guides will ensure you a shot at him at any time. If I were to attempt to tell you of all the events which transpired or the history in detail of each success, I would tire you and tax your space too much. We never shot but one deer on a trip, though we often saw four, five or six others, and heard as many more, never two under the same circumstances or looking at all alike. This endless variety of game is one of the great charms of this wild region. Neither did we spend our whole time hunting deer. Trout made a pleasant addition to our diet, and we never wanted for them. Both lake trout and "them speckled fellows" appeared often on the bill of fare, and, though not just in season, we had all the sport we wanted with the troll and with the fly until the time came when we reluctantly broke camp and bade good-bye to his delightful associations. Feeder will remember it because of his success, both as a murderer and as a feeder at the table. Kinayk will remember it because of his pleasant dreams there, and because he never turned over to get up without first having snored ten hours. Burkill will not remember it, because he was never there, it being his constant anxiety to get that old buck. Sohnyl will remember it because of his failure to eat all of the trout he caught, especially the "largest one caught on a fly," which rewarded his patience and persistence. The guides will never forget the four gourmands they had to cook for, and we left a notice up in camp that all who follow us are welcome to occupy it, provided they keep it clean and in order, and leave it so as we did.

Good-bye, now, *y basso profondo frogglegioni* of Mud Lake; adieu, sweet Phoebe bird, with your lazy, lingering Phoe-be-e-e-o-o! A *revor*, old hoot-owl, who cares for you? Good-bye, boys. Remember our promises for next year.

When Byron was in Venice he wrote:

" * * * * * this is breath!"

I have been in Venice, also, and although there are no wheeled vehicles there, nor horses, nor cattle, and it is still and lonely, yet the Venice of New York is so still that the touch of the rifle upon the boat side sounds and resounds for miles; and as to the air there, it

"is breath!"

Go try it, ye overworked ones: it will be a feast and a carnival to you, and yet not such a carnival as they have in Venice, which, being interpreted, implies farwell to flesh, for flesh and fish are plenty and allowable.

EDWARD LIVINGSTON SOHNYL.

For Forest and Stream and Rod and Gun.

CARIBOU HUNTING.

IT was in the month of March not long ago when I had my first adventure with caribou, for it is considered that in that month it is easier to kill the Canadian deer, as they are unable to run upon the crust which forms on the snow at that time of the year, but break through it and are thus impeded in their course and become an easy prey to the hunter. It was in true *Chasseur* style that we started from the city of Quebec in our search of the caribou. It was not a numerous party, but consisted of myself and friend, whose name for all purposes in these presents shall be Edward Wilks. Like myself, he had never before experienced the adventure of a caribou hunt, although we had often been together on a fishing expedition in the winter, and had hunted and tented alongside many a lake and stream, and set our night lines and caught numberless trout and lunges of fabulous weight. Often had we sat together in the evening in our temporary habitations, fatigued and drowsy after our day's amusement, talking over the chances of success, and calculating the best localities for the morrow. Many a mile had we trudged together along desolate roads, dragging our laden *traineaux*, sometimes weary but always with joy and happiness at our heart, for in the country, be it summer or winter, there is always in the air an exhilaration which excludes the possibility of that *ennui* which in the crowded city often oppresses one. We started from Quebec on foot, each having an Indian *traineau* packed with our rifles, ammunition, provisions and blankets. Our provisions consisted of tea, sugar, flour, biscuit, salt pork, salt and a few other articles, for in the bush one's difficulty is not appetite except in the way of quantity, and that is often a matter of surprise. The unusual exercise, the bracing atmosphere, both combine to render one voracious.

Our road lay to the westward, to lakes in the rear of Valcartier, about thirty miles distant from Quebec. Our start was made in the early morning, and we tramped steadily onward at the rate of three miles an hour, and did not make a stoppage till about twelve o'clock, when we halted at a hotel to partake of our *mit tag nash*, and have an hour's rest. Again we started with renewed vigor, and reached the turn-off part of Valcartier in the afternoon, and found two Indians, whom we had engaged in town to perform the hard work of camp life. They lived in miserable little shanties about twelve feet square, possessing in front a window and a door, and another window on one side. These buildings were within a short distance of each other, and were situated at the foot of a mountain. The Indians were both married men, but we saw neither square nor paragon, as we did not enter the abodes, for the atmosphere of such dwellings is generally far from pleasant or wholesome. They did not take long in making their preparations, in fact they seemed to me not to take more than a blanket a piece, and some tobacco, and, of course, their rifles and ammunition, which they placed on the *traineaux*. The latter they immediately took charge of, and we were not at all sorry to deliver them up, for our long tramp had rendered their weight rather a sore trial of endurance.

Our Indians were good specimens of the race, belonging to the Huron tribe, which occupies the Indian village of Lorette. Sioui, the elder one, was a noted *chasseur*, about fifty years of age, of a dark copper color, thin and slightly bent, caused, I presume, by the habit of carrying provisions on his back. His eyes were dark and quick, and he had no whiskers or any hairy ornament about his face. The other man, Gros Louis, was about forty, nearly as dark as the other, and of stouter build. Their chief occupation was either hunting for themselves or acting as guides to others. They sometimes also acted as assistants to surveying parties, in which work they are of great utility. As we trudged along they spoke of the many hunting expeditions they had joined, of the countless moose and caribou that had fallen victims to their unerring rifles, but they invariably wound up by saying that the deer were year by year getting more scarce, that in a few years there would be none to kill, and that the Indians would have to move further north. Sioui and Gros Louis were the most inveterate smokers I ever met. From the time we left their huts to the time we reached the camping ground their pipes were ever lit. It was near the edge of the lake, whose flat snow covered surface stretched outward for the distance of about eight miles and was nearly the same level. Its borders were fringed with tross of fir, birch and aspen, the latter two now bare and stripped of their leaves. High mountains completely surrounded the lake and were clothed to their summit with forest trees.

Our camp was a hut which had been built by former hunters, a log hut of about twelve feet square, and fortunately contained a stove, and the floor was strewn with dried fir branches and the remnants of utensils left by its former occupants. Our *chasseurs* were very busy, first to get some fresh fir branches and cut more firewood. Rapidly and scientifically did these Indians do their work. They unloaded our *traineaux*, placed the rifles and ammunition in safe positions, piled away the provisions, laid out our blankets, arranged the cooking utensils, procured water, and soon had a

kettle of boiling water, when we quickly had a bowl of good whisky punch—a reward for our long tramp. We had, however, to keep a good look-out after our cellular supply, for both our guides were well known as famous liquor consumers, Siou and Gros Louis, and had a couple of lines in the lake, and by the time we were well prepared, had caught a fine trout of over three pounds weight, which, with the pork and other adjuncts, formed a most hunger satisfying meal; after which a quiet smoke and a voyage of discovery concluded the day's experience, and, like quaint old Samuel Pepps, "so to bed."

It was about daybreak when I felt myself pushed by the shoulder, and Siou, my special assistant, whispered in my ear the magical word "Caribou." In his hand he had my rifle. I quickly rose and followed him out of the hut, taking my rifle from him, bringing his own. Gros Louis and Edward were still asleep. Siou stepped rapidly onward toward the lake, and when we reached a large birch tree, pointed out to the lake. At the distance of about forty feet were two caribou. In a twinkling I had my rifle to my shoulder, sighted my victim, and fired. With a bound in the air he fell on the ice. Siou immediately handed me his rifle and I fired at the oblique angle, which on the fall of the first, had started off to the opposite shore at a rapid pace. He stumbled, but immediately arose and continued his course. I was about to follow, but Siou said it was useless, that it would be impossible to overtake him, that he was wounded, and we would track him after breakfast. The report of the rifles had awakened Edward and Gros Louis, who came running toward us to find out what was the cause. Of course, there was a little disappointment and recrimination, but this was soon forgotten in the excitement of going for the dead caribou. He was a splendid buck, with heavy antlers. Very artistically was he skinned and cut up and brought to the camping ground and hung up, and very delicious was his cooked flesh at breakfast, with the addition of some fresh trout, taken by our night lines. We began to feel the fascination of forest life, an unaccustomed elasticity of spirits, an unaccountable vigor in our nerves and muscles.

It was a new life, and our breakfast had awe astonished the denizens of the city. There seemed to be no end of the quantity which was required to satisfy our hunger, and yet there was no sensation of surfeit. After finishing breakfast, and leaving Gros Louis to look after the camp, Edward and I, with our guide, Siou, started off on snow-shoes after the wounded caribou. We very quickly found his track, which was marked with blood, and followed the assertion of Siou, that I had wounded him. We crossed the lake and reached the other shore, but had not proceeded far when we found the poor animal lying exhausted on the snow. Siou gave him the *coup de grace*, and afterward skinned and quartered him. We then returned to the camp, and Siou recrossed the lake with a *traineau* and brought back our game. By the time it was properly hung dinner time had arrived, and we had so congratulated ourselves on our success that we decided not to seek for further slaughter that day, but rather to reserve our strength for the following. After dinner and a lazy smoke as a concomitant, Wilks and myself, leaving the two Indians idly enjoying their pipes in the camp, strolled off with fowling-pieces, for we had been told that ptarmigan might be found. Our but was erected in the midst of a wood containing birch, beech, maple and other trees, and there were clumps of those trees on different places.

We had not proceeded far when we came across a covey of ptarmigan, and on our discharging our four barrels among them we found fifteen birds to be bagged. There was no disputing that so far we were lucky in our hunt, and even our return to camp was not without its trophy, for we shot five hares, whose white bodies almost escaped our notice till we were within almost striking distance. Try as we might, we could not get the rarer of ptarmigan, with all the *de coeteris*, including real Lord Lieutenant's whisky with white sugar and lemon, and all these served up by the wild Indian, mid the primeval forests of Canada and on the shores of a lake whose beauties in summer are unrivaled. Horace, even in the Palace of Miceenas, delicately nibbling peacock pie and sipping the choicest Chian or Falernian wine could not have more enjoyed himself than did we on the shore of the nameless lake in the parish of Valcartier.

It might have been that success had intoxicated us, or it might have been that the unusual exercise had overtaxed us, or that the famous Lord Lieutenant's liquid had induced prolonged somnolency; but *n'importe*, we found next morning that early rising was a mistaken idea, and that bed even of fir branches was a luxury. Our Indian friends were, however, on the *qui vive*, and breakfast was ready ere we were awake.

We felt like pashas when the representatives of the forest, the descendants of Donnacona, the great chief of Stadacona, brought us fish, flesh and fowl—trout, caribou and ptarmigan—taken from their hunting-grounds, and cooked in *chasseur* style, and waited on us with more respect than they would have shown to their illustrious predecessor.

But breakfast cannot last forever, and, putting everything in order, we started off on snow-shoes, accompanied by Siou and Gros Louis, to try our luck across the lake to the other side, and struck up the mountain-side, not then coming upon a small clearing; but it was dreadful work climbing up the mountain steep, clambering over fallen trees, avoiding hanging branches, stepping over mountain rivulets, and passing over deep gorges and ravines. Steadily onward and upward we proceeded, surmounting difficulties to encounter fresh ones, but without any reward for our toil. We gained the summit of the mountain, and descended on the other side, and the descent seemed as difficult as the ascent, and sometimes even more dangerous, for a slip might give one an impetus which might hurl him to destruction. No tracks were found on the mountain, so we proceeded further on till we reached the base of a second, and walked round it without meeting with success.

The caribou had retired, leaving behind them no trace or track; the death of their fellows had baffled the hunt in the country and they retreated before us. So the Indians had decided; and as it was well on in the day, and we were many miles from camp, we made up our minds to abandon the chase to avoid being caught in the woods without food and shelter. So, somewhat disappointed, we commenced our return, but by no means up the sides of the almost inaccessible mountain. The longest way round was in this case, without

doubt, the shortest way home, and even that shortest way was filled with difficulties. Huge fallen trees continually barred our way, immense drifts of snow buried us in their depths, and low branches and thick bushes impeded our path. But we had no mountain to climb, and that was something to be thankful for, as, laden with our rifles and ammunition, it was extremely difficult on snow-shoes to overcome a declivity far steeper than forty-five degrees; in fact sometimes so much so that we were obliged to haul ourselves up by the bushes and branches. On reaching camp we gladly threw ourselves on the grateful couch of fir branches, and lazily watched our Hurons preparing supper. It was a repetition of the breakfast, and was done full justice to. On the morrow we started early before breakfast, which we procured at a farmer's house in Valcartier, where we settled with Siou and Gros Louis, and relieved them of the laden *traineau*, laden with a sufficiently satisfactory spoil—two caribou, eight and a half brace of ptarmigan, six dozen of trout and seven hares—the Indians having increased our bag of ptarmigan.

From the farmer, in whose house we breakfasted, we learned that two bears had been shot in the vicinity on the previous day, and had been taken into town for sale. We engaged a man with his *berlin*, an open wooden box on runners, to take us to town. Into this *berlin* we stowed our game and packed our firearms and ammunition and what was left of our stock, and on the top of all placed ourselves, well wrapped up in buffalo robes. Our driver was a young lad who seemed to be of no conventional turn, for his sole utterances were, "Get up, Bess," and certainly Bess did her best to "get," for we arrived in Quebec in an incredible short space of time, and surprised our friends and disappointed our enemies by our success. It was the first time we had been out caribou hunting, but it shall not be the last.

T. J. O.
Quebec, September 10, 1878.

For Forest and Stream and Rod and Gun.

A POEM BY FRANK FORESTER.

AS the years pass away over the dead grave at the Cedars, the love for Frank Forester and the admiration of the sporting world for his genius seems to increase, and his writings are more and more sought for, treasured up and quoted as the very highest authority in all matters of the rod and gun. As he wrote only in prose it is not generally known that he had any claims to be considered a poet, and indeed we have never met with any poem from his pen, with the single exception of the very pretty poem that we now send you. We have lately received it from our relative, Mrs. Col. H., who was cousin to Miss Sarah Barker, the first and dearly loved wife of Herbert. The lines were written by him at Portland, Me., in one of his shooting excursions, and where he first made the acquaintance of Miss Barker. Our friend informs us that at that time—in the fall of 1839—a little party of young ladies and gentlemen made an excursion to Cape Cottage at Cape Elizabeth, near Portland, where the hours were pleasantly passed in sport and dance. It was then that Herbert became deeply fascinated by Miss B., who was a young lady of great personal attractions, and on the return of the party to Portland he wrote and presented to her these verses. He soon afterward made her an offer of marriage, which was not then accepted. On her return to Bangor, of which city her father, a wealthy merchant, was mayor, he followed her and renewed his suit, which was favorably entertained, and the couple were united and proceeded to his home in New York, where, and subsequently in Philadelphia, they passed several happy years. In due time a son was born to them, who was sent to his friends in England to be educated. On their return to Philadelphia a little girl was born, but did not long survive.

Our lady relative, from whom we have received these verses, renewed to New York her intimacy with her cousin Sarah and Herbert, and was in constant intercourse with them, and she thinks that their married life was most happy. Soon after the birth of the girl Sarah became dangerously ill with hemorrhage of the lungs, and did not long survive the attack. After her death Herbert sent everything to her mother save a curl of her hair and a pair of slippers, and this lock of hair was found upon Herbert's heart after his death. Herbert's family kindly inquired into the matter, and our friend has seen affectionate letters from his mother to Sarah and also old family jewels sent to her. Herbert was proud of his beautiful American wife, and loved her sincerely for her many good qualities. Though Herbert wrote not in verse, his fascinating pages bloom with the sweetest flowers of poetry, and his spirit takes us kindly by the hand to lead us onward into the fair precincts of the natural world. We remember his poetic descriptions of the woods, the shades of the principal forest, over the rustling grass of wind-swept prairie, deep in the heart of embowered dells and copses, along breezy hill-sides, by borders of the tumbling brook, or the hoarse resounding ocean. The light of his pen falls upon all places beautiful or majestic and illuminates them with fresh glory. He was the most brilliant and copious of all writers on sporting topics, sketching in faithful prose, yet with all the enchanting power of the poet, the varied scenery with all forest game have their haunt. Thinking that these pretty verses, the only poetic tribute we have from his pen, would be valued by his admirers, we venture to offer them.

Sheller Island, Sept. 12, 1878. ISAAC McLELLAN.

A minstrel stood upon a foreign strand,
Forced by tyrannic power abroad to roam,
Nor viat more his old ancestral home.
Till, from the malices of that stranger land,
A wreath were cast of glory, and his cheer
Of long or later grazed the country sphere.
Zar, far, he roamed; doubt, peril and dismay
Lowered dark and dismal o'er his toilsome way.
When hope was fled, when naught remained behind
But aspirations high and fearless mind,
He reached this city, where Old Ocean smiles,
In dazzling splendor, round three hundred isles.
He saw the glories of that gorgeous scene—
Ere an emerald glaze was o'er his vision thrown.
He saw and gazed. Where skies so brightly shine;
Where all of earth, air, water, is divine,
Most lovely there, of all created things,
Most woman be! He tuned his humble strings,
And forth he tripped, a bright, celestial throng,
To the poor magic of a stranger's song:
"Thine done," he cried; "thine done; the toil is o'er;
The prize is won, here on this eastern shore;
For who can mark the blent expressions rise,

Fall fraught with soul in Minnie's glorious eyes?
Who look upon the clear and sparkling grace
That crowns the young Francesca's fairy face?
Who catch the gems that fall, so careless cast,
From Anna's lips, so dainty and so fast,
So free and fearless; she for whom one breath,
Is the far forest of the boundless West,
Beats worthily? Who see, so young and fair,
Sarah beside her sweet and kindred pair?
Fit sisterhood, who marvel at the staid
Or queenly Julia, merrily sedate,
Serenely courteous and superbly bright?
Who look upon the quick and flashing light
That leaps from Georgiana's every feature
Most artless, innocent, bewitching creature?
Who gaze on Susan, now-extinct grace,
All woman misanthropic and woman proud,
Her self-erected looks and eyes of azure hue,
Mocks the most lovely heaven's most lovely blue?
Who can behold and dream that seven like these
Bloom on the softer shores of southern seas?
'Tis done! 'Tis done! The high empires gained;
The minstrel's task is o'er, his end attained.
Francesca, Minnie, Sarah, Julia, Ann,
Georgiana, Sarah! Match them if you can!

Portland, Sept. 17, 1839.

HENRY WILLIAM HERBERT.

Fish Culture.

ALL ABOUT EELS.

A letter published in the *Augstberger Abend Zeitung* having made the statement that eels had been found in eels containing live young ones, Mr. A. F. Clapp, of the *Sanbury American*, wrote in regard to this to Professor Baird, and received from him the following reply:

U. S. COM. FISH AND FISHERIES,

Gloucester, Mass., Aug. 27, 1878.

Dear Sir: I am much obliged to you for the continued transmission of your journal, which I always receive and read with much pleasure.

I notice in the number of the 23d of August an article upon the propagation of eels, in which you reproduce from a German journal an account of an eel, which, on being opened, was found to contain living young. It may be of interest to know that this was no eel at all, but a marine fish known as *Zoetes viviparus*, not in any way related to the eel, but which has been known to lay its eggs inside its own body and discharging them alive.

Eels, when opened, are frequently found to contain small, thread-like bodies, generally supposed to be their young. These, however, are in all cases intestinal worms, and are found in the stomach and intestines, and not in the ovary. At the present time there is not the slightest uncertainty in regard to the character of the eel. It is well known to be bisexual, males and females like other fish, and reproduces its kind from very minute eggs, which are discharged in the water.

You will find in my last report, of which I have the pleasure of sending you a copy, a full account with illustrations of this eel, as prepared by Dr. Sýrský, of Austria. I myself, received from the coast of Massachusetts, last autumn, a supply of eels in full spawn, of which preparations were made, and are now exhibited at the National Museum, Washington.

Yours truly,

A. F. CLAPP, Esq.

SPENCER F. BAIRD,
Commissioner.

Some month or more ago Robert B. Roosevelt, Esq., to whom this German statement was referred, wrote to us that the living forms in these eels were nothing but intestinal worms. We are just in receipt of the following letter from a correspondent:

SALEM, MASS., Sept. 13.—*Editor Forest and Stream:* In reference to spawn in eels, I would state that on the 3d of June last I accepted the invitation of Mr. E. B. Damon, of Rowley, to fish Parker River for striped bass, and being short of bait I fished for and caught an eel. The same being too large and life too short to try for another, we concluded to trim down the one we had, and in so doing it we found it quite full of spawn. Mr. D. remarked at the time that it was the first time he had ever noticed the like, and was quite excited over the circumstance. As for myself, not taking much stock in eels, I did not care whether they spawned or folded their young; but such is the fact, as Mr. Damon and his son, who was also in the boat, can testify. O. T. J.

Further and to us conclusive testimony is furnished in the following:

U. S. COM. FISH AND FISHERIES,

Buckport, Maine, September 14, 1878.

EDITOR FOREST AND STREAM.

I have read with much interest the discussion going on in your columns in relation to the natural history of the eel, and I think it is now time for me to contribute my mite. While engaged in taking schoolish salmon at Grand Lake Stream last autumn thirty-two eels ran into our inclosures and were captured and eighteen of them examined. They were running down stream in the current, and that is because our inclosures were so constructed as to take the fish that were descending the stream and no others. These eels were nearly all of large size. My note book shows four of them to have been 29, 33, 35, and 36 inches long, and to have weighed 44, 52, 63 and 64 ounces respectively. They were all very plump and fat, and their abdomens somewhat distended. On dissecting them I found their stomachs empty, but their abdomens were filled with what first appeared to be two masses of glistening white fat. More careful examination revealed the fact that the supposed masses of fat were constructed in folds as are the ovaries of fishes generally, and after catching this idea it was not difficult to perceive with the naked eye that the whole mass had the appearance of being composed of very small globular bodies, embedded in or connected by tissues. I placed a very thin piece of glass over a microscope and could then see plainly that it consisted mainly of globular bodies of various sizes, the largest being about 1-125 inch in diameter. My previous and subsequent studies on the ovaries of other fishes leave me no chance to doubt that the globular bodies were the eggs, and the entire masses were the ovaries of a female eel. I sent specimens of these eels to U. S. Commissioner Baird, and he reported that there seemed to be no question that the ovaries were filled with eggs. My opinion as to the character of the organs I examined is further supported by the previous researches of Dr. Sýrský, of Trieste, who made pretty exten-

Natural History.

THE POMPAÑO.

live researches in 1873. His paper on the subject, with illustrations showing the reproductive organs of the eel, was reprinted in the appendix to the third report of the U. S. Commissioner of Fish and Fisheries. I made a rough estimate of the number of eggs contained in the ovaries I examined, and obtained the immense number of two millions in one eel and four millions in another, of full sized eggs, while there was also an immense number of eggs of smaller size in the same ovaries. All the eels examined at Grand Lake Stream (Oct. 23 to Nov. 14, 1877) were females. European investigators have found that the male eels are always small. Dr. Syrski says that of 258 eels examined by him the males and females were in about even proportion; the greatest length of the males was about 430 millimeters (17 inches), and the females were all at least up to 1,050 millimeters (41 inches). The eels that we examined at Grand Lake Stream had empty stomachs without exception. There was an abundance of young fish and other food in the stream and inclosures, and it is therefore evident that they were descending the stream, not for food, but on some other errand. It is also a fact beyond question that in all of our rivers in Maine there is an immense migration of eels toward the sea in the fall. This migration is the basis of quite an extensive fishery for eels, conducted by means of traps so placed as to take those descending the rivers, but not ascending. There is also a migration of very small eels (2 to 6 inches long) up the rivers in early summer. No one who has watched their behavior at dams and other obstructions near idle water, as I have done, could question the fact of their ascending at that time. At very difficult falls they will leave the body of water and wriggle their way over moist surfaces with their bodies exposed to the air. In this way, I have no doubt, they can pass falls twenty feet or more in height, for I have repeatedly seen them higher than I could reach, wriggling up the perpendicular face of a plank bulkhead, where there was the very slightest possible trickle of water. Take these two facts together—the descent of gravid females in the fall and the ascent of very small young in the spring time and early summer—and they lead to the irresistible conclusion that eels go down to the sea to lay their eggs, and the young or a portion of them, ascend the rivers to feed and grow. Of course there may be exceptions to this rule. I think it highly probable that there are. Eels are reported to be found in some fresh water lakes, where the difficulties in the way of ascent from the sea appear too great to be overcome even by young eels. I hope the interest in this question will not subside without leading to many new and careful observations.

CHARLES B. ATKINS,
Assistant U. S. Commissioner Fish and Fisheries.

FISH CULTURE IN HOLLAND.

We are indebted to the Superintendent of the Netherland Fisheries for the following most interesting matter:

BERGEN-OP-ZOOM, Sept. 2, 1878.

Oyster culture is a perfect success this year, and the tiles were covered with spat. Last year the drop of spat was very irregular, and on an average but middling. Still the loss after taking the spat from the tiles, until they were sowed out on the banks, was considerably less than formerly, and I expect the heavy losses of before are overcome. There is on lease now an area as large as half Newark Bay for about \$100,000. The system of leasing works is admirable. Very few years ago there was no oyster culture in the country. The oysters were imported from England and Scotland, but this belongs to the past. The banks were almost killed out by the free fishing. If you are not careful in America things may come to the same end. Production is already increasing. Very large capital is invested, and in the employ of the lessees the fishermen make more money than formerly. As soon as I can get work I will write a paper for you on oyster culture in Holland and the Netherlands. Still, if we don't get ice enough to close the fishing next winter, I do not expect to have time to write before another year has elapsed.

I hope to obtain some eggs of *S. quinque* from Prof. Baird to make a trial with. If I am successful a great many points will be settled at once. It will have its greatest effect on fishermen, who, as we know, still believe in fish culture. In our salmon fishing it is only a few seasons ago that we were again November 15 for winter salmon, which are seemingly yearly increasing, and have been very abundant this year. In former years the price was from \$3 to \$1.25 per pound. This season they fell as low as \$1, 40 cents and even 35 cents. But the fishermen did not suffer, because the quantity covered by far the deficiency in price.

It is a proven fact that when the catch of grise is poor in one year, the catch of summer salmon the next year is poor too. The fishermen hold it so, and our statistics seem to prove it. The report of the fisheries under my control will shortly be printed. Whenever I receive a copy it will be forwarded to you.

Yours very truly,
C. J. BOTTENMAYER, Superintendent of Fisheries.

MUD TURTLES IN FISH PONDS.—San Francisco, Cal., Sept. 5.—The common mud-turtle does the same mischief that his brother, the snapping turtle, is accused of. I know from experience that both are very destructive to small fry of an inch or two in length. Two years ago I put four or five thousand small fry in one of my ponds, which had a bottom at one end, and I noticed for about a week that the water became very muddy once or twice a day, and almost every morning when I visited the pond, that my fish were growing less in number very fast. Finding the water clear one day I examined the bottom very closely and could discover nothing. An hour after I had passed the pond I found it muddy. Taking a garden rake I raked the bottom, and placed them in a wooden can, one fourth full of water, under the shelter of some shady trees. In time they dropped their tails, and put forth their tiny legs, and assumed the shape of a lizard, finally becoming upright little frogs. While in the lizard state I was surprised one morning to find one or two of them almost entirely consumed, the skins lying at the bottom of the can. As I kept nothing else but "lizards" in the can, and the latter covered with a cloth, I am at a loss to explain this discovery.

B. B. P.

RAISING TADPOLES.—Port Richmond, S. I., Sept. 12.—Editor Forest and Stream: As my efforts have met with better success than Mr. Roosevelt's, I beg to state a few interesting facts. I have taken the little creatures when scarcely larger than a pin's head, and placed them in a wooden can, one fourth full of water, under the shelter of some shady trees. In time they dropped their tails, and put forth their tiny legs, and assumed the shape of a lizard, finally becoming upright little frogs. While in the lizard state I was surprised one morning to find one or two of them almost entirely consumed, the skins lying at the bottom of the can. As I kept nothing else but "lizards" in the can, and the latter covered with a cloth, I am at a loss to explain this discovery.

J. F. K.

Perhaps one tad eat another tad.

A LATE number of the Boston Transcript mentions "that a pompano was caught off Wood's Holl, and that it is the first of this kind caught in these waters, being strictly a Southern fish." Our excellent Eastern contemporary is partly right and partly wrong, as we have two species on our coast, the *Trachynotus carolinensis* and *T. ovatus*, all members of the genus *Gasterosteus*, from the resemblance of the spinous dorsal to that of a stickleback. Both these species were taken at Wood's Holl in 1874, by the U. S. Fish Commissioners, and frequently since that time. Both these species have been caught abundantly, more especially the young specimens at various points on the north shore of Martha's Vineyard, at Wood's Holl and Watch Hill, R. I. Professor Baird found innumerable five-inch specimens at Little Egg Harbor as early as 1854. No fishermen had caught them before this time, as their nets were not adapted for the purpose. There is no doubt but that they are abundant south of Cape Cod, though they do not seem to come within range of the weirs. Very possibly our Northern fishermen do not know how to catch them. The pompano feed on crustaceans and small mollusks. We would refer our readers to more complete details published by us in Vol. IV., pages 5, 85, 117. We have recorded the catch of good sized pompano in the Sound not far from New York. At present pompano are fairly abundant on the New York markets, coming from Norfolk. As a table fish it is decidedly the best that swims, and far better than the English turbot.

SAPPHIRINA.

CAPTAIN MORTIMER, who every time he crosses the broad expanse of the sea in his good ship the *Hamilton Fish* makes some addition to our stock of knowledge, has succeeded in bringing alive to New York some of those curious little creatures called *Sapphirina*. These minute crustaceans are found in the Atlantic Ocean in incalculable quantities. They measure about three-sixteenths of an inch long, are one-thirty-second of an inch wide, and but a few lines in thickness. Their great peculiarity is that they gleam like emeralds, rubies, amethysts and opals in the salt water. Motes dancing in the sun have at times brilliancy of color, so in the medium of the ocean as the light strikes these sapphirins they too shine and flash. We have but the merest inkling of all the wonderful things the sea holds in her bosom, or how many dainty and delicate forms she treasures. Not it struck Captain Mortimer, who, when having anything to do with nature's secrets, is shrewdness itself, and, though he may greatly indulge in guessing, court-martials all the facts, vigorously holding an inquisition on all his speculations, that this opalescence in the sapphirina was not caused by what is called phosphorescence. How could these tiny creatures show their many colors when the sun was shining in the water? Catching them, the Captain placed some sapphirina in a glass tube. Now they were invisible, but on turning them at a certain angle, when the rays of light struck them, out flashed the colors. Evidently these gleams must be caused by the decomposition of the ray of light on the surface of the sapphirina. Fishing, then, in a basin for specimens, our nautical naturalist succeeded in picking out one by one, by their flash alone, these tiny animated jewels. But how to keep them was the question? Alcoholic preparations, and, in fact, all other preserving fluids, are well enough in their way to keep form and some semblance of shape, but alas! all the delicate colorings fade away. The Captain bethought him for future observations, of putting his sapphirina in a sirup, and in this way has succeeded in keeping some, which still show faint colors. This, of course, proved that the gleams were not due to animal movement. Others of the sapphirina, the Captain having simply put them in water, he was fortunate enough to bring into New York. But they were short lived, and all died in a day or so. How this color comes and goes, is, of course, due to the light, but what peculiar construction of scale the sapphirina has remains yet to be studied. Do the brilliant colors of fish, as shown in the mackerel, arise from minute series of lines on the skin which split up the ray of light into all the tints of the rainbow are disclosed, or can there be a series of discs, like on the feathers of birds, which give out metallic tints? We are pretty sure that this problem will sooner or later engage Captain Mortimer's attention, and that some day, when sailing over a summer's sea, with a gleam of the sun illumining his cabin, with his microscope on his table, the mystery of the beautiful lights in the sapphirina will be made clear.

Whether the ship is tied to the dock in New York or Liverpool, or thrashing through the waves between two continents, that Captain of the *Hamilton Fish* has not only his eyes on his vessel, but is ever revolving in his brain how to solve and fathom the many beautiful secrets of the deep.

For Forest and Stream and Rod and Gun.
DRUMMING OF RUFFED AND CANADA GROUSE.

I HAVE read with close attention recent articles in your paper on the above subject, but am not sure that I fully understand just how much is claimed by the writers. If they simply mean that the grouse can drum on the ground or on a

rock, or indeed in any place in which he happens to be, I am ready to admit it; but if they intend to assert that the same effects will be produced as when standing on a hollow log, then I not only wholly dissent, but respectfully submit that such a thing cannot occur, unless the grouse has the power of suspending the laws of nature; for I believe it is a universally admitted fact that the power of all vibrations is increased by contact with a sonorous body, and one might as well say that the sounding-board of a piano was useless, or that a music-box would play as loudly when held in the hand as when placed on a sheet of plate glass, as to claim that the bird can drum as loudly on the ground as when more favorably situated. Nor do I depend upon theory alone, having proved by actual experience, time and again, that the distance at which the drumming can be heard is wholly dependent on the character of the object on which the grouse is standing, be it rock, root or log. Of the maneuvers of which "Monon" speaks I know nothing, as no such conditions exist in the New England States. The birds all single out before the approach of the breeding season, the males selecting their drumming places, which they use only during the absence of the female, and I never saw two of the latter together during such seasons.

In regard to approaching the bird while drumming I used to be in an easy manner, all things must be judged by comparison, and the difficulty of stalking within eighty paces of an old buck, feeding, head toward you, in an open meadow, without the slightest cover within a quarter of a mile, is so much greater that the former is not to be mentioned in comparison with it; yet this latter feat has to be accomplished when one is armed with a shot gun only, or one must lose caste as a first-class still hunter. For the benefit of those who wish to see the ruffed grouse while drumming, I will describe the method by which I have frequently secured twenty feet of them, unobserved, when I could watch them at leisure. In order to do this successfully it is necessary to sight the bird without being seen, to find out which way it is facing and then approach it from behind (when it begins to drum it seems to be oblivious to all other sounds), then make a short run, dropping before it ends, and remain perfectly motionless till it begins again, when the same thing is to be repeated, till one is near enough to the bird to see its maneuvers with ease, of course selecting some cover at the end of the last advance to screen one from observation between the intervals of drumming. The bird, before commencing, seems to go into a sort of ecstasy, spreading its tail, erecting its ruff and ruffling its feathers. Then it stands perfectly upright, smooths itself, brings its wings well forward in a vertical position, and strikes them horizontally toward each other. The wings do not strike each other, or the body of the bird; but simply beat the air in front of it. It will be readily seen that in this position the action of one wing counteracts that of the other, and has no more effect to move the body of the bird than would the action of two rowers to move a boat when seated in it and pulling with equal force in opposite directions. It is not strictly correct to say that the ruffed grouse begins slowly and increases its strokes in quickness to the end of the "beat" made at the end of the drum as follows: He delivers three strokes deliberately, and then, after an interval between each; then a pause about as long again as that between the strokes, then three more in exactly the same time as the first, then the fourth a little quicker, increasing the rapidity of his strokes till he sounds a continuous roll which is prolonged for a short time, ending in a sort of flutter as the bird recovers his normal position. Now if, as "Monon" claims, the bird produces the noise of a drum, then the first of the inflated pouch, he must time the operation very nicely down performance of the slow strokes, as it would long ago have been detected; it also seems as if the noise made must sound louder, if his theory is true, while standing close to the bird than at a distance, but the reverse of this is the fact. The rumbling sound like distant thunder is not apparent at such times, the "roll, wish, wish" of the bird's wings being plainly heard and not much else. The first of the inflated pouch family whose drumming I wish to notice. This is the grouse, or "spruce partridge," as the hunters call it. The male of this species is undoubtedly the handsomest game bird in New England, but they are held in little esteem from the fact that their flesh is so strongly impregnated with the odor of the spruce and fir boughs on which they feed as to be unpalatable when sent to market in the ordinary manner, but if drawn and not much else. The first of the inflated pouch family whose drumming I wish to notice. This is the grouse, or "spruce partridge," as the hunters call it. The male of this species is undoubtedly the handsomest game bird in New England, but they are held in little esteem from the fact that their flesh is so strongly impregnated with the odor of the spruce and fir boughs on which they feed as to be unpalatable when sent to market in the ordinary manner, but if drawn and not much else.

This bird selects a horizontal branch after a few feet from the ground, and drums in the air while descending from the limb to the ground. This species of grouse are so utterly indifferent to the presence of man as to continue their drumming with a person standing in full view, often alighting within a few feet of the observer, and some of the older males are even belligerent, bristling up angrily at the intruder, and, if he feigns alarm and slowly retreats, will chase him for some little distance. It is interesting to watch them while in the act of drumming, their wings moving with sufficient rapidity to carry them through the air with the velocity of an arrow; but their body all the time slowly settling toward the earth, alighting each time on almost exactly the same spot. The drumming is always performed while descending, the bird flying close to the limb in the ordinary manner. When standing close to the bird the noise sounds much louder than that of the ruffed grouse under the same conditions, although it cannot be heard one-tenth as far, and for this reason I have always believed in the hollow log theory. In regard to finding the latter bird in unusual situations in the autumn, as mentioned by "Awabsoo," the fact that they are so found is well established, but the villages in Maine being visited by them each succeeding autumn, and I have frequently flushed them in orchards at such seasons, in the early morning, when the nearest cover would be a mile away. The hunter's explanation will not hold, as a mid-summer shower or a howling snow storm makes a great deal more noise than the softly falling autumn leaves; but I think I can offer a consistent and reasonable explanation. Every one who has had an opportunity to observe the habits of the ruffed grouse will have noticed the persistency with which it clings to its chosen location, a flock, unless frequently hunted, scarcely moving over tree acres or a hundred in a whole season. Now if this characteristic was always retained, places, which from overhunting or any other cause had become stripped of their grouse, would forever remain depleted; therefore, by a wise provision of nature, the instinct of partial migration is implanted in the breasts of a portion of the flock, and by this means barren districts are continually restocked. The same instinct can be found in our most abundant forest denizens, from squirrels to deer. I see that my innocent article on the "King Partridge" has occasioned a good deal of comment, in one instance prefaced by piscatory allu-

Scottish deerhound, the only one in its class, was well deserving of the prohibitory price attached to his kennel. The collies were a very fine exhibit; the Newfoundland too large and badly crossed. There was a pretty English coach dog, and two very fine bulldogs and terriers, one of each white in color.

To specify the merits of the deserving would require more space than our crowded columns would warrant, and I therefore forbear. The show was peculiarly successful, and the large attendance proves unusual interest in kennel exhibitions. I send an official list of awards and entries, kindly furnished by Supt. Chas. Lincoln, by whose most satisfactory management the show was made so popular and creditable:

LIST OF ENTRIES.

Class 1—Champion Imported English Setter Dogs—W S Timberlake, St Paul, Grand Duke; J H Whitman, Chicago, Clipper; E H Gilman, Detroit, Boppo; J E Shipman, St Paul, Joe; Meesonger's Rock—Bruce's June; H Shipman, St Paul, Joe.

Class 2—Champion Imported English Setter Bitches—W S Timberlake, Lady Cyprus; J H Whitman, Maggie May; Herbert Preston, Chicago, Naomi.

Class 3—Imported English Setter Dogs—John Davidson, Monroe, Mich. Afton, Laddie; W S Timberlake, Grand Duke; J H Whitman, Clipper; E H Gilman, Boppo.

Class 4—Imported English Setter Bitches—John Davidson, Monroe, Mich. Afton, Laddie; W S Timberlake, Grand Duke; J H Whitman, Clipper; E H Gilman, Boppo.

Class 5—Imported English Setters, Puppies Under 12 Months, dog or bitch—R B Morgan, Quaker City Kennel, Richmond, Ind. F. C. C. Norbeck, La Crosse, Wis. Victory; George Waddington, Geneva, Ia. Lily White.

Class 6—Champion Native Setters—Dogs of Any Strain—H E Barron, Farnham, Minn. Don Pedro; E O Waller's Jack; E H Gilman, Boppo.

Class 7—Champion Setters Bitches of Any Strain—J H Whitman, Maggie May; W S Timberlake, Lady Cyprus.

Class 8—Native English Setter Dogs—T L Cory, Winona, Black Duck; O C Humphrey, Minneapolis, Sport; E H Waller, St Paul, Duke; G H Lane, Jr., St Paul, Duke; H L Lane, Hunkies, Minn. Zach; H Salzgard, St Paul, Sport; W B Baldwin, St Paul, Don; E O Waller, Chicago, Jiff; W S Timberlake, Grand Duke; J H Whitman, Clipper; E H Gilman, Boppo.

Class 9—Native English Setter Bitches—George Waddington, Geneva, Ia. Lily White; W S Timberlake, Lady Cyprus; J H Whitman, Maggie May.

Class 10—Native English Setter Puppies Under 12 Months—Don Pedro, H E Barron, La Crosse, Wis. Victory; George Waddington, Geneva, Ia. Lily White; E H Barron, Don Pedro; E O Waller's Jack; E H Gilman, Boppo.

Class 11—Champion Irish Setter Dogs, Free for all—St Louis Kennel Club, St Louis, Mo. Duke; E F Stoddard, Dayton, O. Friend; E C Waller, Chicago, Fanny Fern; E F Stoddard, Dayton, O. Ruby.

Class 25—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 26—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 27—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 28—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 29—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 30—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 31—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 32—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 33—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 34—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 35—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 36—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 37—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 38—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 39—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 40—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 41—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 42—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 43—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 44—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 45—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 46—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 47—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 48—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 49—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 50—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 51—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 52—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 53—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 54—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 55—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 56—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 57—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 58—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 59—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 60—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 61—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 62—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 63—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 64—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 65—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 66—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 67—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 68—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 69—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 70—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 71—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 72—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 73—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 74—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 75—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 76—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 77—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 78—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 79—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 80—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 81—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 82—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 83—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 84—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 85—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 86—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 87—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 88—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 89—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 90—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 91—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 92—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 93—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 94—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 95—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 96—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 97—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 98—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 99—Champion Gordon Setter Dogs, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class 100—Champion Gordon Setter Bitches, Free for all—A A Mellier, Jr., St Louis, Mo. Knight; H E Barron, Don Pedro; H E Barron, Don Pedro; H E Barron, Don Pedro.

Class F—E F Warner, Mab.
Class G—S B Dilley, Ranger.
Class H—S B Dilley, Fleet.
Class I—J H Whitman, Paddy.
Class J—Arthur Lyon, Pedro, Warrior, Ajax, Brutus, Scandal, Whimsical.
Class K—J G Paschke, Beauty.
Class L—J H Whitman, Doctor.
Class M—Best Braces English Setters—W S Timberlake, Grand Duke and Lady Cyprus.
Class N—S B Dilley, Countess Royal and Royal Fan.
Class O—S B Dilley.

MINNESOTA FIELD TRIALS.

First Day—Tuesday, Sept. 10.—Weather, 6 A. M., cloudy, very cold and blustering, wind southwest; 12 M., clouds broken, wind still very brisk and temperature low; 3 P. M., wind veered to northwest, weather clearing and moderating. All hands in buffalo robes and heaviest coats; 6 o'clock, clear and calm.

FIRST TRIAL.

Nursery Stakes for Setters and Pointers Under 12 Months.

First prize, \$20; second, \$10.

Entries as Drawn.	Owner.	Residence.
1..... Fairlie Belle.	Mr. B. W. Grant.	Richmond, Ind.
2..... Nellie.	B. Baupre.	St. Paul, Minn.
3..... Tempest.	G. Wadlin, Jr.	Geneva, Iowa.
4..... Strathroy.	D. C. Sauer.	East Aurora, Mich.
5..... Lily White.	G. Wadlin, Jr.	Richmond, Ind.
6..... Duke.	H. C. Sauer.	East Aurora, Mich.
7..... Judge.	H. C. Sauer.	East Aurora, Mich.
8..... Judge.	H. C. Sauer.	East Aurora, Mich.
9..... Judge.	H. C. Sauer.	East Aurora, Mich.
10..... Judge.	H. C. Sauer.	East Aurora, Mich.

The ground over which this trial was run was a beautiful rolling country, much diversified by lakes, sloughs, timber, open prairie, stubble, grass, meadows, plowed fields and standing sorghum or sugar cane, with scattering dwelling-houses and barns, grain stalks, threshed straw, and shucks too poor in quality to pay for threshing. Both the pinnated grouse or true prairie chicken and the sharp-tailed grouse, (called also pin-tailed, sprig-tailed, or white-breasted grouse,) are found here in considerable abundance. The last named are considered the strongest flyers and the best game bird of the two. At 9:45 in the morning, after considerable delay, the two beautiful setters, Prairie Belle and Nellie, were put down on a broken prairie and cast loose. Prairie Belle is a chestnut and white bitch out of Prairie Ranger, hatched by Bergen-thal's Lake. Nellie is a native red Irish setter puppy, nine months old, and previously tried and proven a good ranger from wagon. They had hardly touched field before both came to point, the white and liver showing some excellent rounding. Red led up and backed, and the points proved true ones. This was a good beginning; but as the wind was very high and the birds wild, and the dogs could not work down wind without a certainty of flushing, the trial proceeded slowly thenceforward. It was fortunate for puppy work, however, that the birds were young. After awhile came a flush for Nellie down wind, and then a point for each against wind. Next a chase for Belle, and a refusal to back by Nellie, and so on, until finally Nellie was taken up at 11 o'clock, having completed her trial in the tolerably short time of 1 hour and 15 minutes, considering the circumstances.

Then Tempest was called. Presently Prairie Belle finished her role, and Strathroy also came to the fore. Tempest is an orange and white native English puppy, seven months old, by Charm-Gypsy; Strathroy, a beautiful black, white and tan, out of the famous Leicester stock of J. H. Smith, of Canada. Tempest found in a swale almost immediately after being put down, dropping in fine style at the rise of the bird. He continued in luck throughout, although a flush soon followed his bit of good fortune while working across a stubble. Strathroy showed excellent qualities throughout in staunchness, quartering, ranging, pace, etc., but he evidently lost his nose somewhere that day, for he flushed more birds, it is claimed by Mr. Sanborn, than in all his life before. He backed Tempest once when there was no bird; he made a false point; he pointed and dropped to wing when off duty, etc. Nevertheless, he wound up his score at the end and retired with two false points and three flushes for demerit. Jennie then came to the fore in place of Lily White, as she and Tempest, being owned by the same person (Mr. Sanborn, of Michigan) could not be run together. Tempest continued to do himself credit, as he had done before dinner, showing fine style, good nose and more good luck, and retired at 5:20, with three points and two flushes.

From the moment the beautiful little Jennie took to her feet she astonished every one by her marvellous speed. She is a regular rattler, and her little white figure, nervous tail, and flying ears, whisk and rattle through the grass in a wonderful manner. She is here, there and everywhere all the time, and can do a fifty-acre field in a jiffy. She is so quick that she is apt to flush while whisking down the wind; but no matter! She quarters like an apple-slicer, drops at sight, and is up and off again in a jiffy. Once, while going at a tremendous pace in stubble, she came to an instant point, and up rose ten good birds in a covey. It was a very long point, and it was delightful to see Tempest back her. (Tempest was running with her at that time). She was everywhere a favorite from start to finish, and when she was taken up about six o'clock, with three flushes and two points, all wondered that she had endured so long.

Lily White was put down about six o'clock, only a few minutes before Jennie retired. Her first exploit was to back her comrade. However, a long point and some very careful drawing redeemed this delinquency, and she was working fairly when the waning daylight required her to desist. She was then taken up with two points to her score and the privilege of being put down after and if any chance to win offered. She drops to shut well, and showed a want of nose in flushing three times. The following is the official scale of points as

tempest was called. Presently Prairie Belle finished her role, and Strathroy also came to the fore. Tempest is an orange and white native English puppy, seven months old, by Charm-Gypsy; Strathroy, a beautiful black, white and tan, out of the famous Leicester stock of J. H. Smith, of Canada. Tempest found in a swale almost immediately after being put down, dropping in fine style at the rise of the bird. He continued in luck throughout, although a flush soon followed his bit of good fortune while working across a stubble. Once, while going at a tremendous pace in stubble, she came to an instant point, and up rose ten good birds in a covey. It was a very long point, and it was delightful to see Tempest back her. (Tempest was running with her at that time). She was everywhere a favorite from start to finish, and when she was taken up about six o'clock, with three flushes and two points, all wondered that she had endured so long.

Lily White was put down about six o'clock, only a few minutes before Jennie retired. Her first exploit was to back her comrade. However, a long point and some very careful drawing redeemed this delinquency, and she was working fairly when the waning daylight required her to desist. She was then taken up with two points to her score and the privilege of being put down after and if any chance to win offered. She drops to shut well, and showed a want of nose in flushing three times. The following is the official scale of points as

given by the judges, Prairie Belle winning first prize and Tempest second:

NAME.	SCALE OF POINTS.										Total.
	Each Point in 5.	Back 10 to 100.	Style 1 to 10.	Quartermaster 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	
Prairie Belle.....	20-4	20-4	20-4	20-4	20-4	20-4	20-4	20-4	20-4	20-4	45 1/2
Nellie.....	15-3	15-3	15-3	15-3	15-3	15-3	15-3	15-3	15-3	15-3	36 1/2
Tempest.....	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	30 1/2
Stratroy.....	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	30 1/2
Lucy White.....	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	30 1/2
Jennie.....	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	10-2	30 1/2

All things considered, the exhibit was most satisfactory, and the spectators were home convinced that they had seen some excellent work for puppies of that age. Sufficient credit, we think, is not given to the infants of the nursery class, for one is apt to forget the youthfulness of the performer, and to judge his performance by the work of old and experienced dogs. The beautiful creatures which it was our privilege to see showed the quality of their breeding, and the advocates of cross breeds will be pleased that both prizes were won by natives crossed by blue blood. We regretted that all the entries were Western, and that none came from east of Michigan.

Among the gentlemen present were Mr. Beaupre, President, and Messrs. Mulliken, Cantwell, Pendergast, Dilley, Davis and Ulme, members of the Kennel Club; Rowe, of Chicago Field; Swainson, of St. Paul; Rea, of St. Paul Pioneer; Rogers, artist for Harper's Weekly; Glidden, of Boston; J. Kellogg, Fish Commissioner of Michigan; Osgood Nichols, of Battle Creek, Michigan; Sanborn, of Michigan; Nelson, of Minnesota; Le Sasser, of New Orleans; Col. Cockrell, of Little Rock, Arkansas; Jones, of Iowa; Stoddard, of Iowa; Whitman, of Chicago; Hopkins Smith, of Maine; Chas. Hallock (FOREST AND STREAM), New York; Dr. Kinney, of Philadelphia; L. B. McFarland, of Tennessee, and in all some fifty representatives from fifteen different States.

Most of the persons named were lodged and admirably fed in some sixteen tents, which had been furnished by mine host, Chas. Benson, of St. Cloud, and most pleasantly located on the bank of Westport Lake, a pellucid body of clear water inhabited by black bass, and bordered by burr-oak groves and a pebbly shore. Two sloughs, connected with the lake, and the ducks flying to and from one body of water to the other, afforded excellent sport in the early morning and evening hours.

By the kind consideration of W. S. Alexander, Esq., freight and ticket agent of the St. Paul and Pacific Railroad, the sportsmen were furnished with round trip tickets from St. Paul to Sauk Centre and return, for \$5 each, and a box car free for dogs, implements, and impedimenta. Westport Lake, where the camp is located, is a fourteen-mile drive from the railroad station at Sauk Centre, over alternate prairie and timber land, and was a treat to those Eastern men who had never gazed on the lands of the Ojibwa and Dacotah before.

Mr. Beaupre, President of the Minnesota Kennel Club, as well as the Directors of the same, were unremitting in their attentions to guests, and the members of the sporting press especially, and all who came will wish to come again, no doubt.

SECOND DAY—Wednesday, September 11.—Weather cool, but sun warm and bright sky from sunrise to sunset. Wind west; a slight frost in the morning.

SECOND TRIAL.

Minnesota Kennel Club Stake for Puppies or Setters Under 15 Months. First prize, \$50; second, \$30; third, \$20. Entrance, \$5.

Entries as Drawn.	Owner.	Residence.
1..... Stratroy.	D. C. Sanborn.	Baltimore, Mich.
2..... Maggie May.	J. H. Whitman.	Chicago.
3..... Queen of the West.	S. J. Jones.	Marshalltown, Iowa.
4..... Jennie.	D. C. Sanborn.	Baltimore, Mich.
5..... Clipper.	J. H. Whitman.	Chicago.
6..... Daggrass.	S. P. French.	Cedar Rapids, Iowa.
7..... Lou.	D. C. Sanborn.	Baltimore, Mich.

Dan to Run a Bye—Judges, Messrs. Davidson, Mulliken and Whitford, as above.

NOTE.—Bluegrass is by Dennith's Dash out of C. F. Stevens' Di. Di: Queen of the West by Barnhard's Flash out of Blackburn's Diamond. Queen of the West was handled by C. F. Stevens, of Nevada, Iowa; Bluegrass was withdrawn, as appears in the report, on account of sore foot and distemper.

Wednesday was all that could be desired, the crowd having been considerably increased by prominent residents of the county (Polk) in which the trials are run, who were in carriages with their families. Scarcely a breath of air stirred. At 8 o'clock the dogs Stratroy and Maggie May were put down in a stubble field a mile from the camp and cast off, with the bright gleaming over the stems of the golden straw where the harvest had ripened.

Stratroy and Maggie May (entries 1 and 2), were put down in stubble at 7:30 a. m. Two covers rose wild and Mag was penalized for a flush. Thence into grass, where Stratroy scored 2 true and 1 false point; thence into the rag weeds (a species of tall weed which springs up on fallow land) where Stratroy scored another point; from thence into the main field of several hundred acres of stubble. Here Stratroy finished, and was taken up at 11:15. Mag meanwhile scored two flushes and two points, retiring at 10:20. Queen of the West then went in (10:20), and between the time when she was put down and taken up for dinner earned 3 true and 1 false point. Queen of the West belonged to Whitman, of Chicago, and was bred by George Waddington, of Iowa. Clipper entered at 11:40, and at dinner time (12:30), had penalized to a false point. Clipper had a pottering gait with ordinary style. Stratroy showed excellent quality throughout and good

style, pointing his birds staunchly, and deservedly earning the first prize which was awarded him. The Queen shows well with Stratroy, and both are dogs which a sportsman would like to own.

Jennie was put down at 11:15, showing wonderful exhibits of speed, style, and all that sort of thing, quartering beautifully, and was taken up at 11:40, having beat a 100 acre field and scored four good flushes in just 25 minutes.

The after-dinner run was not satisfactory, the birds very wild, and the opportunities to score few and far between. Dogs, judges, and spectators returned at a late hour, nearly the whole day having been occupied with the six puppies. Snap and Daisy went on at 6 o'clock, Snap taking a false point, and Daisy a point. Taken up at dark. The following score of points earned will indicate their relative merits as indicated by the trial:

NAME.	SCALE OF POINTS.										Total.
	Each Point in 5.	Back 10 to 100.	Style 1 to 10.	Quartermaster 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	St. 1 to 10.	
Stratroy—1st prize.....	25	3	5	8	4	5	4	4	4	4	46
Maggie May—2d prize.....	20	3	4	4	4	4	4	4	4	4	37 1/2
Queen of West.....	20	3	4	4	4	4	4	4	4	4	37 1/2
Jennie (none run out).....	15	3	4	4	4	4	4	4	4	4	35 1/2

THIRD DAY—Thursday, September 12—C. A. M.—Bright and clear; light wind from southeast; cold, ice forming in pools one-fourth of an inch thick; 9 o'clock, wind south and light 12 m., clear and warm, wind light from south; 5 p. m., clear and windy.

THIRD TRIAL.

Entries for Puppies and Setters of All Ages.

First prize, \$50; second, \$30; third, \$20.	Owner.	Residence.
1..... Soap.	C. N. Nelson.	Sulawesi, Minn.
2..... Daisy.	G. Waddington.	Geneva, Iowa.
3..... Clipper.	C. H. Whitman.	Chicago.
4..... Jennie.	J. H. Sanborn.	Baltimore, Mich.
5..... Friend.	E. F. Stoddard.	Dayton, Ohio.
6..... Queen of the West.	S. S. Jones.	Marshalltown, Iowa.
7..... Ranger.	S. B. Diley.	Lake City, Minn.
8..... Jet.	J. S. Jones.	Marshalltown, Iowa.
9..... Nellie.	C. H. Sanborn.	Baltimore, Mich.
10..... Countess May.	C. H. Whitman.	Chicago.
11..... Countess Loyal.	S. B. Diley.	Lake City, Minn.
12..... Stratroy.	C. H. Sanborn.	Baltimore, Mich.
13..... Jack.	J. H. Hotchkiss.	Hastings, Mich.

Snap and Daisy put down in stubble at 8:20. Snap taken up at 9:25, having concluded her score from Wednesday night with 1 flush and 4 points to her credit, and Jet put down in place of Clipper. Daisy made a point in stubble, and a point and a flush in grass. Jet put in a point in grass. Daisy scores a fine point, and in five minutes afterward another which took her up at 10 a. m. Clipper down at 10:10. Jet scores a second point and then a third, showing fine style and roading. Here Queen of the West was led up to take her privilege on backing to decide second place on puppy stakes, and for a third time refused to back, which refusal gave second prize to Dan, Sanborn's puppy. Clipper now scores a point, and retrieves his bird in fine style. A false point in stubble for Jet. Jet is a fine steady worker, but rather slow, raised in Pennsylvania and Iowa on quail. Again a false point for Jet. No business done for an hour. Then a false point for Jet (12:15), and directly afterward a fine point for a finish, and take up. At 12:20 Jennie put down. At 12:25 a bird up and a penalty for a flush for Jennie, and a chase for Clipper. A little later a false point for Jennie. At 1:50 adjourned for dinner.

The Minnesota boys, the old hunters, rough-riders and big luns of the "water and smoke country" seem somewhat disappointed with the Field Trials. They supposed that the dogs were to be run in the same style as they are ordinarily run on a chicken hunt; that is, they were to "skin out" over the rolling prairie, find and point, while the sportsmen remained in their hunting wagons, following the dogs until it was time to light and get down on the covey with their guns. On the field trials, as imported from the East, they "allow" that the breakers and handlers work and find for the dogs, which is decidedly *vice versa*. The handlers of the dogs on trial lead the dogs in leash out upon what appears to be good chicken ground, and then cast off, and the dogs begin to work. The three judges, flag-bearer, and reporters follow closely on foot, or in wagon, if long distances occur between the proper localities for hunting, and the retinue of spectators follow after in wagons and on foot, "at least 75 yards from the judges," as the regulation requires. Then the propensities of the dog on trial are closely scanned, and if his tail stiffens perceptibly it is a "sign." Should a bird get up, a point is scored; if not, a demerit is scored, and the dog is penalized for a defective nose. Generally the birds are in coveys or in packs (a pack is a large gang), and if not wild, get up singly, and in twos or threes, at considerable intervals of time, so that a dog has sometimes an opportunity to score his five points very soon. If the birds are wild, often a whole day is required. There are besides these points, points of merit and demerit, and it depends upon how a dog quarters, roads, or trails, winds, drops, or whether he runs wild, chases a bird, flushes, etc., whether he is adjudged to be a good dog—in the opinion of the judges. Of course the owners and handlers *always* differ, if a dog fails to make his score, because he always works better on real business. He is not surrounded by a posse of wagons and men, and distracted by his master slowing him up to a funk bird by the tail, even if he be a puppy (puppies are not entered on field trials wholly green). He usually hears a gun shot when a bird rises, if not he considers his labor wasted and takes to heel, or puts out for home. He does not understand why he hears no gun go off,

sees no birds drop, and is never called upon to seek down and fetch. Like the new convert he may think well of the efficacy of silent prayer, but he has better belief in the loud amen. For these and many other reasons best understood by experienced hunters, and mentioned here only for benefit of the uninitiated, the old hunters of Minnesota, as we have remarked, are rather inclined to look upon these field trials as popinjay affairs, which may do very well for the East, but are of no account on these "perairies," and so, after the first day satisfied their curiosity, they began to branch off in all directions with their "outfits" (and some of them are certainly most completely "heeled," and bring back wagon loads of ducks and chickens, with an occasional hawk or owl plucked at long range from the wagon on a jump. By the way, hawks are very often killed because they kill so many chickens. It is surprising what big bags these rough-riders do bring! There is old Cal. Ulme, the brave Colquhoun of the 2d Minnesota, Col. Pendergast, with his prairie schooner, Col. S. L. Davis, Big John Neilson, and all that crown. M. Beaupre, the President of the Club, bestows some considerable attention to the trials by virtue of his office and proper courtesy to the managers of the field trials, but he frequently drops out with Sol, or some other one of the crowd, and goes off to the "slews" and ridges, and brings home a box load of trophies.

With the Ohio, Indiana, and Michigan men, the field trials are more appreciated; and perhaps one of these days we shall have rules and trials adapted not only to America's requirements but to the different wide sections of America. As at present formed, the rules are too limited for our Minnesota scope of country; and so, perhaps, we shall continue to hear many expressions of dissatisfaction from various quarters until the result of wisdom manifests itself. And this is about all the comment I can make upon the Minnesota Field Trials. It was my first intention to describe the maneuvers (work) of the dogs in dog vernacular, from the moment they were put down and cast off adieu until taken up at the end of the run—that is, to use only the flash terms of the kennel glossary, but I shall rest here, and leave this duty to others to whom they are more familiar.

IN THE NEW YORK DOG POUND.

IN our issue of last week there appeared a short paragraph in regard to the dog pound in New York. These few lines attracted the attention of a correspondent in Boston, who in a most pleasant letter threw himself on our sympathies, requesting us to go to the pound and select a dog for him. The margin of choice was ample, "a young dog, Scotch or Skye terrier, spaiel or pointer—such a dog was to be saved from an ignoble death, and would be provided with a good home and good treatment—the children were to play with him."

The letter touched us from the kindly feeling it displayed, and yesterday we made a pilgrimage to the dog Golgotha. The New York dog pound is situated at the foot of Sixteenth street and the East River. You approach it through the extensive works of a gas company, huge piles of coal towering upon both sides of the street give the no-thoroughfare a possibly sinister appearance, great big iron cars rush automatically overhead through the air, suspended in ropes, and dump their black contents in a wet way, with a noise like thunder. As we went our way along the street we can see, however, that sympathies for the poor brutes are quite evident. Here come a couple of German women, their broad faces beaming with smiles. Not less gleeful is a third personage, quite a fair black and tan terrier, who, attached by a chain, is an important factor in the group. That dog has been saved. He seems to appreciate the situation. He does not tug on the chain, but walks along happily but not boisterously. Occasionally he turns around and gives his mistress a thankful look with his hazel eyes. His coat is filthy, he has been thrown in with all the mean, low-down curs that the city vomits into the pound. When he gets home he will, we trust, be washed and cleansed, and will be kept from straying. It has cost these poor Germans, for they are working people, three dollars to save their dog from a watery grave. Another party follows, Germans again, for it is a neighborhood of Teutons. This time their pet has not been found. They gesticulate. The man looks in an agony of grief, and the women are crying. We came at last to a low building on which there jutted out into the street a wooden sign, with the ominous words painted on it "Dog Pound." Before us trips a comely girl of seventeen. She has a basket on her arm. We enter with her. "Oh, sir," she says to a guardian, "such a pretty dog, mother can't come. The loss of our poor Minna has made her sick. Can't I go in and look for Minna? She is small—and so pretty—and is black, with gray hair—and she has no hair on the top of her head (we repress the irreverent inclination to add "in the place where the hair ought to grow," and she has been lost since this morning." The poor girl showed her love for the little doggy in her face.

"Come in the pound and you can see," replies the dog-pound master unmoved, and on this we both enter. The place is not a savory one. It is disgusting, as to odors, enough to make one sick. The smallest quantity of some disinfecting fluid might be used to the greatest advantage, and we can see no reason why the city authorities do not provide it. The kennel was, however, fairly clean. Where there are many dogs there is much yelping, for dogs like yelping in dog shows or in dog pounds. But this

yelping had a different sound. It was a piteous cry, one of canine grief and agony. The room is divided into kennels of convenient size. On the left side of the building is a long alley, where miscellaneous dogs are luddled together. Such a wretched, miserable assemblage of dogs, with one single exception, we never saw. Off crosses from spitz dogs predominated: some few were fat and gross, but the majority were lean and miserable; innumerable poor brutes were mangy. As we mounted on a kennel overlooking the motley assemblage, contemptible as were the dogs as to breed, a feeling of pity was uppermost in our mind. As we gazed on them, many a poor wistful pair of eyes were turned on us. Inquisitive, far, deep seeking eyes were they, which seemed to say, "For pity's sake, keep us from death! Are you my master? No, you are not; but for goodness sake find my owner, and tell him what a sorry plight I am in; and bid him come—quick, quick—and save me." There is a joyful cry from the young girl along side of us, who has climbed on the top of a kennel. "There is Mina—our Mina! There, there—get her quick! Poor old thing." We see a miserable cur on which the pretty girl's affections are centered, and a little trembling brute is fished out by an attendant, who delivers it to the girl, who puts the dazed Mina into her basket. The dog is mangy, not worth three cents, but the pretty girl would not take a thousand dollars for it. Since the dog is then saved, we volunteer to the comely lass some advice as to how Mina's mange is to be cured, and, with a winning smile, the girl trips away to the clerk's office, where she pays her three dollars (may be the money she had saved to buy her a new dress) and then she goes on her way rejoicing. With a really saddened heart we look again at the dogs. There is but one animal worth anything, and that is a spotted coach dog. But he shows age, and is possibly eight or ten years old. There are fully 300 dogs in the house. We ask how many are redeemed, and are told but a very small percentage. Dogs remain in durance forty-eight hours, then if not reclaimed are drowned. We look at the instrument of death—an iron cage hung from a crane, which can be swung into the river and then lowered, and we thought it a merciful way of concluding the sad business. The cage fits exactly into one of the long alleys, and one side being opened, the dogs are swept into it, and thus go to their long home. Of course the man with the flintiest heart must have some sympathy for these poor brutes. Still ninety-nine one-hundredths of them are perfectly worthless creatures and encumber the earth. We found no dog which we could save from death, and our errand of mercy, we regret to say, came to naught.

MORE CURRENT JOTTINGS BY A STRAY DOG.

IT'S a poor dog that cannot wash his own tail....Every well ordered kennel should have a bay window and a Skye-parlor....There is a dog, "out West," who keeps his master's household supplied with fish. Thrifty pickering in one day is a fair average catch for him. He came originally from Terra del Fuego, where the people live almost exclusively upon what they can fish up out of the sea. The dogs are taught to bark and flounder about in the bays and creeks, thus driving the fish into shallow water to be caught by the fair Fuzgen maidens....Scotch dogs are very moral canines. No Newfoundland dog trainer "need apply whose ability and character will not bear the strictest inquiry"...."Tis sweet to hear the watch-dog's honest bark bay deep-mouthed welcome as we draw near home." Byron never had his pants mutilated as he was climbing over the back fence or he would not have written that....Correct information wanted concerning Bismarck dog Sultan. There are two stories current at present:

Last year, when Bismarck's favorite dog, Sultan, was dying, he watched beside the poor animal with such manifestly deep sorrow that Count Herbert, the Prince's eldest son, at last endeavored to get his father away. The Prince took a few steps toward the dog, but on looking back, his eyes met those of his old friend. "No, leave me alone," he said, and he returned to poor Sultan. When the dog was dead, Bismarck turned to a friend who was standing near, and said: "Those old German forefathers of ours had a kind religion. They believed that, after death, they would meet again in the celestial hunting grounds all the good dogs that had been their faithful companions in life. I wish I could believe that." Bismarck's love for his dogs can be traced back to his earliest youth, and a little boy does not in the least resemble the commonplace liking most people are able to feel for some pet animal. It is a real affection, deeply rooted in his large heart. Very fine. The other story goes:

Bismarck, at last accounts, intended parting with his big dog Sultan. The animal, while devouring his ration of meat, was troubled by a bone in his throat, which seemed to give him pain. The Princess Bismarck immediately began slapping the dog's neck in order to facilitate the passage of the bone, but Sultan, being very much out of humor, and not understanding the demonstration, rushed at his mistress and knocked her down. The bone disabled him from biting, or she might have been much hurt. So long as Sultan bit the servants or strangers Bismarck had no fault to find, but an attack upon a member of his own family necessitated the banishment of his trusty companion and protector.

This Sultan has or had, it will be remembered, very strong religious and political prejudices. Here is another dog who has antipathies:

Monsieur Capel, whose portrait is drawn in "Lothian" under the title of Monsieur Catesby, was a Catholic dog, to whom Charles Warren Stoddard was recently introduced at Cedar Villa, the former home of Mr. Stoddard. When the San Francisco traveler was formally presented Beppo put out a paw and saluted the visitor with a short, low bark. "Beppo,"

said Monsieur, "here is a mouthful with the compliments of Bismarck." A huge bit of cake was placed under the nose of the dog, who refused even to look at it. Being urged to eat it, he turned away and retreated in the deepest disgust. "The Pope sends it," cried Beppo's master, and the words were scarcely uttered when the cake disappeared in a flash. "These cheers for the Pope," cried the host. Beppo sprang to a table under a fine portrait of the Pope, put his forepaws upon it and barked thrice with enthusiasm. Nor would the dog, who bore upon his collar this legend, "Beppo, Friend and Protector," quit the room, although ordered to do so, until Monsieur had passed out before him.

The fine large Newfoundland dog of the well-known grocer of Mamaronock, being stung by the wasps, sought him out the abutment of a railroad bridge, whence he plunged in, shoved his nose under the water and died. So perished the "valuable and intelligent" Newfoundland of the well-known grocer of Mamaronock....The meanest dog that ever walked on four legs knows the difference between a dog and a rabbit. That's more than some men know:

In England, the other day, a lecturer on natural history was called upon to pay for a live rabbit which he had in a basket in a railway carriage, and which the ticket collector said would be charged the same as a dog. The lecturer vainly explained that he was going to use the rabbit in illustration of a lecture he was about to give in a provincial town, and, indignantly taking a small live tortoise from his pocket, said, "You'll be telling me next that this is a dog, and that I must pay for it also." The ticket-taker went for superior orders, and on his return delivered this lecture on natural history: "Cats is dogs, rabbits is dogs, but a tortois is a hinsect." The professor had to pay dog fare for the rabbit.

WHAT A DOG IS WORTH.—*Huntingdon, Tenn., Sept. 9.*—*Editor Forest and Stream:* A dog case was tried in the Circuit Court at Huntingdon on the 6th inst., which developed the following facts: On the 21st of December, 1877, a brass band wagon had been perambulating the streets of the town. Manuel Hampton, a colored man, was driving. He was the owner of a yellow cur dog which was playfully running around after the band. As the band was returning to Court Square, Hampton got out and passed through the courtyard. As he passed in at the south gate his dog likewise passed in, and the gate closed behind them. Hampton moved in, and passed out at the north gate, the gate closing behind him, leaving the dog on the inner side. He paid no further attention to his dog until he discovered him in the agonies of death. The proof disclosed that between the gate post and the fence there was a crack, narrow at the bottom and inclining to the top. One of the witnesses discovered the dog hanging in the crack in a precarious condition, and called to E. Strange, a saloon-keeper, to go and "get his dog." It was, perhaps, five minutes before Strange went to his relief. He states "that he was hanging by the neck, and that he raised him up, and let him fall on the inner side of the fence." The dog for a time appeared lifeless, but soon commenced to kick and foam at the mouth, and to bite at the ground. A witness had never seen a mad dog, but supposed he acted like a mad dog. Several parties came up, and the cry of "mad dog" was raised, and the Town Marshal was called for. He soon came, and, upon the advice of the by-standers, shot the dog. A man then handed him a billet of wood, with which he finished him. This man testified that he had seen several dogs with rabies, and that the dog in question appeared to be affected as they were. He said that he had seen him attack a mad dog, such dogs would be worth about one dollar and a half." On cross-examination he testified that he had neither bought nor sold a car-load of dogs, and did not know how many it would take to make a car-load, and could not state if a car-load would be worth \$1.50, what one dog would be worth. G. C. Giles first saw the dog in the dilemma, and was the man that called Strange to relieve him, though he thought the dog was fastened just back of the thresholds. His testimony hardly materially differ from Strange's statement as to the action of the dog after he had been loosened. The other witnesses testified that they saw the dog, and thought that he was mad. Licurgus McCracken testified that he lived near Hampton's house, and knew the dog. He was accustomed to go with and take care of Hampton's children. He would bark at people passing by, but he had never seen him attack people in the alley near the house, but had never known him to bite any one. He was worth ten dollars. Hampton testified that his dog was valuable; there was nothing the matter with him that evening; his peculiar action was only caused by reason of his being choked down. The dog was worth twenty-five dollars, though he would not have had him killed for any amount of money. The counsel for the prosecution introduced as a witness Attorney-General R. A. Pierce, who testified that he was somewhat of a dog man and knew something of the worth of dogs. He placed the value of good dogs as ranging from fifty dollars to one thousand dollars. The dog in controversy was not of his kind of dog, though he was brought up on a farm and knew our dogs to be very valuable to a farmer. If this dog had been taught to mind the children of Hampton, and did so, he was a very valuable dog and would be worth a considerable sum of money to the owner. The evidence of the value of the dog was voluminous and variable. His Honor Judge Ayres charged the jury: "That a right of property in dogs was settled question in Tennessee. That if the proof established that Christenberry had killed Hampton's dog, and should then stop, Hampton would be entitled to recover in damages the worth of the dog, whatever the proof might show that to be. But the plea of justification was admissible, and if it appeared from the proof that the dog had been, or that he was, vicious or dangerous, and in the habit of biting people on the street, then the defendant was justified in killing him, and the plaintiff could not recover damages." The jury retired, and, after deliberation, returned a verdict in favor of the plaintiff for ten dollars. This verdict carried with it the cost of suit, which will probably reach fifty dollars. A motion for a new trial was ably argued by counsel for the defendant, which was by the court overruled. His Honor stated that the issue had been submitted to a jury in a charge of which the defendant could not complain, and that under the circumstances he did not feel justified in disturbing their verdict.

H.

WARTS ON POPPIES.—A correspondent, "S. H.," writes us as follows: Somebody has asked you how to cure warts on a puppy's lips. My puppy, at the age of nine months, had about half a dozen, that was two months ago, and they have now come

off entirely, although I did nothing to them. I advise him not to trouble himself about them.

We have known warts to disappear of their own accord in time, but this is not always the case, and sometimes caustic is necessary.

NAMES CLAIMED.—Mr. C. J. Stoddard, of Washington, D. C., claims the name of Grand Duddess for his Gordon bitch out of Malcomb's Malcomb and Bothchelder's Bella. Whelped May 10.

"ROZE."—The name claimed for Mr. O. L. Whitman, of Detroit, for his liver and white bitch mentioned in our last issue, should have been Roze, and not Rose.

—Mr. H. P. Doitch, of Goldsboro, N. C., claims the following names for the pups whelped by his red Irish bitch, Gussie, out of Tate & Hobart's Gie, July 28, 1878: Sam Royall, property of J. F. Doitch, Goldsboro, N. C.; Dan No., property of Capt. Sam Hodges Portsmouth, Va.; Shot No., property of Arnold Borden, Goldsboro, N. C.; Doitch, property of T. D. Gillespie, Columbia, S. C.; Pansy (bitch), property of H. P. Doitch, Goldsboro.

VISITS.—Will, first prize pup at the N. Y. Bench Show, 1878, the property of E. F. Mercilliot, 186 Broome street, N. Y., served the celebrated bitch, Julia, the property of E. E. Hale, both red and white native English.

—Pet, E. F. Mercilliot's native English setter bitch, visited Theo Morford's Don, at Newton, N. J., Aug. 23, 1878.

THE EASTERN YACHT CLUB.

BOSTON, Sept. 13, 1878.

EDITOR FOREST AND STREAM:

The fall regatta of the Eastern Yacht Club came off on the 11th, after being postponed from the 4th, on account of an easterly storm. The morning was hazy, with a light air from the E. N. E., which strengthened as the day went on, and it blew hard in the afternoon. There was a good show of yachts at the start. The *Halcyon* did not put in appearance as expected, much to the disappointment of the *Foam* and *America*, especially the latter, as her sailing master says the owner of the *Halcyon* has made statements concerning the sailing of his boat and the *America* which are not correct, and he was there ready to sail with him and prove them so. Considerable curiosity was aroused on the judges' boat before the start by an ensign displayed in the main rigging of the *Brenda*. It was found, however, as she drew up across the line that she had no member on board, the rules of the club requiring that a competing yacht should have such a one on board. After a short deliberation she was sent on her way, but could not have taken any prize had she won it. The start was as follows:

FIRST-CLASS SCHOONERS.

Names.	Owners.	Length.	n. m. s.
Magie.....	J. Spaulding.....	51 03	11 07 50
Foam.....	T. B. Peckham.....	51 00	11 08 36
Rebecca.....	C. H. Joy.....	60 75	11 10 20
Brenda.....	J. L. Little.....	61 02	11 10 00

SECOND-CLASS SCHOONERS.

Fearless.....	E. B. Phillips.....	54 15	11 13 57
Latona.....	D. P. Pickett.....	55 00	11 14 04
Anna.....	David Piquette.....	47 00	11 13 42
Dream.....	G. S. Curtis.....	43 00	11 10 00

SMALL-CLASS SCHOONERS.

Shadow.....	John Hyman.....	33 50	11 14 45
White Cap.....	J. M. Forbes.....	35 00	11 15 50

The *Magie* was the first to cross the line, and was closely followed by the *Foam*. The race really in the first-class centered in these two, and they hung on to each other all through the day, there only being five minutes difference between them at the end of the race, by actual time, making a gain of three minutes for the *Magie*. The thrash down to Half Rock was done in the same order as above, but in the long run across to Harding's Ledge, before the wind, there was a slight change. The *Fearless*, which had gained on the big schooners in the beat down, held her own. The *Rebecca*, *Latona*, *White Cap* and *Brenda* closed up the gap considerably. The latter schooner made fine sailing here and passed *White Cap* and *Latona*, and closed on *Rebecca*. The latter, however, started two staysails, one above the other, which, according to the rules of the club, would rule her out of the race had any one protested. In rounding Harding *Magie*, *Foam* and *Fearless* were close together, but on the thrash back *Magie* proved too much for *Foam* and came in leading boat. *Rebecca* and *Brenda* rounded neck and neck, but the former gained on the latter on the way home, as the wind was heavier for the smaller schooner. They were followed by *Latona*, *Shadow*, *White Cap* and *Dream*, the latter giving up here as she had not rounded Halfway Rock, and had been virtually out of the race for some time. The actual and corrected times are given as follows:

Yacht.	Act. time.	Cor. time.
Magie.....	4 48 30	4 37 35
Foam.....	4 53 18	4 42 16
Brenda.....	5 08 53	4 58 23
Rebecca.....	5 05 15	4 48 37
Latona.....	4 55 15	4 44 16
Dream.....	Gave up.	
Anna.....	5 15 37	5 09 17
Shadow.....	5 29 46	5 20 31
White Cap.....	5 20 21	5 20 21

Mangle takes first money for first-class schooners, *Fearless* for second-class schooners, and *Shadow* for second-class sloops. *Foam* and *Leisea* had a private flag up between them, *Foam* giving her rival twenty minutes allowance. *Rebecca* takes the prize if the owner of *Foam* makes no objection to her having carried two stayalls. The steamer *Governor Andrew* was on hand, but the day was not one for ladies, and there were but few people on board. The *Feder B. Bradley* was used for the judges, who were as follows: Messrs. W. M. Whitney, John Jeffries, R. H. Stevenson and George A. Giddard. As neither *Wayward* nor *Enterprise* put in an appearance there was no race for first-class sloops.

CRUIZERS.

YACHTING NEWS.

SAN FRANCISCO YACHT CLUB.—The life lately infused into this organization seems to be of a lasting character, and the amateurs of the Golden Gate have exhibited good staying qualities. Squadron cruises follow each other in rapid succession, and the amount of actual sailing put in by the members will compare favorably with anything we do in the East. *Clara*, a New York model, and *Emerald*, built at San Francisco, are likely to be matched. Our friends out there claim—and we think justly so—that the skimming dish craft of Eastern waters are no match for the more powerful model in vogue among builders of the Pacific coast—at least, not in the still breezes and lumpy water they have out there. So far, we believe, *Clara* has not shown herself equal to the large displacement yachts native to California waters.

CHICAGO YACHT CLUB.—This club called its annual regatta on Lake Michigan, September 6 and 7. Course for first class, around the "crib" and return. Won by *Cora* in 4h. 29m. 16s., beating *Greyhound*. In second class, *Ina* had a walk-over. In third class, *Peri* won in 4h. 16m. 45s., beating *Goodenough*, *Karus*, *Southwind*, *Zephyr*, *No-name*, and *Sym-latski*. In fourth class, course twelve miles to windward and return. *Harus* won, beating *No-name*, *Plebeian*, *Fanchon*, *Leila*, *Zephyr*, *Mischief* and *Undine*. A skill race followed won by *American Girl* in 1h. 36m. 55s., over a five-mile course.

OAR AND PADDLE.

THE RASIN RIVER NAVY.

The Rasin River Navy held its fourth annual regatta on this historic stream on the 5th, and it proved a pleasant and enjoyable affair. The navy is composed of the Floral City, Amateur and Shoe-wax-cette boat clubs, who own about twelve boats, four and six-oars, single and double-sculls, and one eight-oared barge. Boating on the Rasin has not been extensively indulged in as a pastime previous to five years ago. Not until four years ago have any of the clubs attained any prominence as racing organizations. The first victory was by Shoe-wax-cettes in 1884, at Toledo, in a regatta of the N. A. R. A., when they not only attracted attention by this victory, but by their extraordinary style of rowing, which soon became the butt of all sporting editors and correspondents. They have since, as all the world knows, compelled, by their wonderful progress in style and speed, universal admiration wherever rowing is followed.

The success of this crew, no doubt, had much to do with the increased interest and enthusiasm in other members of the navy, and practice among them all was lively, and many subsequent successes, not least that of Bowlsby at Newark, on the Passaic, has entitled Monroe to a claim of being one of the prominent boating centres of the country. The last regatta, that of yesterday, was not intended to be projected as an affair of general importance, though invitations to few clubs were issued to join them in a social and friendly meeting here at their home. The Centennials of Detroit; Wyandotte, of Wyandottill, and Undines, of Toledo, responded with some of their best oarsmen, and full turnouts by Monroe clubs made a most respectable showing.

This river is wide enough at the point where the regatta took place to allow of big crews to row safely, but the water is always smooth, and the course a good one, with the exception of one rather sharp bend, which, a half mile down stream, shuts off the view from the grand stand. The attendance yesterday was very large, fully 2,000 people witnessing the races, who represented the very best of Monroe's excellent people, with some liberal sprinkling from Detroit, Toledo, Adrian, Saginaw, and smaller nearby towns.

The first race for four-oared shells. Entries: Floral City of Monroe—Crew: Fred G. Bulkley, G. S. Willets, Jas. F. Grant, J. C. Sterling. Undines, of Toledo—Crew: J. G. Kane, J. W. Hickman, J. T. Marrow, E. J. Standard. Centennials, of Detroit—Crew: J. C. Possilius, J. Schafer, A. Stegmeyer, P. Keeler. Amateurs, of Monroe—Crew: J. Durell, A. V. Diefenbaugh, A. O'Reilly, G. W. Bowlsby. Course one mile and return and six-oared shells, and one-oared mile and return. The first trial heat was between the Florals and Undines. This was a closely contested race, and though not very fast time was made, owing to a mistake in getting out of the course by the Undines it was an interesting contest; and won by the Florals in 14m. 44s.; time of the Undines, 16m. The next heat was between the Centennials and Amateurs.

This race bid fair to be exceedingly interesting, the start being even and the first half mile well contested and exciting. At the "canal" the Centennials led and were out in the stream to clear the return, forcing off the amateurs who damaged their steering apparatus and gave up the race. They claimed no foul, the Centennials being in their own water. The Centennials rounded the stake and kept on at their usual speed, reaching the winning line in 14:47.

Although two other races intervened before the final heat was rowed, the result of that contest between the Centennials and Floral City is given here. Their start was very fair, but on the way down the Florals showed bad steering. The Centennials reached their stake first, and were almost around before the others came up. At that moment the Floral City held with their port oars, the Centennials did likewise, but the radius of the circle described by the respective boats overlapped and the Centennials ran the bow of their boat over upon the quarter of the Floral City's shell, sliding up and over-riding it. They hung together; one backed water, the other pulled ahead, and after a minute or two the boats were cleared. Judges Soper and Calloun, who were close by on the steam yacht *Perkins*, agreed that there was technically no foul, each boat being within its own proper course. The Centennials then started a wide and hard, but to work for it, rowing at times forty-six strokes to the minute, while their competitors pulled forty-four. The Centennials came in first in 14:10, winning the heat and the prize. The Floral City crew capsized just as they came opposite the grand stand.

The race for single sculls, one-half mile and return, was

between G. W. Bowlsby, of Monroe, the young rower who won such laurels on the Passaic recently, and Mr. Van Nie man, of Toledo, who, simply to make a race, undertook to pull as a substitute for H. B. Taylor. Bowlsby made the mile in 9:36 without the least pretense of exerting himself. He is a fine oarsman, and all present would have been glad had he worked for a good time record.

The double scull race, one-half mile and return, was between S. J. Lawrence and H. W. Stone, of the Wyandotte crew, and H. B. Taylor and J. G. Kane, of the Undines. Nothing particularly distinguished it, except the poor steering and worse turn of the Undines, who, when at the lower stake, lost considerable starting time, and finally abandoned the contest. The race was awarded to the Wyandotte crew in 7:00. The six-oared crew, with Bowlsby substituted for Joseph Nadeau, presented a fine appearance, and show a much more finished style of rowing than formerly characterized them. The mile was made in 6:30.

The six-oared shell race, one mile and return, was between the Undine crew, of Toledo, Taylor, Hepburn, Standard, Merrill, Acklin and Kane, and the Floral City crew, Bulkley, Willits, A. Grant, Wing, J. F. Grant and Sterling. The race was a perfectly level one, the Floral City crew, characterized by good steering and more equality between the crews. The Floral City crew won in 13:33.

The day's sports concluded with a working boat race of one mile, in which Lazette and Vinier were the winners in eleven minutes, and a tub-race between two lads, won by Frederick Rochester.

In the evening a reception was held at the hotel, the speakers were the Mayor, a purse of about \$400 was presented to the Sho-wax-cette crew. The prizes were also presented to the winning crews for all: Centennials, four-oared shells, silver ice pitcher; Wyandottes' pair, silver goblet; Floral City, silver water service. The following are the officers having charge of the regatta: Commodore, W. P. Sterling; Vice-Commodore, Moses Nadeau; Signal Officer, W. C. Sterling; Judges, H. J. Soper, Detroit; W. B. Calloun, East Saginaw; Starter, Joseph Nadeau; Timekeeper, E. H. Conant; M. A. Noble, Monroe; Referee, E. D. Price, Detroit.

Monroe, Mich., Sept. 6.

THE "EXILES" OF FAIRMOUNT.—St. Paul, Minn., Sept. 10.—One of the most interesting events which occurred here during the Fair week was the entertainment given to the "Exile" boat crew by the Minnesota Boat Club, of St. Paul, consisting of a series of aquatic contests and a dinner. The Exiles are a set of exiles, whose fate is the saddest, most of whom have been settled at Fairmount for the past four years. They are enthusiastic sportsmen, and contributed greatly to the various attractions of the Fair by their hurdle races, fox-chases, jack rabbit coursing and other field sports more common in England than America, appearing on the field en *grande tenue*, in full panoply of boots, spurs, breeches, etc. One of the most prominent of these gentlemen is S. Colquhoun, of Dunbartonshire, Scotland, whose father is the Earl of Eglinton, and has many of the finest estates in Scotland. They are familiar works on field sports. The Minnesota Boat Club comprises some fifty members, selected from among the best citizens of St. Paul, many of whom are college graduates. They own, individually and collectively, some twenty barges and shells, and occupy a commodious and very charmingly located house on an island in the Mississippi River, upon which race boats of all kinds are housed in the club's shed, with West St. Paul. The view from the club house grounds is very romantic, while from the centre of the lofty bridge above it is far reaching, and commands the entire distance of the course run by competing boats. The leading aquatic event was a race between a select four of the Exiles and a picked four of the Minnesota Club. The latter won easily in 13m. 18s., and having no other contests to run, the English rowers were unfamiliar with the current. The names of Exiles were: G. Sharpe, stroke; C. Sharpe, A. Lyon, S. Colquhoun, bow. Of the Minnesotas, F. B. Jilson, C. P. Marvin, W. H. Hyndman, H. M. Butler. A race between two four-oared boats of the club followed. At 9 a. m. the Exiles and a number of strangers, including the writer, were most agreeably entertained at supper, with the usual toasts and excellent refreshments, which closed the day. The club was founded in 1871. May success attend it.

COURTNEY HANLAN.—The latest hitch in the attempt to bring these two oarsmen together has luckily been brought to a successful understanding. The race over the Lachine course, near Montreal, is to be for the championship of America after all, and on this condition the money for the event will be subscribed by the citizens of that place. Courtney does not much fancy the idea of pulling in a match in which the loser is to receive a cinder, but seems to have finally consented to the arrangement, as it was high time he accepted some sort of terms. The Lachine course is not very suitable for the event, as the water is liable to be rough, especially so in October; and the point made that Hanlan is more at home in a lop than Courtney is worthy of consideration to those proposing to invest upon the result. Sir Hugh Allen is chairman of the Citizens' Committee who are to manage the affair in Montreal. We are inclined to consider both men pretty well matched in the coming race, with the odds slightly in favor of Hanlan, owing to his familiarity with rough-water pulling, and Courtney's recent illness, which seems to be more or less chronic. Both oarsmen will use cedar boats, by Judge Elliott, of Greenpoint, L. I. Hanlan has had two ships built, one 30ft. 9in. long, 10½in. wide, and 6½in. deep, weight 80 lbs., the other 30ft. long, 11½in. wide, and 5½in. deep. He will fly both, and select the one he fancies best. Should the water be rough, he will pull in the shorter and wider of the two. Courtney's craft has been sent on to Auburn. It is 30ft. long, 11½in. wide, and 5½in. deep, weight 80 lbs. Rules of the N. A. A. O. will be observed. Coaching prohibited. Referee, James Harding, Esq., of St. John, N. B.

CRESCENT BOAT CLUB OF NEWARK.—This is the name of a new organization, brought to life through the recent regatta of the National Association being held on the Passaic. A pity the members could not have selected a name not quite so hacknosed, and one more appropriate. The club held its first annual regatta on the Passaic, Sept. 9. First heat, single sculls, won by H. Miller in 16m. 20s., beating R. A. Learned. Second heat, won by D. Demarest in 16m, beating E. C. Nichols. Final heat won by Miller. Double scull race, first heat, won by H. Miller and A. Learned in 10m. 55s., beating J. Butterfield and E. Nichols. Second heat, won by E. C. Nichols and E. Clarence. Third heat, D. Demarest and W. Breath. Final heat, won by Miller and Learned in 10m. 50s. W. B. Russell, judge; T. D. Palmer, referee, and R. K. Clark, timekeeper.

"I."—In a private letter to a friend, President White, of Cornell University, speaking of American successes at the Paris Exposition, says: "In regard to several exhibits, they the presidents of the class juries presented their reports, they

went into exclamations of surprise over the recent revelations of American energy and industry. One of them especially declared that if America went on as she at present is going, in regard to the paper manufacture, she would soon have control of the European markets, instancing more particularly the new applications of this industry in the United States. I only wish we could have had one of those paper boats present, such as that in which our Cornell boys beat Harvard the other day. That would have completed the tableau." Exactly, if Americans only knew enough to push their wares in foreign climes, including paper boats, dull times would soon cease altogether. There is a vast field for paper boats abroad, and if Messrs. Waters & Sons, the sole owners of the patents under which such boats are manufactured, are themselves so busy with American orders that they must turn away customers from their doors, why not make arrangements with pure and simple Americans to take the process of manufacture too much wrapped up in ourselves altogether. We hide our light under a bushel. Paper boats, which have come into such general use in this country, are as yet hardly known to exist abroad, and it was only recently that some of our English cousins went into raptures over the old-dug out of the Shoes at Henley. What would they say to one of Waters' latest ships?

LAKE HOPATONG ROWING.—In the double scull race for the championship of Lake Hopatong, N. J., rowed September 7, J. M. Moore and N. Murphy, of Newark, 4½h., beating J. M. Gileudy and Z. Lozier and E. Barnes and H. C. Speddy.

RACING ON THE PASSAIC.—James McClintchy, of Newark, defeated Michael Feely, of Jersey City, over a three mile and a half course, on the Passaic River, Sept. 7. Time, 23m.

RELIEF FOR THE SOUTH.—The Mystic Boat Club, of Newark, has sent the sum of \$50 to the relief fund for the South, an example which might well be followed by all other organizations.

TERRIBLE DEARTH OF NAMES.—Another Columbia Boat Club has sprung up, this time in Sacramento. When people are using over and over again such well worn and dried names as Arlies, Excelsiors, Columbias, Undines, etc? It is expensuring to see so little taste or sense displayed in the selection of club titles.

CONOR RACE AT CHICAGO.—We have to record the first canoe race of the season. It was held at Chicago in connection with the yacht club regatta, Sept. 6 and 7, was paddled in open canoes, mostly brick bark, with single-bladed paddles. Course, one-quarter of a mile and return. Won by Mr. Heissler.

ROWING RIPPLES.

American Boat Club held a race for double-sculls Sept. 8, foot of Fifty-seventh Street, East River. Course, two miles. Entries: T. Heney, bow, J. Powers, stroke; J. Gallagher, bow, A. Keck, stroke. Won by former in 16m. 2½s. A ten-oared barge race took place at Detroit, Sept. 7, in consequence of a challenge issued subsequent to the Detroit River Navy's Regatta. Entries: Walworth Boat Club, of Philadelphia, hold a regatta, open to all Schuylkill clubs, Sept. 23. Race between Ward Brothers and Faulkner-Regan crew is off, Gill Ward being skipper. The Nonpareils, composed of printers, held their regatta on the Harlem, Sept. 11. Single-sculls won by J. B. Couch in 7m. 55s.; Junior pair-oared gigs, won by Martin Green in 7m. 83s.; Senior pair-oared gigs, won by Masters' Crew in 7m. 3s. Walworth Boat Club followed. Davis and Regan, of Boston, will pull a four-mile race at Silver Lake, Oct. 8. Dauntless Boat Club regatta is on the 15th prox. Chicago Yacht Club gave a series of boat races Sept. 6 and 7. Single sculls, won by C. S. Downs, in 4m. 7½s. course, three-quarters of a mile. Four-oared shells, Darlington and Riverdales fouled, former came in first. Canoe race, one-quarter of a mile and return, won by Heissler. Subsequent races followed. The Shavant Boat Club of Boston, rowed their annual regatta over the South Bay course, Boston, Sept. 5. S. Gookin won in the single-scull professional, and J. B. Reilly in the amateur race.

HEAVY-WEATHER YACHTS.

Roslyn, L. I., Sept. 9, 1878.

EDITOR FOREST AND STREAM:

I have waited patiently for some reader pen to speak a good word for my pet—the centreboard sloop, but I have waited in vain, so will now tell you and your readers of the "Corinthian" brotherhood what I know to be facts. I suppose the writer of your interesting articles on the cutter yachts has practically tested his theory, and knows just what he is talking about; all the same, I am willing to risk the prediction that the cutter will never take the place of that essentially American craft—the centreboard sloop—in American waters.

Often have I watched the cutter at home in her own English choppy seas, as well as the efforts of her faulty imitations here, and do not hesitate to say that in all the points of speed, seaworthiness, beauty, quickness in stays, and lastly, in comfort, she is inferior to a properly constructed and modelled sloop. For fifteen years I have sailed my own boat, assisted by my friends, with never the aid of a professional. During eleven years of that time our sailing has been done in a sloop (Herreshoff's second) 45ft. over all, 16ft. beam; with 8ft. draught—just what your cutter man would call a skimming dish. Ah, but I'd really enjoy seeing him (not his man) go forward on his cutter and reef, turl, or "bob" his jib in an old-fashioned "greyback" off Block Island. If he did try it, he'd best know how to swim—he'd have to dive anyway. Why, one night at Newport, I boarded a well-known iron cutter, and talking to the fore-mast man—he knew—asked how she sailed, and what kind of a sea boat she was. "Oh," replied one, "she's safe enough, but a beast for sailing under water instead of over it;" and it takes seven men to get her club-top sail aloft, and nearly breaks their backs at that.

Well, our cruising ground in the skimming dish has been any where between New York and Nahant, east of Boston; our sailing season all the year round, when Joe permitted. We never turned tail but once to bad weather from necessity. That was off Brenton's Reef in a November sou'-wester, when my crew, all told, was one smart boy of fifteen. So you will see that kid gloves were at a discount about the Qu' Fite. We have sailed in many regattas, almost always pitted against professionals; have won

many prizes; have lain off Cape Cod and Block Island for weeks at a time, long before such a thing as a harbor was known at the latter place, and come the weather how it might, our little sloop never failed to sail.

If I were going to China, and meant to stay there, I should sail in a keel-boat, simply because less skill is required in steering her, and other things being equal, she can be built stronger; but she should have neither the center rig nor model, for both are clumsy, while the latter is better suited for sub-marine work than for riding the seas. To cut the matter short, I will say that a deep keel-boat is entirely unsuited to the ordinary yachting of our waters, for the good reason that her needless depth prevents her entering many of our most pleasant harbors and bays with any degree of safety, while some of them she could not get into at all.

A few years ago, we were one day running through Flsher's Island Sound, when a yacht five times our size, attempted passing us to windward. This we never permitted, so we luffed out, and left her nicely by crossing a reef with about six feet of water over it. She saw the point—but not the rocks—followed us, and of course remained in that spot all day to give her owner time to reflect on the folly of carrying a keel which he could not lift.

I would suggest to those who desire a steady boat in all weathers a compromise between the two extremes of depth and shallowness—say a slightly hollow decked, rocker keel of about 1 ft. in depth, with a centreboard one-half the usual size, a little less beam, and a long slide to sail on.

T. C.

Our correspondent has done the admirers of the centre-board sloop a real service in thus placing before the public his practical experience in a yacht of the usual American type, and if we cannot go to the same length in our enthusiasm over the dish-model, his efforts to establish her reputation as a sea boat are in the right direction. But we submit that his experience has been almost one-sided, for it is hardly enough ground to condemn the cutter on, when he cites the opinion of some hands before the mast. Nor does he touch upon the most important points in favor of the cutter, her absolute safety in all weathers and seas, her small area of canvas and its consequent superior handiness. That a sloop may occasionally ride out a gale is true enough, but when the centre-board has all it can do to hold her own and keep from capsizing, or drifting on a lee shore the heavier cutter would be making easy weather and good time of it. The smaller the craft the more do these remarks apply, for in them the proportionate increase in displacement and weight is greater than in larger yachts. However, it is not at all to be disputed but that the centre-board sloop is good enough, in fact, just the thing for Sound sailing, with an occasional run at sea in fair weather; and since a large share of yachting in America will always continue to be done under these circumstances we never look for, nor do we advocate, the entire extinction of the sloop yacht, but on the contrary consider her a most effective type of vessel for short home cruising. But when it comes to knocking about the coast as a matter of business all through the season, anywhere and in any kind of weather, a more powerful yacht is needed, as experience teaches. To be so, calls for greater displacement or weight. This, in connection with speed, can only be obtained by a deep and narrow body, for a deep and wide craft will make a lighter, very uneasy at sea, and not a yacht. Glance at any craft, especially fitted for sea work, altogether apart from yachts as a class, and note their natural tendency to the cutter form. Our pilot boats are deep keel craft with more ballast than a yacht. Nova Scotia fisherman, who know not what a yacht is, use long deep open boats, and drier, better sea boats cannot be found. The smacks along the Scottish, Norwegian and French coasts are all very deep. These and similar craft are the result of experience and experiment lasting over many years. But we need only to look nearer home. In a six or seven-knot breeze, which has been blowing some time and raised a sea, such yachts as *Vision* and others like her are utterly helpless and could no more beat to windward than fly. For such work we need abler boats and for such work the cutter is eminently fitted. We need not go to the extremes that have lately come into vogue in England owing to the pinching tendencies of the measurement rules of the Y. R. A., but from four to four and a half beams for length will produce fine, powerful and easy seaboats that can cruise on any ground. As for shallow harbors, we have not yet seen the port worth making but what you could carry all the way from 6 to 10 ft., with room to work ship in. That there is a tendency among cruisers to adopt the cutter, and that in seeking a new model they were not satisfied with the sloop, is evident from the number of deep craft among us increasing from year to year and the testimony we are receiving in their favor. In so far as we are concerned our only object is the furtherance of a spirit of genuine seamanship and yachtmanship, things of which most of our amateurs have as yet very slight conception. If the healthy and instructive sport of sailing and not mere jockeying in a race is to be promoted as well in the sloop as in the sea-going cutter we are ready to countenance one type quite as much as another. Our object is the advancement of the spirit of nautical adventure with its concurrent attainments in seamanship and navigation, and our thanks are due to our correspondent for placing the possibilities of their acquisition in the centre-board sloop in a strong light before his more languid brethren who handle the tiller.

THE FOSTER YACHT MODEL.

BOSTON, MASS., Sept. 10, 1878.

EDITOR FOREST AND STREAM:

Having made two trips to East Gloucester to see the new yacht of a curious model, I feel confident as to my ability to give your readers a description of her. At my first visit she was still on the

stocks, and presented a most strange appearance, as she was unlike anything I had ever seen. Homely beyond anything I had ever seen, as she is devoid of the graceful lines and proportions which have always been accepted as the standard of beauty in naval architecture. It is impossible to describe her model without a diagram, as she is so unlike anything I have ever seen as to be beyond description by mere words, as will be seen by the following figures:

Fig. 1 represents her as she appeared to me broadside, when on the stocks; and Fig. 2 a cross-section amidships. There is not a straight line about her, although she is a craft of 23 tons burthen. Her timbers are all crooked, as may be seen by a reference to Fig. 2, making a narrow deck and bottom, and widening out between like the bulge of a barrel.

She has no keel, her timbers coming together below the space being filled with iron as ballast, thus making a solid mass of timber and iron to a depth of something like three feet, in place of the usual keel. This, as may readily be seen, gives her great holding qualities, a point which, with her other peculiarities in her model, makes it evident that she cannot be easily capsized, as her inventor, owner and builder, Mr. John C. Foster, claims that she may be heeled over to her scuppers without displacing more water than if she were upright.

The overhanging stern shown in the diagram, extends back 18 ft. from her stern-post, and as she now lies in the harbor, it cannot be distinguished from other portions of her hull having greater draught. Mr. Foster claims that her carrying capacity is fully double that of any other model of the same tonnage, owing to her bulging sides. She is the result of many years of study and experiment, his object having been to devise a model that would enter and leave the water with the least resistance.

She is 67 ft. over all, 11 ft. beam, with 6 ft. depth of hold. She is schooner rigged, with a jibboom from the foremast to the knight-heads, and if more canvas be desired, a jibboom can be rigged out instead of a bowsprit.

To secure himself he has filed a caveat, and will very soon take out a patent to protect him from infringements. Last spring Mr. Foster completed the model from which his yacht is built, and though only 8 ft. 6 in. long, she sailed 450 feet in 1 m. by actual measurement. This made him very sanguine of success, and now since the yacht is complete, nautical men look forward to her trial with considerable interest; for, although the weather has been such as to preclude anything like a fair test, yachtsmen and builders think she will develop some remarkable sailing qualities.

In talking with those about Gloucester, I found quite a diversity of opinion, as is usual in such cases, one old sailor expressing himself to the effect that he should not like to trust himself far out in a heavy sea, as the water would pound her stern all to pieces. This, indeed, seems to be a general impression among yachtsmen, and in reality seems to be founded on obvious reasons. However, her trial trip will be made in a few days under the direction of several prominent yachtsmen, when her powers will be fully tested.

D. L.

The new yacht which our correspondent has described above is creating a good deal of speculation among our Eastern friends. As far as we are enabled to judge from the accounts of her to hand she embodies certain principles which we have all along strenuously advocated. The particular shape of the lines of this new craft have little to do with the underlying elements of design, for the latter might be embodied in a great variety of form. The Gloucester yacht combines a long easy form with a low centre of gravity and may therefore be accepted as a fine sea boat without further question. As to her overhanging counter whether it will "hammer" in a sea way depends upon the form given it. In this respect she resembles the famous English yawl *Julianar*. By keeping the sternpost well forward and the forefoot rounded off she will be remarkably handy and if too much dead wood has not been sacrificed to obtain this point she should also be weathery in smooth water or in a tumble outside. So far as the "tumble home" of her topsides is concerned we cannot give to this measure our approval. It will serve to keep her easy in a seaway by preserving a low meta-centric height at moderate inclinations, but it is a question whether her designer has not gone a little too far in this respect and sacrificed more statical stability than was necessary in view of her low centre of gravity and easy form, which would of themselves have secured ease of motion among waves. In rig she seems to approach the cutter, for what our correspondent terms a jibboom is nothing else than a running bowsprit. With some of the statements made to him by her builder we cannot coincide, as for example, where Mr. Foster implies that she will not displace more when heeled than when upright. This no yacht does anyway, for if the lee shoulder be greater than the wedge lifted out to windward every yacht will rise bodily until her displacement when heeled will equal it when in the vertical, for the simple reason that displacement is dependent upon weight and not upon form. Nor is Mr. Foster correct in saying that her capacity is larger than that of any other yacht of same tonnage, both being identical in meaning. On the whole we see no reason why the new craft should not be a success in every particular so far as we are able to judge from the information to hand. From this it does not follow that the principles embodied in his novel craft by Mr. Foster cannot equally as well be engrained upon a design which in

general outline will conform more to what we are accustomed to. In principle the Gloucester boat does not differ materially from the British cutter, however much she may do so in mere outline.

CANOEING IN HOME WATERS.

BROOKLYN, N. Y., Sept. 9, 1878.

EDITOR FOREST AND STREAM:

Among your readers are doubtless some brethren of the paddle who have been unable this year to spare the fortnight or more of time requisite for a canoe cruise up the Sound or on the rivers, and to them, as well as to others, a short account of a four days' cruise, which I made last month entirely within the limits of our own bay, may, it strikes me, prove interesting. And if any reader should feel tempted to follow my example, he may rest assured that this fancied familiarity with the shores, though gained by months or years of gazing from a steamer's deck, will, when he is once in his canoe, most entirely and satisfactorily vanish from his mind.

A stiff southwest breeze was driving the white-caps up the bay as the *Rosalind* (Nautilus) poked her sharp nose around the breakwater at Gowanus in the early morning, and as I headed her at the sea, and noticed that a yacht, beating down to the Narrows, had double-reefed her mainsail, and taken the bonnet off her jib, I congratulated myself that masts, sails, and everything that could possibly catch the wind had been snugly stowed below. The spray slapped my face as the waves now and then broke over the bows, but the little boat topped most of them neatly, and after two hours' good, hard work with the paddle, we rounded the point of Staten Island, and glided into the smooth water of the Killarua little wet, but otherwise very comfortable.

Here, however, we met the obb tide running down from Newark Bay like a mill-race, and when at last we reached the float at the Shore House, on Bergen Point, I was decidedly tired and hungry. A series of violent rain squalls detained us here until after two o'clock, when, the rain ceasing, the boat was spunged out and our way resumed.

At Elizabethport the flood tide making its way into Newark Bay from the Sound, was met; but by keeping close in to the winding shore, I was enabled to take advantage of numberless eddies, which materially lessened the labor of paddling; and a few pleasant hours having passed, a dozen ready hands lifted the boat upon the dock at Rossville, and stowed her safely in the porch of the hotel, when I made my very simple toilet, and seated myself to a well-earned supper.

A long night's rest refreshed me immensely, but I was in no hurry to leave the pretty little village, and the day had well begun before the canoe was launched. A leisurely paddle of about an hour brought me abreast of Tottenville, where I ran ashore beneath the bluff, and proceeded to fill my canteen with fresh water, and to overhaul my running rigging. This done, I pushed off, and passing Perth Amboy, the mouth of the Baritan River, and South Amboy, laid a straight course for Keyport. The bay was smooth as a lake, and a slight mist hid the more distant objects from view; but I found plenty of amusement in overhauling the numerous fishing smacks which were drifting down with the tide, and which, being under paddle, I quickly caught and dropped, arriving finally, about half-past eleven, at the sleepy little town, with its wharf and myriad oyster shells baking under the August sun.

Here I disposed of a luncheon of oysters and bottled stout—latterly, by the way, the barbarians ice!—and then paddled out of the cove, exchanging greetings with the oystermen handling their long racks, and the fishermen hauling in their nets. To each of these I put the same question, a simple formula, which, during the past summer, has procured for me a vast deal of information and amusement, and which I can recommend to all would-be cruisers as the *open sesame* to the fisherman's heart. It conveys at once a delicate compliment to his supposed rank, and an appeal to his superior intelligence, and is invariably answered with alacrity and cordiality. It moreover involves no waste of breath upon the part of the canoeist. I said:

"Cap' how far is it to the Highlands?"

For so simple a question it drew answers strikingly varied.

Said Number One: "Twelve miles."

Then followed a digression upon the subject of canoes.

Number Two replied readily: "Fifteen mile or so," and followed with a few remarks concerning floating cottages.

Number Three put the distance at eighteen miles, and discoursed upon the double paddle.

Number Four promised me a paddle of twenty miles, as did Number Five; while Number Six fell back upon eighteen miles, and then fixed his attention upon my nine-foot mainmast, which I obligingly allowed him to watch as I paddled away.

And now for four long hours I struggled against a head tide and rising wind, hugging the shore where practicable, but frequently obliged to make long detours to avoid the lines of nets; and mentally anathematizing the estimable gentleman who first gave to the *Nautilus* canoe that *Frighful* sheer which makes her in a head wind the slowest boat afloat. At length, however, the low trees and sand of the Hook became visible over the port bow, and entering the Horse-shoe, we crept along under the wooded Highlands. Then I felt in my tired arms that the tide setting up the Shrewsbury had reached us, and we presently hurried at racing speed past hills and flats, cottages and restaurants, shot under the bridge, and ran up to the wharf.

After a quiet evening and night's rest at one of the hotels, and a climb up this hill to the lighthouse, from which point the view is superb, I breakfasted; then took the canoe from her hiding-place behind a shed, launched her, and paddled down the stream, amid considerable chaff from the boatmen, who evidently put not their faith in paddles.

The morning was beautiful, still and hazy, and through the clear water I could see the bottom of the river, and the marine plants and long grass reaching nearly to the surface. The work was easy, the boat moving rapidly, and as we slipped past the sandy beach of the Hook, I felt remarkably contented and happy. Near the steamboat dock I fired my formula at a lone fisherman in a small-boat, and learned that I was about two miles from the point of the hook; then I landed to seek a second breakfast (not having tasted food for all of three hours), and was informed that the dis-

tance was six miles, but as this information came from a land-lubber, I took it *cum grano salis*.

Food was found and eaten; then followed more paddling, and at last I ran ashore at the point, around which the tide doubled and ran out to sea with astonishing speed. From the beach I could faintly see through the haze the outlines of the hills at the Narrows, and as these landmarks were enough for my purposes, and a good sailing breeze was now coming in from the southeast, I pushed off, hoisted mainmast, and with sheet well slack off, headed due north, the boat riding easily and comfortably over the long swells coming in from the ocean. A ship in tow, some distant sails, and a few tumbling porpoises, were the only objects of interest besides the channel buoys, which the next half hour showed me; but at length I caught sight of the Coney Island observatory looking, from my lowly seat in the canoe, like a far-off buoy; so, trimming in a little, I steered for it, the steady freshening breeze increasing the boat's speed until it reached a point which was decidedly exhilarating.

Arriving at last off Cable's Hotel, I coasted along past Brighton and Manhattan Beaches to the outer end of the island, where I landed and dined, and then struck and stowed away my mast, preparatory to a passage through the creek, and under the many bridges which span it. The tide laid by this time turned, and was running flood, a fact which filled my breast with joy, for on a previous occasion I had been forced at low water to wade through this self-same creek for about two miles—in water, say three inches; black mud, one foot; clam shells, indefinite quantity, and my feet tangled at the remembrance; but now I passed quickly through the inlet into Sheephead Bay, then doubled and wisted and turned through the windings of that creek, ran under bridge after bridge, and presently the low, white house that was my goal peeped out from among the willows, and I landed.

No Brooklyn boating man, who hungry, has entered and lingered in Van Sledra's low-ceiled dining room, or, tired, has stretched himself on the sleep-provoking beds of that time-honored inn, will wonder that it was high noon next day before the *Roseland* was taken from the stable where she had passed the night, and lunched.

A gentle southerly breeze filled her mullin as she glided out of the creek into Gravesend Bay, homeward bound, and before it we ran past Fort Hamilton, then across to Staten Island; back again, and finally up along the Bay Ridge shore to Gowanus Bay and the boathouse, ending thus pleasantly our short but satisfactory cruise.

W. M. C.

We have taken the liberty of italicizing a portion of the letter, as fraught with interest to canoeists in selecting a canoe for special work.

Sea and River Fishing.

FISH IN SEASON IN SEPTEMBER.

FRESH WATER.	SALT WATER.
Trout, <i>Salmo fontinalis</i> .	Sea Bass, <i>Silurus aotolanus</i> .
Salmon, <i>Salmo salar</i> .	Sheepshead, <i>Achoerichthys probatocephalus</i> .
Salmon Trout, <i>Salmo confinis</i> .	Striped Bass, <i>Morone saxatilis</i> .
Laini, locked salmon, <i>Salmo gairdneri</i> .	White Perch, <i>Morone americana</i> .
Grayling, <i>Thymallus</i> .	Weakfish, <i>Cynoscion regalis</i> .
Black Bass, <i>Micropterus salmoides</i> .	Blackfish, <i>Pomatomus saltatrix</i> .
A. nigricans.	Spauld Macrel, <i>Cyprinus maculatus</i> .
Minnow, <i>Leucis nubilus</i> .	Cero, <i>Cyprinus regalis</i> .
Pike or Pickerel, <i>Esox lucius</i> .	Bonito, <i>Sarda pilchardus</i> .
Yellow Perch, <i>Perca flavescens</i> .	Kingfish, <i>Menticirrhus nebulosus</i> .

FISH IN MARKET—RETAIL PRICES.—Bass, 20 cents; smelts, 25; bluefish, 10; salmon, 30; mackerel, 25; weak fish, 12½; Spanish mackerel, 50; green turtle, 12; terrapin, per doz., \$12; halibut, 15; haddock, 6; king fish, 25; codfish, 10; black fish, 15; flounders, 10; porgies, 10; sea bass, 18; eels, 18; lobsters, 10; sheepshead, 25; frogs, 35; scallops per gallon, \$1.50; white fish, 15; pompano, 75; hard crabs, per 100, \$2.50; soft crabs, per dozen, 85.

In quoting prices of fish, it must be remembered that they are retail prices and have nothing to do with wholesale prices.

A very fine pompano was caught on Monday at Rockaway Inlet. As we wrote in our last issue, this fish is by no means uncommon in our waters. Very possibly, if fishermen had proper nets, pompano could be captured in quantity along the Long Island and New Jersey coast.

ONTARIO—Kingston, Sept. 9.—Fishing this season has been exceedingly good. Surrounding us on all sides are hundreds of small lakes which team with black bass, Oswego bass, pike, pickerel, salmon and numerous smaller fry. Yours truly made a number of excursions on the different lakes, and always succeeded in acquiring himself creditably. Owing, no doubt, to the numerous rain and thunder storms, the fishing has not been so good of late, but as soon as the weather settles the lovers of the rod will find plenty of sport. A. I.

MASSACHUSETTS—Nantucket, Sept. 10.—The fishing season is just, and in a week or two most of the boat will be laid up. A large shark was captured by Mr. Barnes from the shore at the south side of the island. A number of skipjacks have been caught in nets at Great Point the past week.

JACK CURLEW.

New Bedford, September 14.—The past week a few pompano have been taken in the trap at the mouth of Slocum's River; also a bright-sided diamond-shaped fish, with long filaments extending from the dorsal and pectoral fins. Wind east, and few striped bass and bluefish caught.

CONCHA.

MOVEMENTS OF THE FISHING FLEET.—The fishing arrivals for the week include some good fares of codfish from Grand Banks, the total receipts being 760,000 lbs. Bank halibut have been in moderate receipt, the number of arrivals being 9, bringing 275,000 lbs. The number of Georgian arrivals has been smaller than usual, 25 vessels, bringing 850,000 lbs. codfish and but little halibut. The Baymen continue to arrive, bringing good fares, but the reports are not considered favorable for a good fall catch. The number of arrivals for the week has been 9; receipts from the fleet, 2,685 lbs. mackerel; by freighter, 650 lbs. The Shore fleet are doing nothing. Arrivals this week, 3; catch about 300 lbs. Whole number of fishing arrivals for the week, 49.—*Cape Ann Advertiser*, Sept. 18.

New York—Shelter Island, Sept. 12.—The bunker fishing in the waters of Peconic and Gardiner's bays and along the Long Island coast, outside, has been remarkably profitable this season. The fish have been brought in to the factories in millions, and of very good quality, averaging three pounds to the thousand. For the last week the waters have been alive with them, and more of them taken than could be used up by the factories. The surplus supplies are being sold to the farmers at the rate of seventy-five cents per thousand.

ISAAC McLELLAN.

Lake Port, Sept. 10.—Five hundred to six hundred pounds black bass taken here in Oneida Lake during the last week, the largest weighing about five pounds.

N. BASS FISHING AT NIAGARA FALLS.—The black bass fishing on Niagara River above the Falls has been better this year than ever. These waters are the natural home of the black bass, and it is one of the best, if not the best, black bass grounds in existence. About the same number of large fish as usual have been taken, but a far greater number of small and medium ones. "A great many small fish were taken with a fly from the shore in July. The season with us extends from July 1 to October 1, the best fishing being in August and forepart of September, when they are taken at the foot of bars in deep water, in eddies, etc. An unusual number of visitors have availed themselves of the beautiful scenery and splendid fishing on the river above the Falls this season, and it is for the information of those who are ignorant of one of the finest places around Niagara, and for those who would like to spend a few hours taking the noble black bass during their stay at this famous watering place, that I write these few lines. A new steam yacht has been placed on the river for the accommodation of fishing and pleasure parties. Small boats and boatmen in abundance and at reasonable rates. The fishing points are but a short distance from the town, and any one who sees fit to investigate the claims of this least known, but one of the best fishing resorts in the country will be amply repaid. By addressing P. Walker, boatman, boats, bait, guides, and all information may be obtained.

R. S. C.

NEW JERSEY—Barnegat Inlet, Kinsey's Ashley House, Sept. 13.—Easterly storms past week. No fishing of any account except sea bass, of which Col. Post has been taking 20 to 75 each water. Master Willie Kinsey found a large specimen of sea turtle on the beach near the Old Manor of Health. It measured fifteen feet long, nine feet wide, and estimated by competent judges to weigh from 1,500 to 2,000 lbs. Its throat was cut. Before parties provided with axes, knives, etc., for the purpose of securing the shell, could get back, the tide washed the monster away. I have since learned that five others, smaller in size, have washed ashore at different points on the beach.

B.

Barnegat House, Forked River, Sept. 17.—Owing to the recent storms on the coast, the fish have not been biting so well the past week. Two of our yachts, *Zane*, Capt. Frodmore, and the *Vapor*, with Capt. Jos. Holmes and Mr. Hopkins, of New York, came in to-day with a fine lot of sea bass. Very few sheepshead have been taken on the old ground, where a net was hauled some time ago in the night by parties from Waretown. It was then reported that some 600 fish were taken in one haul. The oysters are finer than usual this season, but not very plenty.

AKRURIN.

PENNSYLVANIA—Pike County.—Bass fishing in the Delaware has been unusually good and many fine ones have been caught between Egypt Mills and Bushkill. Mr. R. J. Henderson leads the "summer boarders," however, having caught the heaviest fish. Its weight was 4½ pounds, length 18.6 inches.

Greenville, Sept. 7.—Professor Roth still continues to haul out occasionally a nice pike. He intends visiting Slippery Rock, Butler County, soon, where black bass and pike are abundant.

B.

BETTER TIMES COMING.—*Lindon, Pa., Aug. 30.*—Western Pennsylvania stands second to none for good trout fishing. Some five or six years ago a man that had ambition enough to clamber over rocks and logs and brush, and every other sort of rubbish, in his nature has seen fit to adorn the trout streams with that flow between fishermen and mountaineers of McKean County, Pa., could fill his glass in very short time with trout weighing 4½ to 1½ lb. But, alas, what a change! Sportsmen from every part of Western Pennsylvania and York State flocked in here (I think I may safely say) by hundreds every season, until in course of time there were more anglers than trout, and for the past two seasons we catch here in very small, so small indeed that the return from the mountains to try the fishing was with grief, disappointment and hunger stamped on every feature, is no very common sight. I met one of those unfortunate mortals some time ago, and on being asked "What luck?" he replied, in a very faint whisper, "Oh, pretty good—I had what I wanted to eat," and almost in the same breath inquired if I could tell him where he could get some dinner immediately. But there are better times coming. The Ludlow Trout Company have been able, through the good management of their superintendent, to re-stock some of the neighboring streams above Ludlow, Pa. Last year they planted 100,000 brook trout fry at their own expense, and we have every reason to believe that within a reasonable time—say two years—our sporting friends with the rod and fly will say: "Better times have come."

SPECTATOR.

INDIAN TERRITORY—Fort Sill, Sept. 9.—The bass fishing has developed this year in the streams upon which this fort is situated. Capt. Anderson, who used to correspond with you, thought in '73 and '74 that if he caught a dozen bass during the season a half pound weight he was doing well. It has not been uncommon to draw out dozens daily of two and a half to three pounds weight this season. Y. W. D.

For Forest and Stream and Rod and Gun.

ANGLING IN THE SOUTH.

DO not, brother of the rod, think that I am to give you miraculous stories of immense trout, "monarchs of the flood," which I have inveigled from their native element. The elegant equipment, the long, pliable rod, the burnished reel, the casting line, are here, all out of place. In their stead we have a long, light cane (the longer and lighter the better), a light silk line and a small salmon trout hook. Thus equipped, we go forth, like all you gentlemen anglers of the North, to varying fortune. I will venture to say that there is

not a single stream in the South in which the reel can be used to any advantage. Imagine a deep, dark, gently dawning stream, whose banks are covered with a dense growth of vines, trees and weeds, whose bottoms are filled with logs, brush and stumps. Here and there open places can be found in which you can fish all day without fouling your line, but these places are not such good fishing as the "haughty" ground. Thus you have the picture of nine out of ten Southern streams. What would a genuine disciple of old Izak do in such waters? Assuredly, he would lose his fish, his line, and clog his rod.

Our main reliance must be, then, upon skill in keeping our fish from the logs and brush after we have hooked them. And they always hunt for them; hunt for them with a persistence and vigor that puts a speckled trout to shame. We have three fish in the South upon which we depend for our angling. The bream, the red perch and the speckled perch. Of course, *M. salmoides* jack fish, raw mouth perch, and, in some streams, true perch, help to while away the rainy hours. The true perch are only found in Little Pede, Great Pede, and a few other Southern streams. They are called "red fin trout" in most localities. They attain to a large size, for I have caught them weighing fully four pounds.

First, as to the red perch. This very splendid game fish is found in the North in the New River, in Onslow county, North Carolina. It is found there in the south. In all the streams that empty into the Atlantic. Strange to say, it is not found in any southern streams that empty into the Gulf of Mexico except in the Chattahoochee, the Flint and their tributaries, weighing, under favorable circumstances, as much as two pounds. Muscular, active and intrepid, he gives one all the fight there can be in a fish of his size. Cautious as a deer in the water, he is, except the bream, the most difficult of all fish to capture.

During the spawning season he loses much of that caution which is his safety at other seasons, and will bite ravenously at any kind of worm, even if it be accompanied by a line large enough and strong enough to catch a twenty-pound blue cat. The gravid fish, called yellow perch, are not near so large as the males, yet they too afford fine sport. They are found in the North in the New River, in Onslow county, North Carolina. I am sure you will find them, by the way, in his "Fish and Fishing," states that the sunfish are large weights over half a pound. I have caught them weighing over three times that much. In all the Western lakes they grow even larger. The red perch thrives, contrary to the general opinion, in mill ponds. The finest that I ever caught in a mill pond was taken in a large mill pond in Lumpkin Co., Georgia. Their favorite feeding ground was near a large swamp, and that had fallen into the pond. The pond was very clear, but by using a rod twenty feet long, a very fine silk line, and no sinker, you could capture in a day's fishing, say twenty-five of the scarlet gentlemen; and a fine string it was, for none of them weighed under a pound and a half, and some over that weight. Of course, it was lazy fishing compared to wading for trout, and I enjoyed it more than I ever did fly-fishing, in this may sound heretical, but it is true.

Our next fish for consideration is the bream. The habitat of this noble fish on the Atlantic side is from the Neuse River, in North Carolina, to the St. John's River, in Florida. He is found in all the streams emptying into the Gulf of Mexico, and as far North and West as the Green River in Kentucky, and in some tributaries of the Mississippi on the North. Having a very geographical distribution, he necessarily differs, as do all fish, in size, markings and color. The bream, for example, of the Ohio River lakes are no more like the bream of South Carolina than a sunfish is like a perch. But he is a bream, nevertheless. Those of the lakes mentioned rarely exceed in weight three-quarters of a pound; they are dark, short and thick. But it is of the bream of the Carolinas and of Georgia that I now propose to write. Bream so large, so game, and so toothsome, were not known in Carolina, in one of his letters written home during the Revolutionary War, said that South Carolina was worth conquering for her bream alone.

Red perch are very shy and wary; but there is no comparison between them and the bream, for the bream is to fresh water fish what the sheepshead is to salt water fish. There is no fish so capacious and such a delicate feeder. The bait that you employ is a worm, a minnow, or a tadpole, and is not rejected. They feed on worms of every kind, but chiefly upon the caterpillar of the catalpa tree, generally called "catalpa" in the South.

It is October. No frosts have as yet fallen in our latitude, but many delicate trees have shed their leaves, and the intolerable glare of the sun at midday is softened by a great, heavy haze that hangs over all, seeming to touch the very earth. The sun, and the geographical position, and the broad, flat, like sky, like grim skeletons forever at their paces, and the mass of vines and creepers, once so green, now look like piles of flame heaped against the dark waters. All is solemn and still save the angry bark of the gray squirrel or the sullen splash of some predatory jack as he chases the minnows for his morning meal. This is the season for bream, the time when you catch them. You know how, to your heart's content, go with me on this beautiful day in your Southern stream. Do you see that green bush which bends over the water, and whose boughs are kept in constant motion by the gentle current. Now drop your line very gently above the bush, stick your rod in the bank and sit down, and keep down. And here, Mr. Roosevelt, I will propound a fish conundrum for your special benefit. Why is it that suckers, bream, perch, and minnows, when they are in the water, do not bite as well when you hold the rod in your hand as when you stick it in the bank? With all due humility I would suggest one reason: the magnetic influence of the body extending down the rod and line. You may laugh, but there must be some truth in it.

But to our bream. At first you see a tremulous motion of the line, then a tug, then a rush far down the stream, then a convulsive leap in the air, if you have hooked him, and you commence a battle with a "bald bream." No! No! No! Angling this, but angling which requires all that you know of the gentle art; for your tackle is so very fine and light, the fish so heavy and active, that to capture the largest bream, with your surroundings of logs and brush, is equal, *ceteris paribus*, to the capture of a ten-pound salmon. If any one doubts this, let him reflect that in fishing for salmon you have to use a heavy rod, a large reel, and a large line, perhaps two hundred yards in length, a good reel and a No. 10 hook. In fishing for bream I use a single strand of black silk, a No. 6 salmon trout hook, and a red delicate enough for fly-fishing. My word for it, if any enthusiastic salmon fisherman were to use the tackle I have named above, the very first "bald bream" that he hooked would bring the blood to his face in a rushing tide, and he would feel that old familiar thrill run

down his arm, which ever comes to a twenty-pound insect, as it is. Bread is gone to the very last, often, indeed, seeming to reserve their final artistic plunges to the time when you think you have them safe. Often have I had to mourn the loss of a monster beam that seemed to have all the fight taken out of him. Delusive thought! Deluded angler! That beam had only sat around to rest himself! With energies fully restored, with an Arnold Winklered determination to make a last fight for liberty, he would snap my fly line, and being his head a final twinkle in the air, would disappear from my sight forever.

The term "bald beam" may, perhaps, need some explanation to Northern readers. The male beam has, when full grown, a burnished, copper-colored head. Standing in front of the fish, there is a fanciful, funny resemblance to a bald head. Hence the term. If any Northern angler doubts that the beam is a game fish, and that I have drawn upon my imagination, let him come down to Georgia and try them himself. He will be convinced.

The speckled perch next demands our attention as a true game fish—more especially, as in the estimation of some people, no fish can be considered game that does not feed on flies or minnows. How about suckers, which feed on neither? Yet, I venture to say that no fish can pull harder or make more desperate efforts to free himself from the hook.

While, in the White River, Arkansas, it is no very uncommon thing to catch them eighteen inches long and weighing from three to five pounds. They are bold biters, and afford, with a very light tackle, fine sport. If you fish for them with a cord as large as a broom straw, a cork as big as your fist, and three or four large buckshot, a pole as long and as heavy as the lance of a Cossack trooper, they do not pull much, being engaged in drawing the load you have imposed on them. They will bite and chide on minnows, but they bite in the fall of the year very freely at red worms.

There is a curious circumstance connected with this fish. They were never seen in the waters of North Kentucky until about the time that Alexander Campbell organized his church, the communicants of which church were called "New Lights." Hence the fish were called "New Lights," which name, I presume, they retain to the present day. And yet, as I know what I have written, a feeling of sadness comes over me as I think that I shall never more, perhaps, hear the sweet whirr of the red as a ten-pounder dashes madly down the stream. I fight for my style of fishing now, but deep down in my soul, I suspect, there lingers a regret for old times and a traitorous longing for the red and reel.

Fraternally yours, ST. CLAIR.
Lafayette, Ky., August, 1878.

THE "CITY OF WORCESTER."

MINNEAPOLIS, Sept. 9, 1878.

EDITOR FOREST AND STREAM:

The "City of Worcester" left Worcester Sept. 2, at 7:30 P. M., with a party of twelve sportsmen and sportsmen, the former in large majority. If they are not all familiar with the shot-gun they have shown themselves experts with the hook and line, of which you will hear more as we proceed.

There has been the centre of attraction and visited by many ladies and gentlemen. The general expression was of approval and surprise at the conveniences found in so small a space, and I feel could avail themselves of this "novel" mode of traveling, as they express it, the regular trains would have but few occupants.

Arrived at St. Paul a little behind time, on the morning of the sixth, on account of the State Agricultural Fair, the visit of the President and bench show for dogs, all going on at the same time. By the courtesy of Mr. W. H. Fisher, Sup't. St. Paul and Pacific railway, our car was run out to the fair grounds, about four miles, giving the party opportunity to see all the attractions. The President's train who left last evening for Bemis, we visited the dog show on the grounds. Later we were taken by the regular evening train to Weymouth station on the St. Paul and Pacific R. R. near Lake Minnetonka for a day's fishing on Saturday. By the courtesy of Mr. W. H. Shney, of Minneapolis, all the arrangements for a day's fishing on the lake were made in advance. Mr. S. and his friend Wm. Corlies, of St. Paul, joining our party, making fourteen in all and just filling our beds.

Friday evening we had a very early breakfast and an early start for the fishing grounds on account of the early start of the worms brought by the early fish—wasn't that rather discouraging on the early start—but as you know all well-laid plans of mice and men do fail, sometimes, so old our early start came to naught on account of a very rainy rain which commenced some time in the night and did not cease until about 8 o'clock P. M. Soon as it was settled that a fair day was coming five small dories were very quickly filled with ladies and gentlemen, two lines to a boat, all eager for the first fish. Just before starting it was proposed to make up a purse of 25 cents subscription, the amount to be paid to the one taking the first fish, but failed because the proposer could not raise the said quarter, which of course led the rest of the party to "smell a mouse." Let strangers might suspect innocent persons, I would say it was neither of the original party, nor the St. Paul members; that's as far as I care to go.

Being a fish story is must be confined to fish for the present. The little arrangement, so afterwards learned, was a black bass anchored out in the lake, and not far out, just where a certain boat was expected to pass; but as the purse was not made it fell to Mr. John Babcock to fish the first fish. He succeeded in catching nearly three pounds. Then followed in quick succession black bass and pickerel to every boat, about equally divided between the ladies and gentlemen. At noon we found ourselves in flames Bay, six miles away, with our appetites getting beyond control. We soon had a fire all ablaze and the fry pan full of black bass and pickerel, nothing less than two pounds allowed in the pan. The number of two and three pounders disposed of at that dinner can never be told and if it could would find few believers. As I propose to write of nothing but facts I leave the rest of the dinner to future correspondents to tell the incredible tales to every boat, about thirty good fish attended all the boats. At the landing we counted up 104 fish, weighing 250 pounds, none over twelve nor under one pound each.

The largest were not hauled into the boat but drawn up, so they were known to weigh from fifteen to twenty pounds and then lost; very unfortunate to lose so large fish, but could not be helped. All agreed that a pleasure-trip could not have been made on that lake, or any other pond ten feet ready and our party ready to do justice, and if you had looked in again you would have seen what we had done for a week. It's only 10 P. M. our car was taken by a train and landed at Minneapolis, where we found the train waiting for the Presidential party. Attorney-General Devens visited our car, but there being no politicians present no speech was made.

AFTER MISKALONGUE.—Mr. S. A. Kilbourne, the artist, who has been making sketches of fish for the forthcoming work to be published by the Messrs. Scribner, to be called the "Game Fish of America," has gone to Canada in order to make a study of a muskallongue. At Mr. Blackford's in Fulton Market Mr. Kilbourne has his atelier, and on the easel and the walls of Mr. Blackford's private room may be seen many truthful sketches of fish. We are pleased to state that the work of preparation for this important book is progressing rapidly, and that one of our leading ichthyologists is preparing the text.

BRECKON-LOADING GUNS AT AUCTION.—The firm of Barker & Co., New York, have made themselves popular with the sporting fraternity by their auction sales of sporting guns. They opened the present season by a very successful sale on Tuesday and Wednesday of this week, and announce the second sale of the season on the 27th and 28th inst. We are acquainted with the above firm and believe that any statement made by them can be relied upon. The next sale will comprise a special consignment of new guns from nearly all of the celebrated makers of the world. The sale will be conducted by the good-natured and obliging young auctioneer, Mr. George J. Banks. [See Advt.]

—Attention is called to the advertisement in another column of the New England Life Insurance Company, which is in every way reliable and trustworthy.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

A. M. V. Nyzek, N. Y.—Deer hunting is prohibited in Pennsylvania this year.

J. W. B. Boston.—We can send you a copy of Caton's "The Antelope and Deer." Costs \$3.75.

SCHUYLKILL, Phila.—Want to make a bass fly-rod. Instruct me. Ans. See last number F. & S.

J. W. Philadelphia.—The address desired is Dr. C. J. Kenworthy, Jacksonville, Fla. Tell him what you want.

SUBSCRIBER, Stamford, Conn.—The gun is first-class. You will find good shooting in October about Waterbury, Conn.

R. W. A., Allen Station.—Your dog has probably a rupture. A surgeon ought to determine this upon examination.

A. M. Burlington.—The mangle will not thus be transmitted. You should describe the form of mangle which the dog has.

A. F., Fort Riley, Kan.—You can procure goose callers from any of the sporting goods dealers who advertise in our column.

Dr. L.—We have written so much about choke-bore that we cannot give it again in detail. See former numbers of the paper.

H. G. P., Providence, R. I.—The ryle you mention is just coming into use. Think it would do very well for hunting purposes. We never compare one ryle with another.

ENGLISH SPARROW.—The contributor to the English Sparrow question in issue of Sept. 5, was Dr. R. Sterling, of Cleveland, O., instead of the name erroneously printed for the same.

J. V. Warren.—Are white squirrels a rarity? A friend of mine caught one a few days ago. He has it in a cage. It is about the size of our common gray and black ones. Ans. Quite rare. It is an albino.

H. S. F., Marlboro, Mass.—We cannot understand the case as stated, and so we are unable to give any opinion. The fact that the about in question is the final one of the season should not alter the rules followed in other cases.

M., Boston.—What is the scientific name of the loon, or North American diver? Ans. *Columbus torquatus*, the great northern diver; *Columbus arcticus*, the black-throated diver; *Columbus septentrionalis*, the red-throated diver.

J. H. B., Washington, D. C.—Can any physical harm come from allowing a clean, unaltered dog to sleep with you? I have a beautiful little black and tan fond of nestling by me in bed. Frequently let it stay by me all night. Ans. No harm if dog is clean and healthy.

H. W.—Have a Whitney rifle 30 inch barrel, 41 cal. How light a bullet can I use with 70 grs. of powder for successful hunting and perhaps larger practice up to 200 yards? I use 350 gr. bullet for target, is it right weight for 70 grs. powder? Ans. You have the right weight of powder and ball.

TERRELL, New York.—A small terrier one year old has fits, with foaming at the mouth. Drops down exhausted. What is to be done? Ans. There is no specific cure. Do not overfeed the dog; give plenty of exercise and occasionally a little sulphur. Time generally brings about a cure.

ROTOR CROIX, Halifax.—For photographs of *Sappho* and other yachts address Holmes, photographer, 235 Broadway, N. Y., and mention our name. Price of large sized photos 50 cents apiece. For very correct paintings of yachts in oil address Butterworth, artist, care Thos. Hooper, 114 Nassau st., N. Y.

G. H. P., Portsmouth, Mich.—Possibly the worst way in the world to load a rifle is exactly what you do—to put a ball in the palm of the hand and pour powder over it. The load then depends entirely on chance. Use a small measure, and once having secured that you will no longer waste powder on your hand, or on any man.

R. W. B., Pittsburgh.—How can an man in a long-range match at 870, 900 and 1,000 yards make a score of 270, as claimed by the Sharps Rifle Co. in their advertising columns? Ans. That 270 is the score made in military match, by a team of four men, shooting military guns, seven shots per man at each range—800, 900 and 1,000.

WISCONSIN, New York.—See note under game table. The New Jersey law prohibiting shooting by non-residents without a license we think constitutional. The West Jersey Game Society has jurisdiction over certain counties in the eastern part of the State to hunt in which you must have a certificate from them. Their headquarters are at Camden.

W. B. Rochester.—Express bullets are smooth, not grooved. They are patched with paper in some of the English cartridges, but not always; a lubricating wax is used. Dittmar powder has not yet been used, at least publicly, in Creedmoor rifles. We understand that the Winchester Repeating Arms Co. are loading some cartridges with Dittmar.

F. W. S., Buffalo, N. Y.—You will find excellent shooting in Cass, Crawford, Gasconade, Lewis and Pettis counties, Mo., and also in many other parts of the State. Good courses are Harrisonville, on the Mo., Kan. and Tex. R. R.; Arlington, on the At. and Pacific R. R.; and La Grange, on the St. L., Peoria and Northwestern R. R. You will find plenty of sport for rod and gun there this fall.

A. P. G., Cleveland.—In mixing Dittmar use equal bulks of both. See last page for more thorough method of loading Dittmar. Mixing wax and oil together, for rubbing bows, the proportion of oil to wax is small. Beeswax and sperm oil, fourteen parts of the first to a part of the oil; or simply put a drop or so of oil on a woolen rag and rub wax on the bow and rub and polish down the wool.

E. G., Brooklyn.—Could not advise you as to best rifle for a powder is excellent for general use. You cannot load a rifle with the machine you mention. Do not know the standing of the party, excellent shooting on the Mississippi south of New Orleans. The rifle you mention is excellent for all purposes. Wingate's manual and Perry's Score Book. The best costs \$1.25, the second \$1.00.

S. D. W., Jefferson.—My setter dog, 4½ years old, has h. or four months a coughing cough. He pants after the least exertion. Appetite irregular. Will I pass my hand over his chest he seems in pain. Hal dry and hard; no snot. Ans. The dog probably has bronchitis, or pneumonia. Keep him warm and dry, feed him on beef tea, and probably at this stage of the disease 2 grs. of quinine three times a day will be of service.

J. W. J., Opelousas.—1. What is the address of Arnold guns? 2. Which are the best sizes of Ladin & Rand's Orange Ducking powder, and of their Orange Rifle powder, for breech-loading shot-guns? 3. Is the cross between the red Irish and Gordon setters considered a good one? Ans. 1. Hillsdale, Mich. 2. In L. & R. Ducking, No. 6; in Orange Rifle powder, Fg. 3. Does no harm, but is not advisable. Keep such breed to itself.

J. C. D., Portland.—My pointer, six months old, was bitten on the ankle of one of his hind feet some months ago. Was lame, but has improved. Last Sunday he was exercised, when on coming home his hind legs began to tremble. I worked him after that, but he got worse. Now he is completely paralyzed. What is to be done? Ans. The dog has probably received some spinal injury. It is impossible to prescribe for him satisfactorily without seeing him. As he is so young rest and quiet may restore him.

E. C., Brooklyn.—1. Is a — as good as a — for general use? 2. Can you use Remington's cartridge loader (Webb's patent) for loading 1 rifle cartridges, or is it only named for loading shot shells? 3. Is the firm of — reliable? 4. Is — good for general sporting use? 5. Which is best, to make your own bullets for the No. 45 (30 grs.) central-rifle cartridge, or to buy them? What is the price for a bullet mould of that size? 6. What kind of powder is the best for loading rifle cartridges? 7. Is there any good hunting around the Mississippi River below N. O.? Ans. 1. One as good as the other. 2. No. The Webb's patent is for shot-guns. 3. Don't know anything about it. 4. Yes. 5. Buy your bullets. Mould would cost \$3. 6. Fg. 7. Yes, you will find excellent sport there.

W. D. T., Chicago.—Dixon Kemp's "Manual of Yacht and Boat Building" will cost about \$10 in this country, as there is a heavy duty upon books. Can send you a copy as soon as shipment from England is received. The book contains a full and complete set of instructions, telling of the difference in the conditions under which yachting is pursued in America and England, you would have to do at some what for differing circumstances. For boat building procure Nelson's "Practical Boat Building," price \$1.25. Can obtain it as soon as second shipment comes to hand, the first having been exhausted. See also back files of FOREST AND STREAM. In a future issue we will give directions for laying out courses; no book containing directions for same.

C. E. C., Albany.—I have a setter puppy six months old. Generally playful and hearty, but on four occasions, when exercising him, he has had fits. He stops, staggers and falls. Eyes roll and look like starting from their sockets. Fits sometimes followed by a short illness. Eyes sometimes vacant and staring. Will the puppy outgrow these attacks? Recommend a course of treatment. Ans. He has what physicians call "fits per excellence." The disease affects young dogs only, and is often difficult to account for, though often due to the presence of worms in the intestinal canal, in which case special remedies for their removal are indicated. An occasional course of sulphur, with a few doses of castor oil, will often do good, and times generally effects a permanent cure. Avoid over-feeding. The immediate cause of the fits is disturbance in the circulation of the brain.

D. S. L.—Please help a stuck sportsman out of a regular fix. I wish to put a new extractor in the bolt of a Henry rifle (old pattern), but I myself unable to take out the bolt. I know it must be in two pieces and supposed, as there was a small hole through the casting, that there was a rivet to punch out, but I have tried with a steel punch all along the case which the bolt goes through and am unable to find one. If I knew there was one, and just what part of the case it was, I could drill it out; but I am not sure that is the way it comes apart, and I can find no one who knows, and the nearest gunsmith 100 miles away! Ans. There is a pin which holds the extractor in place. Take out the hammer and draw breach pin-basis clear back. The rivet as you call it will then come in line with hole in frame and can be punched out. See page 80 of Winchester Repeating Arms Co. catalogue; this will give you a good idea of the mechanism.

S. C., Worcester.—1. Does the National Rifle Association allow entries to be made under assumed names in competitions for prizes? 2. If a person in any competition shoots his rifle and the cartridge proves to have half a charge of powder, if said person calls another's rifle allowed him?—3. The case in point is on a shot report in your last issue under "Shrewsbury" where E. Weston leads the score by 180. Some of us claim and entered protest that his score should be only 125. At 400 yards Mr. Weston fired a shot which was signaled 0. On returning to his place he claimed another shot on account of leaving half a charge in his cartridge box. We all knew the shot was poor so soon as the discharge took place, but another shot was allowed him and he made a bull's eye which was scored him. Ans. 1. Not now. 2. No. 3. All wrong. If the ball left the gun it was a shot. Sir H. Harford fired without a bullet in the Centennial match and was scored for a miss.

H. Concord.—An average of 2½ pellets of No. 9 shot, in a 30 in. circle, at 75 yds, a good pattern for a 75 lb. breech-loader, 12 gauge, vs. in. barrell, W. & C. Scott & Son's modified choke? Which is the strongest action—a single bolt and extension rifle, or a double bolt with the extension rifle? Is there anything to prevent the bore of a gun stock from rising on becoming wet? I have a nice gun with a very smooth and hard stock that got wet the other day, and is now quite rough. Do you know of any good dog breaker within 50 miles of here? Is there any good horse shooting in the middle of October, what birds principally, and where is the best place within 30 or 40 miles of Boston? What is the best preventive against rust from the salt atmosphere? What is the best charge for a 7½ lb., 12 gauge, 28 in. breech-loader? What is the best oil for a gun? Ans. 1. A very good target. 2. Never will be decided. 3. It can be done by means of warm iron, and then gluing down the raised fibres. When wool has this tendency give it a good rubbing with uncoloured linseed oil. 4. No. 5. Go down to Cape Cod and the adjacent coasts. 6. Use the Hutton's Treat. Preventive. 7. Use only the best sperm oil for the working parts of the gun.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 3537.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements must be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

*Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, SEPTEMBER 19, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURRILL, Chicago, Western Manager.

THE YELLOW FEVER FUND.—More money has been received to be added to "The Sportsmen's Contribution" to the fever sufferers of the Southern cities. Aid from all parts of the country has been most generously extended through the different agencies. We have to-day given to Mayor Ely \$39, making a total of \$336.

The detail of subscriptions were:

Franklin Ride Club, Hartford.....	Unity Club, Brooklyn.....	\$3
Conant.....	M. P. McKoon, Franklin, N. Y. 5	\$25
H. D. Bydenburgh.....	Farrow Bros.....	1
Total.....		\$39
Before acknowledged.....		\$317

A NOBLE DEATH.—It is our sad duty to record the death of the Rev. Louis S. Schuyler, assistant clergyman of the Episcopal Church of Hoboken. This gallant young man, who was but twenty-six years of age, impelled by a sense of duty, left for Memphis on the 6th of this month, arriving there on the 8th. The Orphanage in Memphis having been ravaged by the fever, all the sisters of Mercy but one having been stricken down, Mr. Schuyler bravely walked into the jaws of death. In nursing the sick children the young clergyman caught the fever on Friday last, and, as a true Christian hero, on the 17th of September, passed away to another and better world.

NATURALISTS' CLUBS.—We are glad to note from time to time the formation of naturalists' clubs and societies for the study of natural science. Especially are we gratified to see young people, the boys and girls, turning their attention to the investigation of physical phenomena. Nature, in her manifestations of design and adaptation to the thousands of forms of means and ends, offers an abundant field for investigation and richly-rewarded research. We may not all have the honor of giving our Latinized name to a bird or a bug, but every student of natural history may enjoy in some degree the satisfaction which always follows personal investigation and discovery.

THE CREEDMOOR FALL MEETING.

AS we go to press the ringing of the rifles at Creedmoor tell of the lively fall meeting in progress there. In our next issue the story of the several contests will be told in full and at present we can only bring the story up to time call of the first match. The Committee have made all preparations for a successful meeting, and with weather to match there is every prospect that good scores and a successful time will result. At short and long range matches of various sort may be entered into and the military marksmen cannot complain that they have been overlooked in the make up of the matches.

Looking at it from a sensational or popular standpoint the meeting is a quiet one. There are no foreign teams to dazzle the eyes of those who know next to nothing of the matter of rifle shooting. There will be no Dudley Selph coming heralded with the richest of rifle records. Yet Creedmoor will be crowded. There will be plenty of shooting and good shooting too, done by men who have learned to love their rifles by visits to the ranges. Of teams there are a plenty. The militia of the State are coming out in very good force, while from other States year after year shows a growing inclination to display their prowess on the great Creedmoor range by visiting military shooters. From Boston to the East and Washington in the South the teams have come to enter in this or the other match. The result of the contest between the regulars and the militia will be looked to with interest. Whoever may win, this is the opening match of a series which should be kept up and extended in generous rivalry until the two branches of the defensive service shall polish each other into bright ability with the rifle. Next week in addition to a careful critique of each day and its work the match records will be summarized into convenient form for future reference by our readers.

A LESSON TO BE TAUGHT.

THE inculcation of this lesson lies at the root of all things. It checks waste, loss, and riot. It tends to curb lawlessness, and teaches children the first ideas of self-restraint. It kills and curbs the natural avarice in us. No doubt but that man instinctively was a murderous, greedy creature. Like the dog which worries the sheep, he may have been inclined just to kill wantonly right and left, simply for the killing sake. This is an old instinct which unfortunately remains, though held in abeyance by education. With this preamble, every word of it true, though we may have repeated it a thousand times, we will still endeavor to teach the idea of restraint.

The season for game is just opening. Many of our young readers may be going into the field for the first time. If in certain localities game be plenty, attempt no battles. Such everlasting slaughters belong to a past age. The ethics of the sportsman ought to be ever on the advance. If with your gun or your rod you have killed birds or caught fish in fair sufficiency, stop. Why will you wantonly destroy God's creatures when you really have no use for them? We would a hundred times rather cite in our columns that ten brace of quail or grouse had fallen to the share of a good sportsman in a day's honest walk, than that he had killed a hundred birds. With an over-quantity of the game killed, there always comes across our mind something disparaging as to the quality of the man who shoots the gun. We love to copy in our pages something of this character (our readers will find it in "Schmand's" correspondence), how, having killed his elk, it was wanted for food; he sees more elk, and lets it pass unscathed. Such a man is an honest sportsman, and has the right kind of a heart. We hold it, then, to be wicked, even villainous, to go into the field, like the destroying angel, bent on letting no living thing escape. This is the text, then, to instruct your children: the lesson of self-restraint. Give a boy a gun, and if there be plenty of game say to him, "Kill honestly, in sportsmanlike style, just so many birds and no more. I would rather you came home with an empty game-bag than with more than you could carry. Never waste life uselessly. Self-restraint in your pleasures or amusements is quite as useful as when directed toward the graver occupations of life." Such, then, is our sermon, and we pray it may be heeded.

[FROM A STAFF CORRESPONDENT.]
ROCKY MOUNTAIN WANDERINGS.
No. 4.

WHEN I last wrote you some few days ago, we had just reached our camping ground among the Freeze Out Mountains, and so favorably did all indications appear for game that the whole party were eager to investigate at once the country in which we had stopped. Behind us the mountains rose almost vertically to a height of some 2,000 feet, and at intervals of about half a mile were seamed by deep gorges in which the quaking aspen brush grows in the greatest profusion. On the rocky slopes of these ravines the mule deer, so universally misnamed black-tail, delights to feed, and among the dead timber, further from their mouths, the grizzly bear, always avoided by old hunters, should have his lair. On the undulating table-lands, reached after the mountains had been climbed, we shall be likely to find the stately elk; and the high peaks of granite or the volcanic dikes, which at intervals intersect the beds of older rocks, will perhaps be frequented by that great object of each western hunter's ambition—the big horn, or Rocky Mountain sheep. Naturally, then, we are

anxious to explore localities of such promise, and the evening of our arrival, there being still two hours of daylight after we had finished supper, we made a reconnaissance of the mountain. The almost vertical slope of the ascent was rather appalling to one who is so little accustomed to mountain climbing on foot as myself, but, by selecting a game trail which zigzags to and fro on the hillside, I thought the climb might be made without too much exertion. Mr. Phillips and I then took this trail, while Mr. Reed ascended by a route which, although more precipitous, was somewhat shorter. Hardly had Mr. P. and I reached the trail when we stopped in great excitement to examine it. The path was worn down nearly a foot into the dirt of the hillside, and was perfectly covered with elk and deer signs, most of it not more than a day old. It looked as if hundreds of heads of game were in the habit of traversing the path each day. So we advanced cautiously up the mountain side, almost forgetting, in our anxiety and excitement, to feel tired or out of breath. The ascent fairly accomplished, we proceeded slowly over the rolling upland, and as we entered the dead timber by which most of the plateau was covered, came suddenly on a fine buck antelope which was feeding among the trees. He bounded off without any notice from us; we were after larger game. The mountain upon which we were separated by a deep but narrow canyon from the one which Mr. Reed had climbed, and before we had proceeded very far on our way we heard half a dozen shots in quick succession, showing that our companion had found game. We were following fresh elk tracks through the thick, dead timber, when something moving off to the left caught my eye, and before I could distinguish what it was, Mr. Phillips dropped to the earth, and seemed to try to make himself as small as possible. I imitated his example at once, and from my prone position made out the forms of a number of stately elk moving with slow and majestic steps through the forest. They were all bulls, and some of them had magnificent horns. Evidently they had not seen us, but the shooting on the other side of the canyon had made them uneasy, and they were slowly traveling away from the noise. Their horns, although full grown and nearly hard, still bore the velvet, and it was interesting to see how slowly and carefully they moved among the trees, turning their heads with the greatest care to avoid striking their horns against the branches. As they passed along we counted eight of them, all with fine horns, the two leading animals especially bearing heads that would be hard to equal. A moment more and they have disappeared behind some high rocks, and we are hard after them. A few moments later we round a point of rocks, and see the herd standing among the timber about two hundred yards off, while the leading bull has mounted a little knoll, and stands with eyes, ears and nose intent to catch any sign of danger. He is almost concealed by the trees, but there is a little space, about twelve inches wide, through which I can see his shoulders. Phillips whispers, "Now, Professor," and with the greatest care I shoot for the shoulders. The bull does not move. I have missed him, and, bewildered by the echo, he does not know whence the report comes. Another shot is followed by a mighty crash, and the splendid animal, with pierced lungs and broken shoulders is struggling among the fallen trees. The remainder of the band flee at once, without giving an opportunity for a shot at them by Mr. Phillips, and we advance to our game. What a superb creature! How he compels our respects, even now when his life is so nearly spent. The blood flows from his nostrils in a thick stream, showing that he has been shot through the lungs, and only an occasional movement tells us that he still lives. We administer the fatal coup, and the brave stag ceases to breathe.

When the work of butchering the quarry is over, the sun is near the western horizon, and we hasten to our camp, pausing at the point where we commence to descend to admire the wondrously beautiful scene spread out on all sides. The peaks of the mountains are gilded everywhere by the declining sun, while the brown valley below lies in the shadow. Yet this is not without its bits of light, for it is dotted here and there with little lakes, which still seem to gleam and sparkle, although the sun's rays no longer strike them. At different points, high up on the hill-sides, the light still falls upon the deep red strata of the Triassic beds, which alternately flash and pale like the glowing coals in a furnace; then, as the bright rays cease to reach them, fade and grow cold again. Throughout the plain, which lies at our feet, the courses of a dozen streams may be traced by the winding lines of dark-green foliage, aspen and willow, nourished and kept fresh by the cool waters which pour down from the granite hills. But the surpassing feature of the whole picture, so extended and widely varied, was the sky. Over the western hills the sun, in all his splendour, was slowly disappearing, while above and around him, yet in no way dimming his brightness, were banks of clouds, gorgeous beyond description, and reaching, though with gradually decreasing brilliancy, almost to the zenith. Here the clear sky was still of the palest blue, while toward the east the color dimmed till it became a dusky purple, and above the summit of the eastern hills hung a single point of silver light—the evening star.

As the last gleam faded from the mountain top, we turned and silently took our way down the slope. While still only half way from the summit, we heard a sharply-echoing shot, and then another, and, looking toward the foot-hills, we saw a splendid buck springing down one side of a canyon, and then up on the other, while several hundred yards distant stood Reed, gazing regretfully after the escaping animal. Proudly the buck dashed on, making for the trail by which

rifle-makers do not turn out such an arm. We want a rifle .45 or .50 cal., that can be thrown to the shoulder without adjusting sights, and throw its ball level up to 200 yards. We have sportsmen who can drop a buck with such a gun as much certainly as a snipe at 35 yards with their choke-bore. I have made hollow balls and tried them in different rifles, but there is not a shell made that will hold enough powder to drive them straight up to 100 yards. They lose penetration rapidly after 200 yards, but 200 yards is a long way to kill a deer. I have heard men talk of killing deer at 100 yards with a shotgun. My experience is, if I get a shot at deer at 50 yards, I am lucky to get it after running it with hounds 10 miles. My gun is full choke, and at 60 yards I can put two or three buck into my old hat every time. It takes a big shock and a bigger charge of good powder to stop deer in their tracks. Such is my experience for the last six years in Texas. San Antonio, Texas, Sept. B. R. B.

COMMON SENSE CHAIR.—There is made by F. A. Sinclair, Motville, N. Y., the Common Sense Chair. Among the numerous improved sources of comfort offered almost every day to public desirous of sitting restfully, particularly during warm weather, this chair is by no means the least. Without any pretensions to the luxurious cushions of the usual lounging chair, it affords a degree of comfort and rest which cannot be added in the former. We do not propose to explain this minutely, but cordially suggest that you try the Common Sense Chair, and secure the utter rest we enjoy in its ample and so conveniently disposed proportions. In it there is no rest for one part of the body to the discomfort of any other. Happily, all there is of you is induced to rest thoroughly. For the man of business, who seeks relief from the burdensome application to correspondence at the usual style of desk, the reading and writing table adjustable to this rest will greatly facilitate his work, as the body may be at all times in restful position, and books and papers approach one's person at any convenient angle. The chair, with table, is a veritable benediction, while "the chair, my pipe and I" are the very picture of felicitous rest.

Game Bag and Gun.

GAME IN SEASON FOR SEPTEMBER.

Moose, *Alces maculata*. Black-bellied plover, ox-eye, *Squatarola helvetica*. Ring plover, *Agallitis semipalmata*. Elk or wapiti, *Cervus canadensis*. Stilt, or long-slanks, *Himantopus nigricollis*. Woodcock, *Philohela minor*. Red-breasted snipe, or dowitcher, *Macrorhamphus griseus*. Ruffed grouse or partridge, *Bonasa umbellus*. Wild turkey, *Meleagris gallopavo*. Red-backed sandpiper, or ox-bird, *Tringa americana*. Quail or partridge, *Ortyx virginiana*. Pheasant, grouse or prairie chicken, *Cupidonia cygus*. Ruffed grouse or pheasant, *Bonasa umbellus*. Quail or partridge, *Ortyx virginiana*. Yellow-throat, *Tolanius semipalmatus*. Tattler, *Tolanius melanoleucus*. Yellow-shank, *Tolanius flavipes*.

"Bay birds" generally, including various species of plover, snipe, and phalarope, and also, *Actitis macularia*, *Actitis hypoleucos*, *Actitis macularia*, *Actitis hypoleucos*, *Actitis macularia*, *Actitis hypoleucos*, etc., coming under the group *Limicola* or Shore Birds.

This table does not apply to all the States. It is meant to represent the game which is generally in season at this time. State regulations may prohibit the killing of some species of game here mentioned.

GAME IN MARKET—RETAIL PRICES, POULTRY AND GAME.—Philadelphia fowls, 17 to 20 cents; do, chickens, 18 to 25; do, ducks, 18 to 20; do, geese, 17 to 18; do, turkeys, 17 to 20. State and Western fowls, 14 to 17 cents; do, chickens, 15 to 18; do, ducks, 15 to 18; do, geese, 12 to 15; do, turkeys, 15 to 18. Poultry, \$1.50 per pair; grouse, \$1.25; red birds, 75 cents per doz.; squabs, \$2.00; rail, \$1.25; woodcock, \$1.25 per pair; large snipe, \$3 per doz.; small do, 75 cents.

ONTARIO—Kingston, Sept. 9.—I see by the weekly reports from all parts of the Union that the prospects of plenty of game, and consequently good sport this season, is more than the average. Unusually fair prospects also await the lovers of the rod and gun in this fair province of ours. I notice an almost entire absence of sporting news from this side of the lines, only an occasional communication finding its way in sports columns, notwithstanding the large number of ardent sportsmen who would make most excellent correspondents. We have a tolerably good game protection law, and game of all kinds, in consequence, is plenty, especially are the prospects good for the approaching season. From all parts back of the city reports daily arrive that deer, duck, partridge, woodcock and plover are very plenty.

THE CONNECTICUT LAKES.—The rod and gun have abundant use in the region of the Connecticut Lakes. That wilderness has been delightfully free from the regular round of tourists who have not yet discovered the good things in the dense forests there. The recent notice which we have taken of the locality will doubtless send scores of people there, so all are hereby warned, as in the city entertainments, to "come before the crowd."

Ten thousand acres of land there, in the northern part of New Hampshire and including a part of the First and all of the Second and Third Connecticut Lakes, are owned by two gentlemen of this city. In response to our inquiries they reply:

We have not the slightest objection to any lawful fishing or hunting on the land, or of the proper use of wood for camping purposes. Net fishing, fishing or hunting out of season—or the peeling back for camps (as has been done in former times) we do object to, and will prosecute offenders where we can get information. We have made application to the N. H. State Fish Commission to get land-locked salmon to put in the lakes. Messrs. Norton and Chester at Second Lake act as guides. Mr. Chester has a good cabin, but tents are necessary generally.

MASSACHUSETTS—Framingham, September 18.—The game season opens rather dull hereabouts. Woodcock are reported scarce; ducks don't seem to arrive much as yet. There are some snipe on the overgrown meadows, but hard to get at, and harder still to get near. They fly high and wide. Ruffed grouse have, I think, hatched well, but they won't suffer much till the leaves fall. No reports yet on quail, but few wild pigeons. F. C. B.

Nantucket, Sept. 10.—There have been heretofore very large flights of plover the past week. Every one was out, and some gunners bagged sixty each. JACK CRABEW.

MONOMONAC CLUB.—The Monomonee Sporting Club, of the south village of Gardner, Mass., returned home from their annual excursion Sept. 11, having enjoyed their trip notwithstanding the unfavorable weather. A large number of fine pickered were caught, the largest, which weighed two and one-half pounds, being drawn in by Mr. C. F. Reed, of the South Village. The captivo was photographed and prepared for the market, without delay. This innocent amusement of the club were indulged in very extensively, and a very interesting illustration of the wonders of the prairie, made up an evening's entertainment. Mr. G. R. Pratt, assisted by Mr. J. Walker, presided over the culinary department to the entire satisfaction of all, their tables being graced with substantial viands, including ducks, partridges, wild turkey, prairie chickens, squirrels and other game, which were brought in by the hunters. A large number of visitors were received, including friends from Gardner, Winchendon, Rindge, Fitchburg, Boston, Greenfield and New York city.

LONG ISLAND—Shelter Island, Sept. 12.—The sea fowl are just beginning to collect in the bays, and very soon the coot will be here in myriads, furnishing capital sport for the gunner, either by sailing on the water or killing them in battues. The loons—always the first to come—are beginning to pass over bay and beach, and the black ducks are numerous. I tried for them a few evenings since, but got no shot, killing only a long-winged crane. In Montauk the birds have been, so far, very scarce; nor are they plenty on Gardiner's Island. A party of four tried for them there last week, but got only seventeen birds. A few years since the green plover and blackbreasts were there in innumerable flocks.

ISAAC MCLILLAN.

NEW YORK.—Lakeport, Sept. 10.—Yellow legged plover are quite plenty on the shores of the lake. Large bags of woodcock and partridge are made about the woods and cornfields every few days, with quite a number of wild pigeon.

A HUNTING PARTY.—Nyack, N. Y., Sept. 18.—Editor Forest and Stream: A friend and myself would like to join a party of four or five gentlemen to spend about two or three weeks, late in October and November, shooting quail and partridge and deer, if possible. We would prefer to go not more than 36 or 48 hours' ride from the city.

A. M. VOORHIS.

PENNSYLVANIA—Greenville, September 13.—Squirrel shooting has commenced in earnest. Messrs. Brooks, Beatty and Grim shot 59 in one day. Pheasant shooting will be good in this locality, owing to the strict observation of the law, although there are a few pot-hunters who of course don't observe it.

Pike County Notes.—The indications here are that the pheasant will be plentiful the coming season than any time during the past ten years. Already "the woods are full of them." Mr. Harry Nyce, of Egypt Mills, a few days ago shot a gray eagle measuring six feet eight inches from tip to tip.

Middlebury, Pa., Sept. 12.—Some of our sportsmen have been on the warpath for coons and glory. S. S. Schoch, M. Z. Staininger and J. M. Vanzandt recently captured eight of the beasts alive.

COON.

BLOOMING GROVE PARK ASSOCIATION.—On September 28 the executive committee announce that a meeting of the Ladies' Archery Club will take place, when the cup Prize Pot and other prizes will be shot for. Shooting deer is interdicted in the State of Pennsylvania until 1881, the exceptions being on the grounds of the B. G. P. Ruffed grouse and ducks, with rabbit shooting may be had. At present the law and picket fishing is quite good. Apply for permits to Dr. Bradley, Hoffman House. These permits to visit the park embrace all the privileges to intending members, after the usual introduction, which can be had of the executive committee. Time from Jersey City four hours by rail, and one hour and fifteen minutes by stage. Excursion tickets all around, \$5, to be obtained at the E. R. R. office, Broadway and Twenty-third street.

KENTUCKY—Stanford, September 13.—Reports come in from every direction that the season has been unusually favorable for nesting, and that the crop of quail is larger than ever before known. The birds are generally well grown, and shooting will begin at light the day after close season. Pigeons, in small numbers, put in an appearance this week. Recent rains and the material fall of temperature will inaugurate fall fishing.

KENTUCKIAN.

TENNESSEE—Savannah, September 9.—The prospect for good shooting has probably never been better than at present. Quail are numerous and unusually forward; many are already fully grown. This is in decided contrast to the state of things last season, when, even so late as November 1, I found several coveys too small to shoot. Squirrels are now "cutting" hickory nuts, and are quite plenty. A party in the river bottom lands, several miles above this place, brought in one day last week, as the proceeds of one day's hunt, eighty squirrels.

WILL.

A FLORIDA CAMPING GROUND.—Editor Forest and Stream: On the east side of the lower road from Homosassa to Bay Point, about ten miles from each place, there is a valley about a mile wide by four long, and a large number of small water ponds. Around one of them are natural raperies covering acres. Bushels of the most delicious grapes I ever tasted were rotting on the bushes and ground. There is not a dwelling within six miles. Wild turkey, bear and deer were plenty, and large flocks of parakeets were feeding on these luxuries. It seemed too bad to see game and fruit so abundant and no sportsmen near. Some four years ago two men with their families located here, fenced in and improved some ten acres and built a good house and out buildings; but the deer and turkey ate up their garden, and the bears and panthers killed and devoured all their hogs and cattle. As there were no neighbors near they grew tired of such loneliness and abandoned their property and moved to Texas. I visited this place last winter, and I should think it one of the best places in all Florida for a party to stay to hunt, say for a month or so. It lies between the great Gulf Swamp and the Natikla Hammock, a kind of crossing place for game. W. Putnam, Conn., September, 1878.

TEXAS—Houston, Sept. 4.—I consider it sufficiently worthy of remark to make note of the unusually early appearance of migratory gargo birds in this latitude. Mr. Wyse,

who lives about six miles from Houston, at what is known as Pierce's Junction, on the San Antonio R. R., reports having seen and killed several jackrabbits (of the *Lepus arizonae*) on the 10th day of August, and that Tom Robinson also reports having seen several birds a few days subsequent to this date. This, I am confident, is an unusually early arrival of this species of snipe in our latitude. On referring to my own record of early birds, my notes give the 19th day of September, 1878, as a very early date, and it was so considered by the majority of sportsmen with whom I spoke in regard to it. The next night, the same Mr. Wyse mentioned above wrote me, that there were several individuals, who, unable to take the long journey to their northern breeding grounds, had remained with us during the summer; but a careful and thorough examination failed to discover any marks of former wounds. Many seem to think that their early arrival here is indicative of a long and severe winter. Several flocks of wild geese going South at this time, and the predictions of weather prophets, seem to lend some color to this opinion. I myself can imagine no cause for their appearance here at this time. We can attribute it to unusually cold weather in their northern summer residence, and of this I have seen no account. Our summer has been uncommonly wet, raining almost continuously, with short intervals, for the past two months. September sets in cold and cloudy, with the wind from the North, accompanied with rain. Should it continue this way for any length of time snipe will be abundant with us in a few days. J. W. D.

"CITY OF WORCESTER."—Editor Forest and Stream: Arrived at this place yesterday afternoon, going out of the direct line to visit the Centre, where we had been expected to find them in any quantity. On the same train we met Mr. Hallock, John Davidson, I. W. Whitman and others, all bound for the Field Trial, which is to come off about fourteen miles south-west of Sauk Centre. Deer are said to be very plenty all about here for miles in any direction one may go. Coming from Sauk Centre our party saw three deer near the track, Duck and geese are abundant in every plenty. Leave a Brierfield, N. Y., for the city of London, where we expect to find the sharp-tail grouse and ducks and geese.

Brainerd, Minn., September 12.

DAKOTA.

DOVE SHOOTING EXTRAORDINARY.—Mariboro, N. J., Sept. 7.—Mr. Taylor, of Colts River, N. J., has been repairing immediately to this place, as the prospect for some fine sport was very encouraging that afternoon. I soon dove the distance of five miles, and was upon the grounds promptly and in good season—half-past twelve o'clock p. m. There were, however, ahead of me several other sportsmen, and their shooting-stands were already all arranged with proper blinds, admirably located, and I was told several hundred birds were off the trees when the first party approached. The birds were feeding upon lately sown rye, not sufficiently covered with soil to quickly germinate. Only a few had returned by one o'clock, and as yet not more than two or three killed. I consulted with my friends as to the best remaining position for me to occupy. The field commanded a fine view of the surrounding country, and gave one an excellent opportunity to see the approaching game in all directions. Now this was the first of doves that I had ever seen in a field in an adjoining corn-field. The corn was very tall in places and small in others in this field, containing about forty acres. The doves were also feeding upon rye in this field. You could get in good range of them in the tall corn, but frequently could not see them long enough to get a good shot. Where the corn was small they could see you approach, and it was almost impossible to get in range. After waiting some time in the field while, and killing a few, I returned to the others, and found their numbers so largely augmented, and every available position taken, I concluded to stick to the corn-field. At this time there were fifteen shooters upon these fields, and one or two had discovered my retreat. I had all the company it was safe for me to have. About two o'clock the birds began to fly thick and fast. Sometimes in flocks of twenty and thirty, but often in single file. The flight of doves is very rapid, and five o'clock it was one constant fusillade. It was not far from the village, and I am sure the inhabitants must have been alarmed. The falling shot frequently fell all around you, and in a corn-field, where you could not see distinctly more than forty yards, it was not the most comfortable place to be in. So much firing at the birds in and out of range caused them to fly very wild and high, and of course no one made an extraordinary shot. The birds, however, are somewhat different, and requires no small degree of skill and practice to kill them successfully. After the flight was over, and the extraordinary sport at an end, we all got together to talk the affair over, and count out. As near as I can remember, I will give you the individual scores, viz.: Hoyer, 14; Conover, 14; Wm. Buck, 10; John Buck, 8; Campbell, 6; Taylor, 6; Emmons, 8; McLain, 4; Drummond, 4; Reeves, 4; Snyder, 9; Vandever, 3; Magee, 6; others I cannot recall.

WHERE SQUIRRELS ARE A NUISANCE.—Mr. Editor: A recent number of FOREST AND STREAM told us where jack rabbits are a nuisance, and the manner of destroying them. In the southern part of California there exists in countless numbers gray ground squirrels which very closely resembles in size, color and general appearance the gray squirrel of the Eastern States. Their habits, however, are somewhat different. So far as I have seen, they never make their nests or homes in trees, but always take up their quarters in a hole which they burrow in the earth, or else a crack in a rock, which latter device saves them the labor of making themselves a home. They have little or no fear of man. You may approach them to within a few feet before they will run away. They are never eaten here except by the "Grassers," though I suspect they would be considered good food if they were less abundant. They are a great pest to the farmers, being exceedingly destructive of all sorts of grain. Until lately the farmers have waged an unceasing but unavailing war upon them. Shotguns, traps, poison, dogs and what-not have proved ineffectual to diminish their numbers to any perceptible degree. Recently, however, some genius has invented a poison, in which they soak grain, which, however, so deadly that many ranches have been quite rid of these pests. The happy inventor has pocketed a nice sum of money, and receives the hearty thanks of ranchmen generally. An organized and systematic effort at destruction by the use of this poison is about to be put into execution in Santa Barbara Co. M. Santa Barbara, Cal.

WIK A NEWSPAPER MAN WANTED TO BE KILLED.—One of the editors of the staff on a New York daily paper is rusticating in the wilds of Pike County, Penn. In his strolls through the forest he carries his gun along, ostensibly to shoot

squirrels, although we have no authentic information that he ever shot a squirrel or anything else. Being a New Yorker, he ought to know a "yaller dog" when he sees it; but evidently everything is transformed and changed when seen by him in the unaccustomed light of the forests. The dog adventure is confidentially told to a friend in this office, as follows:

This morning before daylight I went out after gray squirrels. After a little while I found myself in a magnificent piece of overhauling woods, with a narrow wagon track stretching away ahead for one hundred yards. Game was the very last thing in my mind, for I was revolving over the contents of a bag of bird shot, and was in the city. When I was casually glancing up along the wagon track I noticed a yellow dog about fifty yards distant, trotting leisurely along toward me. I paid no attention to him, and in a moment was oblivious again. When I raised my eyes a second time the yellow dog was within twenty-five or thirty yards of me. I raised my gun quickly, but the beast had seen me this time, and a bushy tail disappeared in the underbrush like a flash of lightning. That yellow dog was the biggest kind of a red fox, and when I realized the fact that I let him go, I went home and begged the farmer's sons to tie me to the barn door and kick me.

MESSRS. WILLIAM READ & SONS.—This is the name of one of the oldest firms engaged in the gun business in the United States. Through many long years Messrs. Read & Sons have kept up the reputation of their house by the reliability of their goods. Fine arms being above all things something, where the word of a dealer has to be taken as a guarantee, Messrs. Read & Sons have been enabled by their honest dealings to secure the confidence of their numerous patrons. A specialty of theirs is the sale of the well-known guns made by W. and G. Scott & Sons. These breech-loaders have a wide and reputation for strong shooting powers, fine finish, light fitting in the action and locking parts, and for their perfection of proportion. Captain Bogardus had a Scott & Son gun in constant use, and in performing his feat of breaking 5,000 balls his Scott & Son gun had been previously shot over 80,000 times. This same gun has been up to date, shot 65,000 times, being precisely the same gun which Captain Bogardus beat Pennell, Shelly and Coventry, this year in England. With the fullest list of these guns, all sizes and grades can be had, 4, 8, 10, 12, 14, 16 and 20's. Every gun is warranted. In addition to high-priced guns Messrs. Read & Sons have a new grade of \$50 gun, with top-snap action, allowing the sportsman to own an arm of real worth, which costs but little. Knowing as we do the worth of this house and the high position they occupy, we have given our endorsement to their claims on the attention of the sporting public. See their very full advertisement in this week's paper, where all particulars are given.

DR. CARVER ON THE PRAIRIES.—Just before the State Fair at St. Paul and Minneapolis about the first September, our excellent friend, S. B. Dilley, Esq., of Lake City, who recently made our editor-in-chief his guest, took Dr. W. F. Carver, the celebrated rifle shot, out on the prairie near town and let him shoot over his famous dogs Ranger, Royal, Fan, and Queen. They hunted over three townships, and brought him some fine game, but he was not satisfied with the results. They have been curious to learn whether Dr. Carver is a good field sportsman will be pleased to learn that he killed 83 chickens straight, never missing a point.

WILD RICE.—Attention is called to the advertisement of Wild Rice. This much sought for article may now be procured in limited supply. Remember that the early bird catches the worm. Mr. Richard Valentine, of Janesville, Wis., also has a supply of Wild Rice seed.

DOES CHILLED SHOT AFFECT GROKE BORES?—Mr. Ira A. Paine assures us that a few days ago he had his Parker Bro's breech-loader tested to see what effect chilled shot might have had on his piece. During the last two years Mr. Paine has used this same gun at all exhibitions, having fired it certainly over 25,000 times. On examining the barrels, which proved to be full choke, Mr. Paine, of Lewiston, Maine, having critically examined the barrels, they were perfectly intact. This speaks well for both the gun and the chilled shot. As numerous questions have been put to Mr. Paine and to ourselves on this question, we should think that this matter of chilled shot not affecting barrels would be now forever settled.

RUST.—We are glad to know that sportsmen everywhere, East, West and South, are appreciating the merits of "Eaton's Rust Preventer." Like all the other productions of our friend Jacobstahl, it proves the experience of a thoroughly practical sportsman. We congratulate him on his success with that, as well as his recent election as President of the N. J. State Sportsmen's Association. A good man in the right place.

MOVEMENTS OF SPORTSMEN.—Jerome Marble, Esq., of Worcester, has just started for the Northern Pacific R. R., for the shooting season. He will go by the St. Paul and Pacific R. R. to Sauk Falls.

LIGHT CHARGES.—Editor *Forest and Stream*: I agree with "E. R." in regard to his charges for field shooting, for snipe, quail, woodcock, etc., my charge would be only 3 drachms powder and 1 oz. shot. I have shot alongside of gentlemen who used from 44 to 6 drachms powder and 1½ oz. shot at these birds; but I could see no use in such large charges, considering as it does the curving of the one that will throw more weight of ammunition, besides tiring birds to shreds if shot near by, and, if in making a snap shot one's gun gets on his arm instead of his shoulder, and he is not heavily clothed, he feels "in his bones" he has too big a load. But for pigeon shooting I should by all means use a 10-gauge gun and 1½ oz. shot. The light gun—small charges used by "E. R." in this paper—could—savored better shooting done by him, as his charge probably covered a smaller circle than that of any of the others. My article referred principally to the use of heavy guns for wild fowl shooting in late October and November, when canvas-backs and red-heads are wild, strong and heavily feathered, requiring a hard knock to bring them down. And when 1½ oz. shot, No. 2 or 3, seems a small charge when thrown at a swift flyer 50 or 60 yards away, then one must use the best charge of powder, the one that will throw his charge of shot the closest, most regular and strongest. And I contend that 4 oz. 2 gr. is the best charge. "Fusi" hits my "theory," as he calls it, a dig when he advises me to put 6, or even 6½, drachms of powder in my gun and shoot it, and see if I don't feel that it burns inside of the barrels. I confess that for some time I could see no good reason why 6 drachms of powder should exert so much more force against

my shoulder and not increase the force of shot against a target; yet this is the case. I have shot 6 drachms of powder and could not make penetration than with 4, but could get some 400 or 600 per cent. (I had no accurate method of comparison) more recoil. My "theory" is that the extra amount of powder, the amount that I think will not burn inside of the barrel, acts as so much sand might, causing friction, packing, and retarding the force of the shot and increasing the force the other way. Of course a portion of this extra powder will burn outside of the barrels, and until it gets outside must cause recoil. "Fusi" takes the trouble to carefully watch, and has the opportunity of doing it, two men shooting about dusk, one using 5½ or 6 drachms powder and the other 4, I think he will be convinced that the one using 6 drachms is burning much more powder outside of his gun than the other, and in all probability, being equally good shots, is not doing as good execution. If "Fusi" will load half a dozen shells with 4 drachms of powder and 1½ oz. of No. 2 or 3 shot, and another half-dozen shells with 6 drachms powder and same shot, and get at least 40 yards away from a standard pattern and penetration tester and keep an accurate memorandum of the results of each shot fired, he will find his 4 drachm charges give much better pattern, as great, if not greater, penetration, the targets will be more alike, will be more regular in every way than with the 6 drachms, and his gun will be less inclined to be much lessened. At least this has been my experience, and I have wasted much ammunition and have seen others do the same before I came to this decision. I hold to my former assertion, that 4 drachms No. 2 grain powder will give better satisfaction than any larger charge of any grain in a 10-gauge 32-bbl. gun of 10 pounds or less. The recoil is slight and will hurt no one, and the shot will come from a good gun will kill a duck 100 yards away if it hits him in the head or neck or under the wing, or will break a wing if it hits it with 4 drachms of powder. A person who has not tried this will be astonished at the force of a No. 2 or 3 shot at long distances.

Minut Point Shooting Club, Sept. 14. CANVAS BACK.

For Forest and Stream and Rod and Gun. SEPTEMBER SHOOTING.

TO the sportsman resident of New York State, the 1st of September is seemingly the real opening of the shooting season. True, during the preceding month, the season has been open for woodcock; but few birds have been found, and those bagged scarcely equal in number an October good day's sport. Infinitely preferable would it be—for reasons which are obvious—if the close time for *Philohela minor* was extended until the 1st of September, thus saving hundreds of young ruffed grouse that are annually slaughtered under the pretext of August woodcocking.

What becomes of the woodcock during August has never been definitely ascertained. As much mystery now shrouds their disappearance in moulting time as twenty years ago, when "Forester," in his "Field Sports," arrived at either of two conclusions—viz., that of a brief northward migration, or an exodus to the tops of the highest adjacent mountains, there to stay until disturbed by the frosty nights of glorious October. The few woodcock found in August are generally discovered in dry swamps adjacent to some spring drain. If, in September, with its cool breezes, proclaims the coming of autumn, the sportsman is enabled to find his brace or two of ruffed grouse, knocking over perhaps a couple or so of woodcock during the day, then indeed, and not till then, can the shooting season be said to have opened.

The difficulty of killing ruffed grouse has been much overrated, together with the so-called inaccessibility of his haunts. Admitting that he is often found in the thickest brake or the most swampy, impenetrable woods, the interlacing boughs of pine trees and the sinuous rhododendron, he is often flushed in the comparative open of the swampy woodland—the open patches bordering the woods, where grow the raspberry and whortleberry bushes, and, later in the season, upon the edges of the buckwheat fields; while again amid rhododendrons and second growth white birches, he lies well to the setter or pointer, generally being the first shot to the gun. There is a peculiarity about this magnificent creature, in that he ends in his destruction—namely, that the oftener one is flushed the longer and closer will he lie to the dog, and the shorter will be each succeeding flight. At first approach he may flush wild, giving one but the glimpse of his glossy back, and leaving his loud hurrying ringing in the ears. The second flight, should he not lie well, will probably allow a much better glimpse of his plumage; and, if this second time, if the bird be not bagged, you may not regret his wildness, but the hypothesis of an inexplicable something "which no fellow can understand."

As the grouse invariably flies in a straight line, but a slight glimpse will enable one to perceive the direction taken, then making a short sweep to the right or left he alights. Occasionally a bird will rise, and if it be in a tall pine or fir, and especially in a thickly wooded section, it may be one thing to do; if you perceive him as you may, nesting with regal splendor in the shadowy embraces of the pine, then shoot him sitting, if you would have him at all, for a whirr when he flushes is all that will solace you—you will see naught.

Let us suppose a cool, breezy morn in early September, and following a little babbling stream, the drain of some clear mountain spring as it meanders down the hill side, over and between the mossy stones, spreading over the damp ground and watering the luxuriant growth of ferns and mosses, whilst the cool September breeze is sighing among the tall pines, wafting their aroma over the hill side. In a place where the shadows play with the golden sunbeams which come stealing through overhanging foliage which as yet but by a rare and beautifully colored leaf of red or gold betokens that glorious autumn has begun, and our sportsman, as he approaches, pointing—now carefully and stealthily he advances, now becoming rigid under the entrancing ecstasy of the hot scent. Then we advance a step, whilst the ready forefinger is hovering twist guard and trigger; and as the heart in its quickened talior forces the blood surging through the veins, the brain harbors no thought save of the present glorious moment. Whirlwind gusts of gun chain loosened, as the ground begins to quiver, the open air. As we raise the gun we see, as looping yonder clump of rhododendrons, the pointed pinions, fan-like the and the extended ruff whose jetty blackness gleams in the sunlight, the typical emblem of American feathered game. But a report has broken the stillness of the hill side, and "Dead bird, fetch," proclaims that the shot has been true.

Nearing the base of the hill, we overlook a blue limpid pond

nestling among huge boulders, in whose shadowy recesses luxuriant fern growths are blooming, vieing in their picturesque fantastic outline, the virgin beauty of the lilies along the shore. Here in an adjacent clump of alders the dog is pointing, but not with that sneaking, crouching attitude he employed when working on the grouse, but firm, upright, rigid, with head but slightly lowered and turned, and advancing we are not surprised to hear the tremulous whistle of the woodcock as we see but a glimpse of his shadowy form darting through the interlacing covert, but even that glimpse has been enough to send him with broken neck and pinion whirling offward. Thus, reader, many a day may be healthily and richly spent whilst waiting for later autumn, the most brilliant time of all.

FRANK WARWICK.

For Forest and Stream and Rod and Gun.

TWENTY-FOUR HOURS AT MILLER'S BAYOU.

BY November the ducks come South, and, enticed by the fine food and *quasi* secluded bayous in Louisiana, any quantities flock hither. But by no means are they safer here than in the ponds of Minnesota or in the marshes of Long Island Sound; indeed, quite the contrary, as the vast and apparently impenetrable prairies are intersected by narrow but navigable passes, which afford the hunter a chance to steal quietly in upon them and create sad havoc among a flock before and as they rise. Sunday is the day for sport, and the hunting grounds most accessible for a day's shooting are situated on the Mobile Railroad. Parties of gentlemen form and go over Saturday evening, returning Sunday night. As we were not to be left out in all this sport, a party met at the train and bought tickets for Lake Catherine. We jumped into a smoking car where our brother sportsmen were chatting in anticipation of a "fine hunt to-morrow," little knowing how miserably the sport would end! So pleasantly did time while itself away in conversation that the howling of dogs suffering tortures at the hands, or feet rather, of a brutal master, did not distract us until the brakeman cried out "Lake Catherine!" where we jumped out and left the hounds and man to proceed en route for deer hunting further north. Though I wish no man evil, I do hope that that fellow, who, to quiet his dogs, stamped his heels on them, failed to bring a buck to bay.

We were hustled into a large skiff which served as a ferry boat between Lake Catherine Station and Millers—a distance of say a mile. Scarcely were we in and seated when someone spied an astronomical and lunar phenomenon commonly known as the "Crescent and the Star." The moon was a crescent, nearly directly over us, and inside of its crescent was as bright a star as we ever witnessed. The night was magnificently clear, the reflections of the moon were bright and silvery and tipped by the twinkling star, we saw, wait, pause, it may never be seen again to again behold. Edward and I, to stalwart darkies, rowed us, and soon we turned into a bayou marked by a signboard as "Miller's Bayou." True, the posts sustaining this guide mark were a trifle off the perpendicular, but save to a geometrical critical eye such an acute angle would not be observed.

In but a very few moments now we came in sight of some neat brick and plastered houses and a hearing of mingled Dutch and Congo "Hold, Alac!" "Pull, Edward," and slowly our starboard touched the little wharf.

"Good evening," said a little dried up old woman whom we immediately took to be the widow Miller—widow I say, for one year previous on that day her husband had been standing just where she was when his gun hammers struck the wharf and both charges were lodged in his lungs, death ensuing. We bade her good evening and went ashore by the combined lights of her lantern and the moon. We walked a few feet and entered her house, a very clean cabin, with a dining room and adjoining two other rooms, each full of bunks for the accommodation of hunters.

She, that is, Mrs. Miller, prepared a supper for us, consisting of trout and wild ducks, the product of the day's pot fishing and trapping. Poles were lodged in the lungs, death ensuing. We bade her good evening and went ashore by the combined lights of her lantern and the moon. We walked a few feet and entered her house, a very clean cabin, with a dining room and adjoining two other rooms, each full of bunks for the accommodation of hunters. We walked a few feet and entered her house, a very clean cabin, with a dining room and adjoining two other rooms, each full of bunks for the accommodation of hunters.

THE AUSTRALIAN CRICKETERS.—The record of the Australian Cricketers in England has been a very brilliant one. Their success has been unprecedented. Meeting the best players in England—and that means the best players in the world, Australia excepted—in thirty matches they have lost only six. Of their matches with English eleven they won five games, lost four and had two drawn games. In contests against odds of eleven or eighteen and twenty-two, they won six games, lost one and drew eight. The one they lost was with an eighteen, in which W. G. Grace played against them. After the defeat at Nottingham—which was to have been expected after the fatigue of a twenty-five thousand miles journey—the victory over the Marylebone and Yorkshires, the games in detail were as follows:

The fourth game was played at the Oval on June 3, against the Surrey County Club, and resulted in another victory. Australia made 110 and 78 for five wickets, Surrey, 107 and 80. Spofforth took eight wickets in the first innings.

The fifth match was played at Eiland, June 6, and was the first match against odds, the home team numbering eighteen. The Australians made 90 and 88 against the eighteen's 29 and 60.

At Longsight the Australians were defeated by two wickets. They scored 67 in each inning to their opponents' 63 and 74. G. F. Grace of the Longsights, scored 33 and 42.

The seventh match was what might be termed the "champion match," as it was against the Gentlemen of England, at Prince's ground. The Gentlemen had perhaps their strongest possible team—viz., W. G. Grace, Gilbert, Horley, Lucas, G. E. Grace, E. M. Gray, E. Lyttelton, A. Lyttelton, Steel, Stace and Bush. The visitors suffered a defeat, making 75 and 63 to the Gentlemen's 189.

On the St. John's Wood grounds the eighth match was played, the Australians beating the Middlesex team by 93 runs. The Australians made 165 and 246 to the Middlesex 122 and 133.

The ninth match was against twenty-two of Birmingham and district, the colonials making 106 and 116 for six wickets against the home team 123 for one inning. The match was a draw.

On June 27 the Australians played at Leeds against a team of Hunslet and district. This match also ended in a draw, but really in favor of the visitors.

On the Monday following they met the County Eleven at Sheffield, and scored 88 and 105, while the County made 107 runs for their first inning, and secured the necessary 20 runs with the loss of but one wicket.

Crossing the border line into Lancashire, their next opponents were eighteen of Stockport and district, and here the Australians were victorious by a score of 163 and 225 to Stockport's 105 and 134.

The thirteenth match was on July 8, against Mr. C. J. Thornton's eleven, at the Orleans Club grounds at Twickenham. The game resulted in a draw.

The next morning the colonials met eighteen gentlemen of South Wales, at Swansea. The Welshmen scored 94 and 88 against the colonials 219, the match being won by an inning and 67 runs.

The fifteenth match was played at Oldham, against eighteen of Werneth and Oldham. The contest was not played out. The totals for the home team were 138 and 117, and for the visitors 123 and 112 for six wickets.

The next match was played at Leicester, where the Australians contested against an eleven of the county. Leicestershire scored 193 in their first inning, the first wicket falling for a 113 runs. In the second inning they scored 145. The Australians made 150 in their first inning, and in the second O. Bannerman made 133 and Horan 40, and finally won the match by eight wickets.

Hull was the rendezvous for the next three days, and the score of the home club was 250 and 68. The Australians made 305 in their first inning—their highest score in England. The remaining fifteen runs were made without the loss of a wicket.

The eighteenth match, at Lards, against the Cambridge University, was won by the latter by an inning and 72 runs. This was one of the most interesting matches played by the team. The Australians made 111 and 102 to the Cantabs 285. Of this number A. Lyttelton made 72 and A. J. Steel 69. On the Australian side Murdoch's 47 was the highest score.

The next game was played at Crewe against twenty-two of the district. Australia scored 130 and 102; their opponents 54 and 79.

Eighteen of Keighly and district were next met and defeated, the home team putting 102 and 135, while the colonials made 308 in their first innings and the remaining 32 in their second, with the loss of three wickets.

The game against eighteen of Rochdale ended in a draw. The Australians scored 159 and 72 and the eighteen 124 and 50 for six wickets.

Buxton twenty-two of the district made 77 and 134 to the colonials 97 and 17 for one wicket. This match was also a draw.

Captain Conway arrived in New York last

Tuesday; the team comes a week from Saturday. The programme of matches in this country has already been published. The forthcoming resume of the international cricket matches played in America is given in the World:

The first English cricket team to visit America were the All England professional twelve, under the captaincy of the renowned George Parr, then the champion batsman of the cricket world. This party left Liverpool for Quebec on September 7, 1889, and began play in Montreal on September 27, against a twenty-two of All Canada, which the eleven defeated by 117 to 85 and 83, while the home side made eight wickets. The English eleven included Parr, Coffin, Lockyer, Jackson, Wisden, Diver, Caesar, Stephenson, Grundy, Hayward and Carpenter, John Lillywhite acting as umpire. They played next on October 3, 4 and 5 against twenty-two of the United States at Hoboken, the team including members of the St. George, New York, Philadelphia, Young America, Albany, Newark, and some other local clubs. The players were Messrs. Gibbs, Earnshaw, Walter, Sam Wright, Harry Wright, Walker, Bage, Sharp, Marsh, Crossley, Wilby, Higham, Cornery, Hollis, Barclay, Morgan, Walter Newhall, Hammond, Lillywhite, Seaman, Leig and Head. This team of nineteen resident English players and three young American cricketers was disposed of in their first inning for a total of about 33 runs, Walter Newhall's 5 being the best made score. In the second inning they made but 54, not a player scoring double figures. Gibbs, the leading batsman of the St. George Club, scored two duck eggs; Sharp, New York, made a total of 10 in the two innings, while the six professionals in the team made but 9 altogether in the first inning. The whole party were frightened by the prestige of the English professionals, and were defeated in one inning by a score of 166 to 38 and 54. Hollis, of Newark, took the majority of the wickets for 30 runs; Coffin, on the other side, took 16 wickets for 25 runs, and Jackson 10 for 17 runs. The English team played another United States twenty-two, at Philadelphia, on October 10 and 12, on the old Camac's Woods Grounds. The twenty-two on this occasion included twelve Americans as follows: Walter Newhall, Philadelphia, W. and J. Wistar, Bayard Hunt, Hall, H. Fisher, Barclay, Waterman and Morgan. In this match the eleven scored 126 in their first inning to 94 by the twenty-two, the latter scoring 60 in their second inning, leaving the eleven to win with seven wickets to fall. Gibbs scored 41 and J. Wistar 19 on the twenty-two side in the first inning, while the home side made 10 in the second. Jackson took the majority of the wickets on the one side and Seaman on the other. The American portion of the twenty-two made 90 runs and the English portion 58.

No foreign team visited America after Parr's eleven until 1888, when another professional team came out under the management of Griffiths. These came direct to New York in the City of Baltimore, arriving September 18, 1883. This team included Jupp, Smith, Shaw, Tarrant, Pooley, Humphrey, Freeman, Raybotham, Charlwood, Welsher, and John Lillywhite, Griffiths umpiring. They played against twenty-two selected by the St. George Club, at the grounds of the latter at Hudson City, on September 16, 17 and 18. The twenty-two included Messrs. Cross, Gibbs, Norley, Earnshaw, Butterfield, Bowman, Pomeroy, Haughton, Cashman, Hill, Stokes, Harry and George Wright, Mortimer, Winslow, Aspinwall, Want, Lee, Smith, Morris, Rogerson and Lancy. The eleven scored 141 but first and scored 175, all getting double figures but two. The twenty-two were then disposed of for 61 in their first inning and 88 in their second, Rogerson scoring 22 and Winslow 11. Norley took 6 wickets for 41 runs and Welsher 13 wickets for 23 runs. The eleven afterwards defeated the twenty-two Boston by a total of 180 to 76 in two innings. George Wright making the highest score on the Boston side—12. In their match with twenty-two of Philadelphia the eleven won with three wickets to fall, by 92 and 83 against 88 and 35. The twenty-two were all young American cricketers. Cadwalader led with 15, White made 13 and Clay 10. In a second match at Germantown the twenty-two were disposed of for 47 and 62, the eleven scoring 117 and 64. In this match Dan Newhall made 20 in his second inning.

On August 17, 1872, the first visit of an amateur team of English cricketers was made to Canada and the United States, the "Gentlemen's twelve," being under the control of Mr. Fitzerald, the Secretary of the Marylebone Club, of London. This team included the renowned W. G. Grace, by courtesy included in the list of "gentlemen players," though really a professional, as he is paid for his services in a match, though he does not attend to ground-keeping or any other duties of a professional cricketer. The other players were Messrs. Appleby, Hornby, A. Lubbock, Francis, Rose, Ottoway, Hadam, Pickering, Harris (now Lord Harris) and Fitzgerald. This team played against twenty-two of New York on September 18 and 19 at Hoboken, and they scored 249 against 69 and 44 by the twenty-two, their winning cause. George Wright was bowled out by George Wright after scoring 63. George Wright got the highest score on the part of the twenty-two, making a six hit over the fence. In the match at Philadelphia on September 21, 23

and 24 the eleven scored 105 and 64 against 63 and 74, the eleven winning by three wickets only, playing their full twelve. Grace was bowled by Charley Newhall in the first innings for 14, and in the second but for 7. Lange led the score on the other side with 13 and 7. J. Hargreaves getting 11 and 7, Clay 4 and 13 and Dan Newhall 13. Grace took 21 wickets for 63 runs, Charley Newhall taking 10 for 63 runs. In the match at Boston on September 20 the twelve were put out for 51 in their first inning, Eastwood bowling Grace for 26. The twenty-two also scored 51, Linden carrying his bat out for 17. In the second inning the twenty-two made but 43 and the twelve had scored 23 with the loss of six wickets, Grace being bowled out by Eastwood for 5, when darkness stopped play and the game was decided to be drawn. The highest score made by the twelve in America was 319 in the match at Toronto, when Grace made 143.

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their TIMING

WATCHES are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIFFANY & CO. are also the agents in America for Messrs. PATEK,

W. & C. SCOTT & SON'S

BREECH
LOADING

W. & C. SCOTT & SON'S

Recommended for Strong Shooting Powers, Fine Finish, Tight Fittings in Action and Locking Parts, and Perfect Proportions Throughout.

Extract from an article by one of the Judges of the Centennial Exhibition, where this gun received highest award.

"The crowning glory of the display was the case of W. & C. Scott & Sons, of Birmingham. This firm has sent more good guns to this country during the last few years than any other, and they especially commend themselves to American sportsmen from the fact that they furnish guns honestly made, of high shooting qualities, at very moderate prices."

Winners of the only International Gun Trial.

At the International Gun Trial, New York, the Committee awarded these guns the Diploma of Merit, being first and second in each of the four classes for points of Merit of Action, Materials, Proportion and Shooting Qualities.

The late feats of Capt. Bogardus with one of these guns, which he had previously shot over 30,000 times, in breaking 1,000 glass balls in 1h. 17m., shooting 1,128 consecutive times, and later in breaking 5,000 glass balls in eight hours' shooting, are splendid proofs of the superior quality and great strength of locking action of this favorite make.

CAPTAIN BOGARDUS IN ENGLAND

Using his W. & C. Scott & Son Breech-Loader, which we furnished him, and with which he has held the **Championship of the World** for years past. The following great matches have been won by him this past summer in England. He has shot **one gun over 55,000 times!**

MESSRS. WM. READ & SONS, Boston:

Gentlemen: I am much pleased with the W. & C. Scott & Son Breech-Loader which you had made to my order. It is the "best proportioned and most reserved" gun I ever owned or used. Its shooting is perfect, and the gun has not been touched nor re-bored since leaving Scott's hands. I can fully recommend the Scott as "THE" gun.

I am yours truly,

A. H. BOGARDUS, Champion Wing Shot of the World.

(Extract from *Bell's Life*, London, on Bogardus' English Matches.)

Capt. Bogardus shot with his famous breech-loader made for him by W. & C. Scott & Son, Birmingham. It is a strong, plain weapon, without ornament, and an "extraordinary killer."

(Extract from the *London News*.)

This now well-tried gun was built for Capt. Bogardus by Messrs. W. & C. Scott & Son, of the Premier Gun Works, and reflects no little credit on that establishment.

MESSRS. WILLIAM READ & SONS, Boston:

Dear Sirs: I have tried and tested the W. & C. Scott & Son top-snap gun, bought of you, and am much pleased with it. I have shot a great many guns in my time, and try to get as good as there is in the market, but I must say that this gun, which I bought of you, gives me the utmost satisfaction in every particular, and I don't meet any one with a better gun.

Yours respectfully,

Gentlemen: I am highly pleased with the Scott top-snap breech-loader, and at the Watertown State Convention I won with it the first prize in the fifteen single bird shoot, being the only one in about eighty entries who made a clean score. I also won the third prize in the double bird shoot, and also the prize for best average made during the convention. I was told by many of the best shots that it killed the birds cleaner, and was undoubtedly the "closest and strongest shooting" gun there. I could have sold it to three different gentlemen. I would also say that Mr. ——— of this place, also won a prize with this gun, and Mr. ———, of Rochester, won with it a private match. I go next week to the Cleveland Convention.

Yours respectfully,

HORACE SILSBY.

(From the same, under date June 18.)

Dear Sirs: I send you a Cleveland paper containing an account of my shooting on the last day of the National Tournament, when I won the second prize of \$400. The gun, as at Watertown, attracted a great deal of attention, and received many compliments for its "wonderful execution." I think you will receive orders for at least half a dozen similar guns. You are at liberty to quote my opinion, which ought to have some weight under the circumstances, as heretofore I have never recommended any gun.

Yours respectfully,

HORACE SILSBY.

Testimonials of similar import we are constantly receiving from all parts of the country; and the best evidence of the worth of these noted Breech-Loaders is the continued and increasing demand for them, which we, as Agents, have met during the past ten years! We have at all times a large assortment in stock of all sizes, 4, 8, 10, 12, 14, 16 and 20 birds of all weights, and will send to any address on approval. Also, special orders executed if desired, such guns being built to exact specifications and ideas.

EVERY GUN WARRANTED IN SHOOTING.

Special Attention is directed to our **New \$50 Grade** of this favorite Top-Snap Action, thus giving sportsmen for this low price a gun of **real worth**. Also all other makes, such as BONEHILLS, CLABROUGH, MOORE, etc., all grades, from \$25 up.

Send for Circulars and our Lists of Fine Second Hand Guns. Address.

Captain Bogardus killed.....42 Mr. Boulton killed.....36

GREAT MATCH FOR £1,000 OR \$5,000.—August 6, 1878, International Gun and Polo Club.—Great match with Mr. Aubrey Coventry for £1,000; 100 birds, 30 yards:
Capt. Bogardus shot with a Scott Choke, 12-bore, and killed 79. Mr. Aubrey Coventry used his Purdey Choke and killed 78.

"Of the many important pigeon matches that have taken place of late years, few have created so much interest as the one under notice; and the contest will be handed down as one of the most exciting ever witnessed."—*Extract from Field*, August 10, 1878.

(Copy of a Letter from Capt. A. H. Bogardus.)

W. & C. Scott & Son: London, August 9, 1878.
Gentlemen: Before leaving England for my home in America, I wish to express my fullest satisfaction in the terrific shooting powers of your Choke-bore guns. I now possess two heavy 10-bore, each with extra 12-bore barrels; also a light 12 and 20-bore; all of your make, which cannot be excelled in the shooting qualities, and impossible to beat in the solidity and power of your Triplex Action. I used your gun in my two recent matches with Mr. Pennell, June 28 and July 23, at which times I scored 70 and 71 in each match, winning by two birds; also in my match with Captain Shelley, July 29, at which time I scored 84, "the highest score on record," and in the international match with Aubrey Coventry, Esq., at Brighton, Aug. 6, for £1,000, which I won by killing 79 out of 100. All of the above matches were at 100 birds each, 30 yards rise. As evidence of the durability of your gun, I have shot one 10-bore over 50,000 times and it is still in good condition.

Believe me, yours very truly,

A. H. BOGARDUS, Champion Wing Shot of the World.

Make"—fourteen foreign competitors and seven American, sustaining our assertion of making the best gun in the world.

Dittmar Powder.

THIS POWDER IS NOW USED BY

CAPT. A. H. BOGARDUS

In all his matches, both indoors and in the field. He uses no other. It was also used in the wonderful performances of

DR. CARVER

At the Brooklyn Driving Park on July 4, 5 and 6, breaking balls at seventy-five yards with a shot-gun.

NO SMOKE, NO DIRT, LESS RECOIL.

Gunpowder.

THE HAZARD POWDER CO MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric Powder."

No. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

No. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

No. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters and 6½ and 15½ lb. kegs. Burns slowly and very clean. Shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12½ and 6½ lbs. and cans of 7 lbs. FFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

Superior Mining and Blasting Powder.

GOVERNMENT CANNON & MUSKET POWDER; ALSO SPECIAL GRADES FOR EXPLOSION OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had at dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

Lafin & Randall Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder.

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6½ lbs. each, and canisters of 1 and 5 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFGG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less residue than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

BLASTING POWDER AND ELECTRIC BLASTING APPARATUS, MILITARY POWDER of all kinds on hand and made to order.

Safety Fuses, Blasting and Platinum Fuses. Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no waste on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot-gun can be converted into a most accurate rifle. THE AUXILIARY BARREL will fit any standard make of gun of 10 or 15-calibre—calibre of rifle 32, 38, or 44, as desired. Length of barrel, twenty inches. The shells used with the best advantage are the Winchester Repeating Arms Co.'s cartridges, No. 32 and 38, extra long, and No. 44, model 1813. Send for a Circular and Price List.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

At the international pigeon shooting, Monaco, Feb. 1878, the Grand Prix de Casino, an objet d'art valued at £100, and a money prize of £100, this the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Cholmondeley Pennell, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 28 yards and 1 foot and 29½ yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record. The winning gun at the choke-bore match, 1877, beating 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Purdy, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 26 birds out of 100, using one barrel only. The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the present day. Patented in the United States, Oct. 4, 1875; No. 163,323. BEWARE OF INFRINGEMENTS OR IMITATIONS.

IRA A. PAINE'S

FEATHER FILLED GLASS BALL.
PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD and ONLY BALL MADE TO A SCALE, therefore we would respectfully call the dealers against laying in a stock of unsaleable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than is charged for other inferior balls. No other ball affords the PLEASURE of the Feather Filled Ball and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.
Every ball is weighed and examined, then packed with the greatest care, in barrels of 200.
Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.
CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.
NEW IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8. Old style, \$6.
Parties buying glass balls will receive, in each barrel containing 200 balls, score book and rules for glass ball shooting, containing 40 pages.

NEW YORK, THURSDAY, SEPTEMBER 26, 1878.

Volume 11.—No. 8.
(No. 111 Fulton St., N. Y.)

For Forest and Stream and Rod and Gun.

Myakka.

AN Indian name, evidently. We do not know the English for it, and presume you do not. So, from our knowledge of the locality and of the customs of our red predecessors to give to a country a title indicating its characteristic features, we may quite safely assume that Myakka means Hunters' Paradise, Deer's Home, Turkey Roost, or—well, suit yourself—any term suggestive of an abundance of game and the best possible place for a hunter to drop into for a month's sport in winter, and you have it as well named as it is at present. We say "drop into" advisedly, for if there is any pleasure in getting to it in any other way we confess to utter ignorance of it.

If you are interested to know what and where Myakka is, take any large map of Florida, and, finding Manatee County, the name will appear connected with lakes and a river entering Charlotte's Harbor. The Floridian gives to all the territory drained by a stream the name it bears, so in the present instance lakes, river and the adjoining country, including a widely scattered settlement, are all known as "The Myakka." With the lakes and river our story runs. The former lie southeast from the enterprising village of Manatee, on the Manatee River, twenty-seven miles from the wharf, where two fine ocean-going steamers land the semi-weekly mail for South Florida. Not very far, one would say, to travel for good sport. Well, it isn't, over a fine road and with a lively team; but good roads and lively teams are not found in this part of Florida. So, upon the occasion that our party of four jolly hunters traveled these twenty-seven miles, an ox-team for our boat and grain, a pony and cart and three saddle-nags were our means of transportation. Our start was made upon a bright morning in December, 1877, one of the mornings when the visitor to Florida from the frozen hills of New England or the bleak prairies of the West finds it impossible to realize that it is indeed winter, and that around his distant home the cold blasts are whistling. With the mocking-birds in full chorus, wild flowers in full bloom, and perhaps heat enough to make coats a burden, it is hard to believe that it can be cold a few hundred miles away.

We had started our ox-team several hours in advance of the party with a darkie driver, whose knowledge, or rather ignorance, of the road was an unknown quantity in his education. So, late in the day we espied our Newburyport "dory," bobbing along over the prairie several miles ahead, and on a wrong trail, heading too far to the westward. "No use to go back," said we. "It's open prairie and pine woods, and we will just cut across in the morning to the right road." So said we in our ignorance of what was between us and that road; and, camping for the night, we made a fine supper from a sand-bill crane the darkie had killed, and some quail we had "taken in" by the wayside.

We have often noticed the fact that the first morning in camp a party will rise fearfully early. Even the all-weather-lazy fellow seems impressed with the truthfulness of the saying, concerning birds and worms, and is perhaps the one to light the fire for our early cup of coffee. It was so in the present instance, and before the sun shone through the pine trees we were marching to meet him and to regain the main road. At noon we were still marching eastward, and had reached no road, with the disagreeable impression intruding itself upon us that perhaps we had better have gone back to the main road upon the trail we followed off; an impression that struck us with all the force of a dead certainty, when about 1 o'clock our cavalcade, with ox-team slowly bringing up the rear, came to a halt against an impassable slough running north and south, or directly across our course, and stretching in either direction as far as one could see. Slightly provoking sight! But how do you suppose we felt, after following that infernal slough four or five miles to the southward hunting in vain for a crossing, to be told by a cow hunter, whom we chanced to meet, that the only crossing was about four miles back, and that we had passed it.

The writer swore, and has forgotten if every one else did. We had driven through as rough a country along the edge of the slough as a cart ever went through, jolting over logs and palmetto roots until the oakum started out of the boat's seams, and to go back over such a miserable track was a trial of patience, indeed.

Our mounted men, skirmishing to the right and left of the crawling teams, found an abundance of jack-snipe and yellow-legs in the edges of small ponds and in wet spots where the woods had been burned a few weeks before, following a dry season, though it must be confessed that the proportion of misses to hits of shots at the swift flying birds was anything but flattering to the vanity of the sportsmen. That the horses had to assume the blame for many a wasted cartridge, was not surprising; they were a little gun-shy. A fox squirrel, hunting for his mid-day lunch, afforded a mark

for the rifle of the weary driver of our pony cart, and added a delicious dish to the dinner, devoured at a late hour within sight of the lakes, toward which our erratic course had constantly tended.

The fatigue and mishaps of the day's travel were forgotten around the bright light-wood camp-fire, and with the smoke of our pipes our spirits and anticipations rose. Visitors to our camp from a not-far-distant farm-house, of the gentlemen well as the sterner sex, helped us to enjoy the evening, and assured us of game in abundance, in return for which assurance we promised the ladies a boat-ride—and never kept the promise. Two of them had never been in a boat, and were filled with admiration of our dory, even as it appeared perched on the ox-cart.

The day's fatigue and extended evening pleasures "told" on our slumbers, so that old So winked merrily at discovering a party of hunters still snoozing under the pine trees as his earliest and brightest ray touched the "Upper Lake." A mile or more away at the foot of a gently-descending slope it lay before us, slightly ruffled by the breeze, glittering like millions of diamonds in the sunlight. A wide border of bright green grass, covering the bottoms that overflow in high water, forms an emerald setting for the lake's brilliants. Bordering the picture, with the irregular and graceful outlines, stand clusters of grand old moss-draped live oaks, stately palms with gracefully pendant leaves, and maples bright with the tints of their autumn season. But for the palmettes, that give to the scene its tropical look, we might for the moment imagine ourselves in the carefully-kept park of one of England's favored landowners, for the hundreds of cattle quietly feeding on the grass keep it smooth and close-clipped as a lawn. No stretch of the imagination, however, could ever picture such cattle as these in "his lordship's" park. Wild, small, and broad-horned, they do not wait for an inspection that would justify a closer description, but, with heads up, go with a rush for the nearest timber. There are over one hundred thousand such cattle in Manatee County that are driven and penned yearly for marking and branding. It is not, then, to be wondered at that the seven hundred registered democratic voters of the county find little time for the adornment of their homes, a lack that the visitor notices at the first glance. With our arrival at the lake our fishing began, and, though it was Sunday morning, we had to catch a bass for dinner. We have read Pennant's *Saxony* for years, and with feelings of most profound self-gratification have compared the fishing, with which some of our fellow-sportsmen (whose exploits are therein recorded) seem well satisfied, with that enjoyed by us at these lakes. Some whose experiences have been there related and read with interest have gloried in a catch of from four to a dozen black bass, describing so vividly every turn and effort of the finny game as to convey to the reader almost the pleasurable excitement enjoyed by the captor.

How we wish for the happy family of description enjoyed by some of these to recount the captures on these pretty lakes and river. A fourteen-foot bamboo rod, stout linen line and big hooks completed our fishing rig. A bit of venison and a wisp of white hair fished from the latter end of our dog's tail made a bait. Just the thing it proved to be for bringing the bass up from the bottom of the cold water. Another good quality it possessed, that of lasting. We caught five with it for four days. Something over twenty of the greedy bass tried to eat it in the course of an hour's talk along the "bonnets," the largest of which we threw back, reserving a half-dozen of the little fellows for frying. And here let us observe, at the known risk of being accused of bad taste and worse judgment, that a black bass is about the poorest fish for the pan or for fun that we know of. He tastes as he smells, which is strong, and we have read with astonishment of his game qualities in Northern waters, of never having found them to any extent in the denizens of our Florida streams, we concluded that the same influence which makes the resident of this "Land of Flowers" easy-going had affected the bass. Of the twenty odd we took seven weighed over nine pounds, and one seventeen, yet there was little fight in them; leading up to the surface like a stick, they would make a dash or two for freedom and give up. Accustomed to catching the salt water fish of the coast, drum, sheepshead, redfish, rovalid, etc., there was no sport in this sort of fishing for us, and we took only enough to eat after the first trial.

It will be said, perhaps the fish were disgusted at the weight and strength of our rig. Well, perhaps they were, and some time we will try them with eight-ounce rod, braided silk line and reel, but we do not expect to find evidence to change our opinion.

We pitched our tent upon a monster live oak near the shore, whose mighty limbs spread sixty feet on every side of the short and crooked trunk. Standing between and up among the low-hanging branches were a dozen palmetto trees, round columns supporting the roof of our leafy mansion.

Pulling from our tree long festoons of gray moss we filled our tent with it half way to the ridge pole and rolled it down for our bed. A rubber blanket, to keep down the moisture, is advisable in this most luxurious couch. As our tent was pitched on Sunday morning, it was resolved to do no hunting, but to spend the day "looking around."

The writer, carrying his "Winchester" (for self-protection) and riding a well broken pony, chose the lake side of

the woods for his field of observation, and with interest noted the flocks of plover that, seemingly fearless of danger, would quietly feed until the pony was within a few feet of them, when, with the unanimity of well drilled troops, they would rise, wheel and settle a rod or two ahead, to repeat the manoeuvre upon another near approach. English snipe—best and sweetest of birds—in countless numbers scooped their soft bills over the half dry mud at the lake's edge; flock after flock of willett rose with shrill whistle, white sandpipers and yellow legs simply ran out of the way, evidently unconscious that an enemy was near. An account of the incidents of this trip has been purposely left unwritten for months, to allow the enthusiasm consequent upon a successful hunt and the sight of acres—literally acres—of game-birds to subside in a measure, well knowing that the unworn truth with regard to the numbers of birds seen would sound like a terribly "fishy" story to many readers unfamiliar with the wilds of Florida. It does seem a little like an exaggerated yarn to say that for half a mile or more the low bushes on one side of the lake were perfectly white with the wood ibis (or gannets, as the bird is commonly called here), and to tell of flocks of white curlew covering acres of the grassy flats might injuriously affect our reputation for veracity. Yet we take these chances, and state that we saw all these, and more too. The beautiful pink curlew (rosate spoonbill) were also feeding about in large numbers, and seeming to value their fine feathers as highly as we did, were more shy than their white cousins, keeping at a safe distance from us, while other birds were not wild at all. We except from this last statement the sandhill cranes. Perhaps the other birds know that it was Sunday morning, and that they were not in danger, on that very account, from the pony or his well-pleased rider who, in watching and counting the rafts of ducks on the lake, scaring up the birds, noticing the lily-pads for future visits, etc., was enjoying in anticipation more than the sport that was to come on the morrow, when the pony stopped, with ears pricked forward and an air of observation generally, told speedily brought attention to the front. Genial! what a flock of turkeys! One, two, three, five, nine—gone, and not half counted. Up that trail to the pond in the hammock. Down drops the pony's trail rope and our observation party of one is as speedily dismounted and transformed into a hunting party as possible. Very strangely, the desire for knowledge of the ground, to be quietly obtained, was changed in an instant to a most positive wish for a turkey at dinner. The caution of a veteran hunter, "Don't hurry," was home in mind (by the way, it's the best advice any hunter could receive), so after fifteen or twenty minutes of quiet walking and crawling the edge of the pond was reached, and with it a sight that would gladden any sportsman's heart. Nineteen turkeys, some feeding some sunning themselves, with outspread wings, in the sand, and all looking plump and fat enough for our Sunday dinner. While lying quietly behind a log, the actions of the pompous "old gobbler" and his family afforded a pleasant study, but, as the rifle was brought to an aim, an old hen remarked "pet," which, being interpreted, is, run, scud, get out of this. She should have spoken sooner, for the bullet reached its mark ere her advice was followed, and one of her sisters laid down her life that we might be fed. Bad man, hunting on Sunday! Admitted, without an argument; but who could resist such a chance for a good dinner.

The following day our party divided up, for a variety of game, one taking a swamp six miles from the lake and river, for deer, two others trimmed the boat for ducks and sculled about the lake, and another, with a resident hunter and his dog, put out for the turkeys that had received attention on the previous day. The flock was found near the same pond, and were quickly flushed by the well-trained dog. Two shots and a turkey—scored on one for our "Cracker" friend and his Kentucky rifle. Turkey shooting on the wing is literally "big sport," with a dog that understands the business. With shot guns it is too easy to be much fun, but with rifles it taxes one's quickness of eye and steadiness of nerve fully enough to be interesting. An hour or so of quiet hunting, enlivened by three successful shots at flying gobbles, and the bag was considered big enough for the day, especially as we judged from the rapid firing on the lake that ducks would be plenty for dinner. The ducking party, however, met with but indifferent success, as the ducks were wild and our dory not well adapted to the sport. Shots at long range were indulged in without taming the ducks much or killing many either—enough for dinner, however.

And here, for the satisfaction of the reader whose experience in wood life will enable him to appreciate the bill fare at that four o'clock dinner, let us give it: Black bass and perch, fried, first course. Snipe and turkey breast, fricassée; stewed turkey; broiled salt; sweet potatoes, boiled and fried; Irish potatoes, ditto; coffee noir.

It would have been a fair dinner, even if we hadn't a "camp appetite" with it; and indeed as we were all greatly "amped" in respect, it was adjudged by the party a first class "spread." Not by all the party either, for the absence of venison from our bill of fare was due to the absence of our deer hunter, whose hungry condition we earnestly commiserate as we smoke our after dinner pipes and see the sun go down and darkness come on without his yet putting in an appearance.

Bedtime comes, and so soundly do we sleep that apparently but a few minutes have passed and daylight comes to wake us to the consciousness of the fact that he is not yet in, but that his horse is and is without his bridle. We "take in" the situation, and in a minute have saddled a couple of horses, roped, the stray nag, who has evidently left his rider in the lurch—or swam, rather—gathered a few fragments of yesterday's dinner, and started to the relief of our unlucky comrade. The crisp, fresh morning air exhilarates us and stimulates our ponies to put their best foot forward. The level, grassy bottoms afford a smooth road, so the six or seven miles that lie between our camp and his hunting ground are gone over in a few minutes, and we enter the big Myakka swamp, swampy, rather, and only covered with water during the summer rainy season.

Winding around among the great live oaks and rough palmetto trees, we ride a mile or more into the thicket, careless of disturbing by the shrill notes of our hunting horn the game we are not seeking. Grave fears for the safety of our friend disturb us as no reply comes to our repeated calls, and with few words and serious faces we ride on, carefully scanning each open glade. Stories of hanging accidents and death from snake bites intrude disagreeably and with oppressive force on our recollection, and the straight column of smoke we finally discern, away through the trees by the river bank, somehow is not reassuring, rising, as it seems, to from a smoldering or dead fire. We ride quickly up to it, with hearts beating audibly, and discover our comrade stretched out on a pile of moss—sound asleep and the sun an hour high. W. S. WARNER.

Manatee, Fla., July 10, 1878.

Fish Culture.

THE LOTUS FOR FISH PONDS.

CLEVELAND, Sept. 10, 1878.

EDITOR FOREST AND STREAM:

Among the numerous native aquatic plants described of late in the *FOREST AND STREAM*, as adapted to the aquarium, fish pond and stream, I have not seen the attention of fish culturists called to the most magnificent of all our water plants—the nelmumbium (*Nelumbium luteum*) commonly called the water chinquapi. This nelmumbium is the largest and most beautiful water lily of the northern zone. It is allied to the *Nymphaea speciosa* and the *N. lotus* of India and the Nile; it can rightly be called, on account of the size and beauty, the Victoria Regia of the North. This plant is found in many isolated marshes in the West. Those under my own observation are at the west end of Sandusky Bay, on Portage River, that empties into Lake Erie at Port Clinton, West Harbor, on Lake Erie near the mouth of this river, and in Point Au Pelee Island marshes on the north shore of the lake.

In the quiet bays of these localities this lily could once be seen growing in patches of from one to five acres, its broad green leaf, twenty to thirty inches in diameter, on stems two, three and eight feet long, covering the water entirely from view. The blossom, which comes out in August, is from eight to ten inches long and shows a pink well above the water. The seeds, from fifteen to twenty in each capsule, ripen in October, and are about the size, form and color of the "black-jack oak" (*Quercus nigra*) and with the root of the plant, which resembles much the root of the sweet potato or yam, were both used as food in early times here by the Indians, and cultivated, it is said, by them. From my own experience I can hence affirm that they are quite edible.

For deep water and ponds of great extent I consider this lily (*N. luteum*) of more value to the fish culturist than the sweet scented variety (*Nymphaea odorata*).

Some years ago a friend requested me to procure skins of the male woodcock, *Anas sponsa* (Audubon), as he wished to send the feathers to a salmon-fisher correspondent in Scotland. Having noticed numbers of these birds on October evenings alighting in a small pond in the woods of "Mid Bay," a continuation of the west end of Sandusky Bay, I procured a boat in that one day about sundown, and soon procured thirteen male birds in passable plumage. I found, on skinning them, their crops filled (as I supposed) with acorns, and not until a half-bred Frenchman proved to me that they were the seeds of lily pads did I discover my mistake. From that time I have ever been interested in the history of this magnificent plant. Since the above was written I have been told by "Colonel Dyer and Eldigan, too," but twice like the beating of a thousand gongs and twice ten thousand bass-drums combined. In the afternoon in early October you could see the gallinules, rails and March wrens running and flitting over these water carpets, while under them, in the clear and shaded water, thousands of pickerel, bass and sunfish took their quiet siesta on their morning meal.

Since the above was written I have had brought to my notice two newspaper articles on the nelmumbium.

The first, from the Green Bay (Wis.) *Advocate*, as follows: "The Egyptian Lotus, so celebrated for its rare and beautiful blossoms in flavor and color, have until quite recently been known to exist at all in the United States, but are found in great perfection in several places in this country—one of which we discovered last week to be in Lake Winnebago, near the Insane Hospital, and probably at some other points on the lake. It grows also at Sheldon's Cove, on the Connecticut River, not far from Long Island Sound, and its rare and beautiful blossoms are always in great demand there, from \$2 to \$10 having been offered for them. Every effort to transplant the plant has been unsuccessful, and it has been heretofore believed that only one spot elsewhere on the North Carolina coast—now that idea is exploded. The origin of the lotus at Sheldon's Cove is attributed by tradition to some seeds which blew from a shipload of Egyptian rags passing up the river. The blossoms on the Lake Winnebago specimens are of a delicate, pale buff color, and larger and finer in texture than the ordinary pond lilies of this country."

The second is from the Cleveland *Leader*:

"In your issue of yesterday, you reprint an article from the Green Bay *Advocate*, in which it is claimed that the famous Egyptian lotus has been recently discovered in Lake Winnebago, and it is said to occur at only one other point in the United States, Sheldon's Cove, on the Connecticut River, where its presence is attributed to 'a shipload of Egyptian rags passing up the river from which some seeds blew into the water,' etc. etc. As the plant referred to in this article is not the Egyptian Lotus; is found at several localities in this country, three of which are in this State; is one of the most beautiful and interesting species in our flora, and has a close relationship to one of the many so-called Lotus plants of the Old World, I venture to send you a brief note of comment upon it. The plant mentioned in the *Advocate* is *Nelumbium luteum*, or, as the Chinese call it, the largest and finest of our water lilies. Aside from the localities mentioned, it occurs at Sodus Bay, Lake Ontario, on the islands in Lake Erie, at Toledo, at North Bend on the Ohio, and at some other places; and yet it is a rare plant. It will be recognized by its circular, peltate leaf, often two feet in diameter, which floats on the surface of the water, and by its great fragrant flowers, pale greenish-yellow in color, sometimes leaving a flush of red, and its seeds are held in a flattened receptacle three or four inches in diameter, are nearly as large as hazel nuts, and are eatable. Visitors to the islands will find these lilies in the marshes of Middle Bass, and in much greater abundance at More's Dock, near Ottawa, on the peninsula. Both the root and the seeds were used as food by the Indians who formerly lived around the western end of Lake Erie; and it is probable that it would richly reward efforts for its cultivation in this vicinity, both by its beautiful and deliciously fragrant flowers and its edible, nut-like seeds. Our *Nelumbium* is closely allied to *N. speciosum*, which grows spontaneously in India; and, like the papyrus, was formerly cultivated in the Nile, but does not now grow in Egypt. This is sometimes called the lotus, but the true lotus was *nymphaea* (*N. lotus*), a species of the same genus with our white water-lily (*N. luteum*), and very much like it. This grows abundantly in the Delta of the Nile, and both the immature seed pod and the root were eaten by the Egyptians. This and the *Nelumbium* were accurately described by Herodotus, and there can be no mistake about them. The blossoms of the white water lily of the Nile, and also those of the blue species (*N. caerulea*), which grows with it, were highly esteemed by the flower-loving Egyptians, and were used by them to decorate the tables at their feasts, and to crown and garland the guests. They also formed a conspicuous feature in the offerings to their gods. There is considerable difference of opinion among scholars as to the identity of the plant which bore the fruit said by Homer in the *Odyssey* to have been offered to Ulysses in North Africa, and to have the peculiar property of producing forgetfulness of home and country in those who ate it. It certainly was not our white water-lily. It grew abundantly in the Delta of the Nile, and was probably the fruit of *Ziziphus Lotus*, a small tree which grows in Barbary. This fruit is something like a date or plum in appearance, and the Arabian poets ascribed to it a lethean influence similar to that felt by Homer's *Lithophagi*."

I hope sufficient has been said here regarding this water plant to induce some of our fish culturists to undertake its cultivation. Should any such want the seeds or roots I have no doubt they could procure any amount needed by applying to the members of the Hone's Point or Winnow's Point Clubs, located at the head of Sandusky Bay. Both clubs have men in their employ that would willingly collect the material for a sufficient compensation. DR. E. STREILING.

EGGS OF THE CALIFORNIA SALMON.—Mr. Livingston Stone's efforts this year at Baird, Shasta County, California, seem to have been crowned with success. It would be well if the various Fish Commissioners would at once apply for eggs for their use. Mr. Stone writes from the U. S. Salmon Breeding Station at the above point, under date of Sept. 11:

We have taken eight million salmon eggs this season, and have a good prospect of taking three or four million more within a week.

This expectation of a further catch seems to have been fully realized, as we are in receipt of the following news from Professor Baird, who writes from the United States Commission, Fish and Fisheries, Gloucester, Mass., Sept. 21:

Stone telegraphs to-day that he has taken twelve millions of salmon eggs, and can get plenty more. This is beyond the sum of all applications.

TROUT EGGS.—A very large number—one million—brook trout eggs are for sale by Messrs. Eddy, Randolph, N. Y. See advertisement.

FOR *FOREST AND STREAM* will be sent for fractions of a year as follows: Six months, \$2; three months, \$1. To clubs of two or more, \$3 per annum.

Natural History.

For Forest and Stream and Rod and Gun.

MARINE MONSTERS OF TRADITION AND FACT.

THE periodical "newspaper appearance of the sea-serpent," by virtue of its romantic surroundings, has become an old stand-by, and is looked for and read with a patient credulity that is worthy a better cause. Day after day these monsters are hurled at us by the fun-loving "ink fiend," and it is safe to say that if a shoal of antediluvian horrors should enter the harbor at an early date, they would catch but little surprise to the hundreds who are continually being primed and double-shot with an earnest belief in their existence. Next to the great sea serpent, the devil fish has been the great theme of those who go down to the sea in ships, and even Victor Hugo's wonderful tale of the octopus and its great size has long since been verified by the appearance of a relation of this creature at the New York Aquarium, where it lies in state, its immense arms, thirty feet long, armed with dead-dealing suckers, almost substantiate the tales of the "Tollers of the Sea." So, perhaps there is still a

chance for the "serpent." We expect him, and he will undoubtedly soon put in an appearance at the Aquarium, perhaps in sections, but still there where he will be introduced by "Tody Hamilton" into the mysteries of very alcoholic fire water and "what oysters know about following a man around the room." The curious effects of these strange stories (on the future) can be seen in the numerous statements in history to date of appearances that are there recorded as facts. So, many of our yarns of to-day in a hundred years will be unearthed and wondered at by the half-doubting reader. Some of the later day notes taken upon strange creatures are extremely interesting, to show how the reason of a perfectly reasonable creature can at times be distorted. So, the attention have these appearances been given to Sir Charles Lyell, P. R. S., etc. etc. made quite a report of them, and in most cases the statements were sworn to, and in almost exactly as many cases they were shown to be the result of natural and not unnatural causes. In 1843 scientific Boston was most shamefully deceived by a Mr. Knock, who exhibited a real "sea-serpent." It was supposed to have been only thirty feet in circumference, but was finally found to be a *Python*, an extinct crocodile of great size. It was most carefully made up, the vertebra of several of them being joined together, making a snake of over one hundred feet in length. Soon after this—August, 1845—we have the sworn statement of two gentlemen of Merionist, Nova Scotia, who state that they saw a monster, eighty feet long, hard ground within a hundred yards of the beach, and after watching its motions for an hour, they saw it move off. One of the men mounted a high bank, and stated that it raised its head high out of water and its back was covered with lumps, or they were caused by the motion of its body. The skin was dark and rough, and it worked about continually and would bend its body into a circle and unbend it with great rapidity. In 1844 a large creature swam past a wharf at Arisaig, near the northeast end of Nova Scotia, and was observed by Mr. B. Barry, of the wharf, who certified that he was within twenty-five feet of him, and that it was over sixty feet long and three in width. The back was covered with lumps or natural ridges. The above evidence was collected by J. W. Dawson, of Pictou, for Sir Charles Lyell. In February, 1846, Capt. Lawson and crew, of the schooner *Mary Bell*, stated that they passed a monster snake off Cape Cashes and Henry. The length was given at one hundred feet (and not an inch over), and the creature was seen in the medium of sight. In the month of August of this year, and of July, 1845, articles appeared in the Norway papers giving a description of a monster fish or creature seen by many people, and giving the names of surgeons, lawyers and other prominent men who had certified to the veracity of the statement. The animal was seen in the vicinity of Christiansund, and also at Molde and Lofoten. It entered the bay on calm days, and was seen to be over seventy feet in length, of a black color, smooth, and about three feet in circumference. It moved through the water like an eel, and came so near the beach that its waves broke upon the sands at the feet of the wondering crowd as if a steamer had passed. On the neck, hair was observed that waved like a mane in the water.

It was also pointed out, in the report, that the people who saw it were not frightened, but "it entered the water with ease and reason," and fired shots at it, some of which must have taken effect, as it dove and moved away.

In the years 1817 and 1820 a large marine animal made its appearance upon the New England coast, especially between Gloucester and Boston. These visits created so much interest that the Linnean Society of Boston appointed a committee to investigate the matter, and in 1820 Messrs. Dr. Bigelow and F. C. Gray, two well-known gentlemen, made the report (and it has clung to them ever since). It was as follows: "The monster was from eighty to ninety feet long; its head usually carried about two feet above the water; of a dark brown color, the body with some thirty feet or more protuberances—compared by some to four gallon kegs, or closer to a string of hogs; motions very rapid, faster than those of a whale, swimming a mile in two minutes, and sometimes more, leaving a wake behind him, and chasing mackerel, herrings and other fishes, which were seen jumping out of the water, fifty at a time, as he approached. He only came to the surface in calm, bright weather. A skillful gunner fired at him from our boat, and, having taken good aim, felt sure he must have hit him on the head. The creature turned toward us, and dived under the boat, and reappeared a hundred yards away."

Such was the report of the scientific men of fifty years ago, and having made it, they termed it *Scophthalmus atlanticus*. Drawings were made of it on the spot by Colonel Perkins, of Boston. He saw more and further than all his colleagues jointly, as he mentions twenty projections eight feet apart, and counted the scales by a large majority. The drawing he made resembles the one given in the "History of Lynn," Mass., and was one of thirty persons who followed it along the beach as it swam along the shore. It is to be supposed that it was not then moving at a rate of a mile in two minutes, as above reported. Gentlemen are still residing in Lynn who were of the party, and the writer is fortunate in having an old and valued friend who was a spectator, and to the present day he still avows that it was really the great sea serpent, and not an animal, as he says. In 1806 Captain Johnson, of New Jersey, was becalmed off Hatteras, and reported seeing an immense snake, that raised its head and moved off like an eel. The sea serpent has often been confounded with other marine animals, as in September, 1808, a huge monster was thrown ashore on the outside reef at Rothesford Head, in Strousa, one of the Orkney Islands, where it was found, and measured fifty-five feet in length. The skin, the history, and the others were taken and published in the "Nemurian Society." It measured fifty-five feet, and had bristles in the main, each fourteen inches long. This was so confounded with the Norway sea serpent that it was named *Halargyllia pontopiddani*. Afterward the scapula arch and vertebral column were sent to the Edinburgh Museum of Comparative Anatomy, and pronounced by Dr. Barr to belong to an animal, and not a snake. Some months after other portions were forwarded to Sir Evered Howe in London, who at once pronounced it to be the *Squalus nazarinus*, but of unusual size, as the longest then known was thirty-five feet in length. When hair commenced to grow upon sharks the historical facts to state. In this year, in answer to a request, the Rev. Donald Maclean, of Small Isles, in the Hebrides, wrote a statement of

The Kennel.

MINNESOTA FIELD TRIALS.—Owing to failure of the mail, the conclusion of our report of the Field Trials did not reach us in time for last week's paper, and we append it herewith, containing the Thursday's paper for Dogs of All Ages:

Thursday, P. M., Sept. 12th.—After dinner Clipper and Jennie were put down (3:45) working in grass with a flush for Jennie almost immediately. After a little Clipper weakened and was ordered in. Friend was then put down. Friend is an imported red Irish setter (Flash-Stella). Entered a stubble field surrounded by prairie and worked it patiently without result. Ground so situated was usually excellent for trials. Thence into grass and then into stubble, and so on until 5:45, when a flush was scored to Jennie's account, which took her up. Queen of the West took her place at 6 o'clock, and no birds showing, the dogs were taken up, and the trials adjourned until Friday, all hands overworked and the business growing decidedly monotonous. Seven singles and three braces remain to be run. As we returned to camp myriads of wild ducks filled the air flying from their feeding grounds in the fields to the ponds and sloughs.

Friday, Sept. 13.—Morning frosty, bright and clear; wind light, southeast; 12 M., wind south and brisk; 6 P. M., clear and calm.

Friend and Ranger were put down at 8:30 A. M. and soon cast off in a prairie near camp. Ranger is a seven-year liver and white ticked pointer, well known as one of the best dogs in the country, very steady and a hard worker. Presently the dogs moved into stubble, Friend working slowly and determined not to risk a flush. Ranger justifying his name. Almost immediately Ranger found. Soon after a covey of a dozen got up wild; no score. Ranger afterward carried two points in an old rag-weed field. Large flocks of wild geese rose from a "break" (newly plowed land). Now across a mile of prairie, and thence into stubble. Poor Friend is foolish, preferring furrows to straw stubs. Ranger gets a flush on the edge of a prairie due to carelessness of handling, walking in after he had established his point, but earns a point five minutes later. Friend also carries a point and is taken up at 10:15 with a full score of five points. Ranger goes up at 10:30, and Maggie May, a black, white and tan imported English setter, and George Waddington's Nellie are put down. Nellie wins well on the edge of a dry slough, roading carefully, and trailing a circling bird, and won a brilliant point. Dogs taken up to change to distant locality, and are put down again on prairie at 11:15, both quartering beautifully, and going at a great pace, thence into stubble and weeds until 6 o'clock, on the edge of a prairie, Maggie coming to a point first and scoring. At 11:50 Maggie earns another point in grass. Birds scarce, lie very close, single, and when they rise fly the regulation mile before settling. Gophers very numerous, rendering false points liable. Gopher mounds are the central structure from which the burrows of these pestilential rodents radiate. They are usually two feet high, ten to twenty feet in diameter, and covered with tall weeds. There are also badger mounds. Hawks are constantly sailing over the prairie and pick up many chickens. At 12 M. another pretty point for Maggie May, who shows most excellent nose and staunchness and good roading. (Taken up at 12:30 for dinner.) Dogs put down again at 1:45. Nellie gets two flushes and is taken up. Maggie earns a flush at 2:50, and is withdrawn. Countess Royal, a liver and white pointer, and Strathroy, a setter, are put down and work until 6 o'clock. Countess scores two flushes and two points and is withdrawn, becoming sick and unfit for work. Strathroy runs out with four points and a flush. Dan withdrawn.

The Brace Stakes, for which there has been three entries, were set aside and not run, for want of time. Broke camp Friday night. The following is the score in the All Ages Trial:

NAME.	SCORE OF POINTS.										Total.
	Each Point.	Picking 1 to 10.	Pick 1 to 10.	Stays 1 to 10.	Quarters 1 to 10.	Shooting 1 to 10.	Shooting 1 to 10.	Shooting 1 to 10.	Shooting 1 to 10.	Shooting 1 to 10.	
Snap	16	3	0	0	3	3	0	1	1	1	40
Daisy	20	0	0	0	4	4	0	0	0	0	44
Clipper	1	10	0	0	0	0	1	0	0	0	11
Jennie	1	0	0	0	0	0	0	0	0	0	1
Friend	6	5	0	5	4	4	0	0	0	0	33½
Queen of West	1	10	0	0	0	0	1	0	0	0	21

Strathroy	20	0	0	0	0	0	0	0	0	0	20
Jack, withdrawn	0	0	0	0	0	0	0	0	0	0	0

There is a probability that Friend will be protested, as he was withdrawn before the Trial was run; in which case he would not be entitled to either record or place.

The Minnesota Kennel Club have been very fortunate in the selection of their judges, who had a difficult and thankless task. No greater care could have been taken of the interests of the competitors, the judges disputing fractions of points on the merits of the dogs. Had the birds been abundant, and the weather more auspicious on the first day, the Trials would have been more enjoyable. It is seldom that so many superior dogs have met in competition in this country, most of them being owned by professional breakers and breeders. The camp caucen was well managed by surveyor Charles Benson, proprietor of the West Hotel at St. Cloud, and the table was all that could be wished or expected. Sufficient teams were provided for spectators. Probably one hundred persons in all witnessed the Trials; but on the last day the judges, handlers, and two reporters were all who witnessed the fortunes of the field, and wearily followed the dogs through stubble, break, slough, and prairie.

DOG HOLERS IN NEW YORK.—Our most trustworthy English newspaper, the *Life Stock Journal*, has an excellent article on the dog dens of London. It speaks of the miserable places where dogs are kept by dealers on sale as "hot beds of disease, engendered by filth, overcrowding, and the abominably disgusting food supplied to the unfortunate creatures confined."

"Strathobie" writes that in a place five feet wide by five feet ten inches in length there were fourteen dogs of different sizes, confined in cages in which they could not turn themselves. Such cases of wretched cruelty, we regret to say, are not uncommon in New York. We know of one place where, in about a space of ten feet by eight, we counted sixteen dogs, some of them of good size, three cages of rabbits, two with Guinea pigs, besides numberless coops and crates filled with chickens and pigeons. The odor was simply horrible. As we approached the den it was sickening. That such an unwholesome hole must breed a pestilence seemed to us to be very certain. The use of the simplest disinfectants is apparently unknown to the people who keep these dog holes. We often wonder where the proprietors find any money in the business. Animals or birds in such an atmosphere must sicken and lose condition. There is no doubt but that a great many of these dog dives in New York, as in London, are receptacles for stolen dogs, and that the poor poultry exhibited are simply blinds. Strange to say prices asked at such dog dens are most preposterous, generally three to four times more than the value of the dog. It is, however, very rare that a good animal can be found in such places at all. We do not mean to be general in our remarks, for we are pleased to state that there are quite a number of dog dealers in the city who have toy breeds, who keep their places in good order, and where animals are kindly cared for. All such places of bad repute ought to be put under surveillance. The question of dog-stealing is, of course, one that should be summarily dealt with; but in close September weather, unless such dens are purified, the health of a whole neighborhood may be endangered.

TREATMENT OF DOGS WHEN ILL.—We take the following from an article by Dr. Gordon Stables, contributed to the *Reading Mercury*: "There is a disease known as distemper, about which not a little misunderstanding prevails among people generally. It is believed that all dogs are bound to have it once, and once only. This is wrong, for in well-kept kennels it is exceedingly rare; on the other hand the same dog may have it more than once, and that, too, when quite old. Distemper is really a catarrhal fever, ushered in with some degree of shivering, dullness, loss of appetite, running of water first, and pus mixed with blood afterwards, from nose and eyes. There is also rapid emaciation; this latter symptom distinguishes it from a common cold. There is, too, snorting and coughing in distemper. The disease should be met at the outset with an emetic, such as a teaspoonful of mustard in warm water, followed, or not, by some camomile tea; then get the bowels to act by the common buckthorn and oil mixture; dose, from a dessert-spoonful up to two table-spoonfuls. If the cough seems very troublesome, a scion may be put in the front of the chest. For the first two or three days, from two to ten grains of James' powder should be given three times daily, with a dessert or table spoonful of Minde-rus spirit at bedtime. You must sustain the system as soon as the fever is abated with nourishing soups and port wine, and, to complete the cure, give quinine, from half a grain to two grains twice a day made into a pill, with from two to five grains of extract of dandelion; cod-liver oil must then be given for a month; dose, from a teaspoon-pow up to one ounce twice a day. I know of no more excellent remedy for weakness of all kinds, either for grown dogs or pups, than cod-liver oil. I invariably use the light brown; it is the dearest, but in my opinion far away the best. Dogs are often troubled with diarrhoea, and, as it may merge into dysentery, it should be speedily seen to, especially in warm weather. It is usually an effort of nature to expel some irritant substance from the bowels; a dose of castor-oil will, therefore, assume the action, with a few drops of laudanum to ease the nervous system. Chalk mixture may then be given three a day, or oftener, and rice and milk as food. When the reverse is the case, and costiveness occurs, a run and a dip in the water will often effectually relieve it. If the dog seems in distress administer an enema of warm water, with half an ounce or more of castor oil in it. Constipation in the bowels is usually produced by want of sufficient exercise, errors in diet. When we know we have the remedy clearly set before us, give more green food, and exercise and exercise. Medicine may relieve, but cannot cure, a constipated habit either in man or beast. Colic is a painful affection in the dog, and is often brought on from cold, constipation, or the eating of indigestible food. The dog is uneasy, constantly changing his position, and giving vent to piteous howls. The indications of treatment are two: ease the pain and act on the bowels. Give at once some brandy and water, with from ten to twenty drops of laudanum in it, and shortly after a good dose of oil, aiding its action with an enema. Dogs, as well as their masters, suffer often from indigestion, generally brought on from lazy habits and over-indulgence of too luxuriant appetites. The fault may be the owner's; he may feed the animal between meals, cram him with tit-bits, dose him with dainties, or let him gorge himself on that greasy garbage—greasy gravies. And so the dog grows fat, and fat is in itself a disease, his nose is unhealthy, and his sleep disturbed by fearful dreams. To cure him, feed sparingly and rationally, give an occasional aperient, and a daily dinner pill of quinine, rhubarb and taraxacum, and a bucket bath every morning. I must at present pass unnoticed the more serious internal inflammations, such as nephritis, bronchitis, hepatitis, pleurisy and other diseases of the lungs, as well as jaundice, the latter being especially common in small and yellow jack itself, and proper advice should be sought as soon as it appears. In all acute diseases you can seldom do wrong in at once getting the bowels to move, applying counter-irritants to the seat of pain, and hot fomentations or the hot flat-iron, and administering repeated small doses of opium by the mouth. Mangle is too well known to need a description. The dog should be washed twice a week, using Spratt's soap, and after each washing anoint with the following liniment: Mix four drachms of creosote with seven ounces of olive oil, and add one ounce of solution of potash. Change the dog's bed often, alter the diet, give an occasional aperient, and from three to drops to eight (according to size of dog) of liquor arsenicalis twice or thrice a day in the food for two or three weeks, unless it brings on redness of eyes; if it does, omit for a day or two, and begin again."

what he witnessed and knew to have occurred in that vicinity relative to a sea serpent. He stated that in June, 1898, he saw a huge creature from the shore and from a boat. "Its head was wide and oval, neck small, and it moved swiftly, with a snake-like motion. Sometimes the head was out of the water, and then the speed seemed to decrease, and its object was evidently to see; and at one time it dived furiously under and pursued the boat." Again he says, "We saw it from the shore, and it moved off about a mile, and we lost sight of it. Its length we believed to be from eighty to one hundred feet. Afterward it was seen between Round and Parma, its head above water and moving along at about five miles an hour."

One point in their favor is that the descriptions agree in almost every case, those of Norway and America being about the same. Hundreds of arguments are brought up. The inability of men to judge when frightened, is one; but in New England it was observed by men who were entirely composed; again it has been compared to a line of porpoises, but these could not raise themselves in the air after the fashion of this alleged monster. These questions are answered by Sir Charles Lyell, whose theory is that the sea serpents are in reality large specimens of the *Squalus maximus*. He says: "Dr. Melville informed me that he saw a large species of shark swimming at a rate of ten miles an hour in the Torres Strait, and besides the lateral flexures of the tail, which are the principal propelling power, the creature described as it advanced a series of vertical undulations, not by the actual bending of the body itself, but by the successive animal rising near the surface and then dipping down again, so that the dorsal fin and a part of the back were occasionally lifted to a considerable height. So, if a large shark was moving at a rate of twenty miles an hour, that portion of the back that emerged in front might easily be taken for the head, the dorsal for the mane, and the waves formed by the rising of so heavy a body complete the humps. Again, if the fins should emerge and be submerged in those fantastic beings who have seen and would be retained on the retina of the eye after another set had become visible, and they might be continued over and over again indefinitely." The extending of the head out of the water has been laid to the *Phoca proboscidea*, or sea elephant, which sometimes grows to a length of thirty feet, but it is a question whether the animal could move for hours with its head so high. So it will be seen that there are many points of similarity in these fantastic beings who have seen and do not like to deny it, as it would be casting some reflection upon the word of a convinced (?) colleague. However, we live in hope, and fondly expect some fine morning to see the Brooklyn Bridge clasped in the slimy folds of the great unknown.
New York. C. F. H.

OSTRICH BREEDING.—The value of ostriches has very largely increased of late. The London Colonies and India gives the price of some ostriches sold at Middlebury, South Africa, for breeding purposes, as £285 a pair. Twenty pairs of breeding birds averaged £130. Fine feathers are worth as much as £67 per pound, or about fifteen shillings for each feather. When it is remembered that a few years ago ostriches could be procured in South Africa for the catching, and were purchased for a mere trifle for exhibition purposes in this country, whereas at the present time a live ostrich does not exist in London, the importance of the birds on the ostrich farms of Cape Colony may readily be realized. Northern African birds do not possess the fine plumage of the Southern varieties. Why should not Bird of Paradise culture be attempted? It is quite possible that in New Guinea some of the finest of the *Paradise* might be produced by artificial incubation. Who would like to go into the business? The only trouble is that the ladies are inconstant in their fashions, and the rage for Bird of Paradise feathers might be at fever heat one year and "horrid" the next.

THE POMFANO.—Our few remarks in last week's paper on the pomfano might be conducive of error if more thoroughly explained. Linnæus called this fish a *Gasterosteus*. Of course this resemblance was but superficial, and is not recognized to-day. The pomfano has nothing to do with the stickleback, all its relations being nearer to the mackerel and caranx. All of these were once considered to be member of the genus *Gasterosteus*.

—The head gardener of the Maharajah of Tohore undertook to take liberties with the python, and kicked the box. Like lightning the python wound himself around that Singapore gardener and almost squeezed him to death. A private of an English regiment came to the gardener's aid and managed to take the hitches out of the snake. Don't fool with a python.

BEES FOR NEW ZEALAND.—Insects play an important part in floral economy, and a curious bit of agricultural enterprise, based upon this principle, comes to us reported from New Zealand. The principal object was to get a considerable sum of money in acclimatizing the humble-bee, so as to assist the agriculturists in cultivating clover. Common bees are not strong enough to force their way into the petals of the clover flower, and thus fertilize the plants as they fly from one to another. For this purpose, therefore, the bees, based upon this principle, but so far the nests sent out have been destroyed. Attempts to acclimatize the common bee in some hot climates have so far proved useless. After a short period they quit the hives, and cannot be enticed back.

A TEAM OF ELE.—A novel feature of the State Fair at St. Paul, Minn., the other day, was the team of elk driven by Mr. A. I. Moore. The animals were captured about two years ago on Rice River, eight miles south of Fargo, Dakota when four or five days old. "Dexter" weighs 512 pound, and "Dasher" 500 pounds. They are well broken to harness thoughly trained and gentle. Their speed is sixteen miles an hour.

—At Merthyr Tydfil one of the great events of the year is an athletic meeting on a large scale, organized by a society of licensed victuallers. Because of the large number of men attending took places this year public prayers were offered up in several chapels that rain might be sent to spoil the sport.

carbines, of the National Guard or uniformed militia from each State or Territory of the United States. Teams to appear in the authorized uniform of the organizations they represent (full dress or fatigue), and the members thereof to be certified by the commanding officer of the regiment, battalion, separate troop or battery that they are active members thereof, and were such on June 1, 1878. Distances 300 and 500 yards. Position, standing at 200, kneeling at 300 yards. Weapon, the carbine with which the organization represented is armed. Rounds, five at each distance. Entrance fee, \$1 each man. Five teams entered—three prizes:

No. 10—"ARMY AND NAVY JOURNAL" MATCH.

Open to teams of twelve from all regularly organized military organizations in the United States, including the Regular Army, Navy and Marine Corps. All competitors to be regularly enlisted members, in good standing, of the regiment, battalion, corps or troop they represent, and to have been such on June 1, 1878, and to appear in the uniform (full dress or fatigue). Weapon, Remington State military rifle; distance, 500 yards; rounds, seven; position, any, within the rules. Entrance fee, \$1 each competitor. Nineteen teams entered; one challenge cup for first prize, with second and third prize of statuettes.

No. 17.—INTER-STATE MILITARY MATCH.

Open to one team from each State and Territory in the United States, consisting of twelve members of the regular organized and uniformed National Guard or Militia of such

ory, chosen in such manner as shall be pre-

senior by the military authorities thereof. Each team must be provided with a certificate from the Adjutant-General of the State it represents, certifying that each of their number is a regular member of the uniformed militia, in good standing, and was such on the first day of June, 1878. They shall appear in the uniform of their corps. Distances, 200 and 600 yards. Position at 200 yards, standing; and at 500 yards, any. Weapon, any military rifle which has been adopted as an official arm by any State or Government. In cases where the State has adopted no particular model (which must be certified

ant-General), the team will be allowed to use the model.

the time in use by the regular army of the United States, or by the uniformed militia of any other State. Rounds, ten at each distance. Entrance fee, \$2 each man. Five States represented—one grand prize and two medals.

been finer than the long-range match of the champions for the Leech Cup. It was a galaxy of the best long-range men in the United States—may we not say in the world? There was an easy way about it, a methodical manner of loading, a quiet repose of position, and the result was bull's-eye after bull's-eye. No fluster, no press, no anxieties—only great calm, fixity of purpose, and the bang of the rifle.

THE RIFLE IN COURT.

The testimony given by Mr. Charles D. Leet, at Ballston Spa, in the trial of Jesse Billings, Jr., for murder, was of a most interesting character, and shows how thoroughly the subject of arms and ammunition has been studied. Mr. Leet is an expert in the manufacture of cartridges, having been employed at Bridgeport, Connecticut, and having worked in the Ordnance Department in Vienna. It became necessary for the jury to be made familiar with the character of the projectile discharged from the arm as to being fired from a pistol or rifle, and whether a conical or round ball had been used. One quite curious point was the determination at what distance the arm was fired which resulted in the death of a woman, and also if certain marks on a window sill were due to imperfectly burned powder. It might have been possible that some arm other than a carbine which had been found in a well had been used. The carbine produced in evidence was declared by Mr. Leet to be a Ballard .44, and after certain marks on the ball had been examined, the expert declared the ball to be one fired from a carbine, and not from a pistol. The weight of the lead taken from the skull of the victim weighed 165 grains—when whole the bullet weighed 220 grains. The grooving on the lead being wide, Mr. Leet was positive that it could not have been fired from a pistol. As to the powder marks on the windows the expert deposed as follows:

He thought that the residuum of powder might be found at a distance of from forty to fifty feet. He never found any powder that would burn at that distance. They were only dark particles, or the ashes of powder, and certainly could not be found further than fifty feet from the muzzle, according to the strength of the powder. Occasionally cartridges lose their strength. If the shells are left in the hot sun the tallow or wax may melt, and if the rim of the shell is loose it may run down into the powder and kill the fulminate. The witness then described how shells were filled, showing that one might contain more grains of powder than another, owing to the carelessness of workmen. All this would lessen the power of penetration.

When the shell through which the ball was fired was examined, the witness said:

The ball had keyholed the window. By keyholed he meant that it struck the glass about a quarter sideways. A bullet striking the glass point blank would make a perfectly round hole. The hole in the window pane is elongated a sixteenth of an inch, and that shows that the ball struck it sideways. Balls did not keyhole without a cause. He had seen a hundred shots fired from a pistol through one smaller than this. He had seen Dan Wesson, of Springfield, do it a hundred times. The shape of the hole in the window was not due to the angle from which the bullet was sent, but was caused by the position of the ball when it struck the glass. The glass did not break the force of the bullet. The likelihood is that when it left the muzzle of the rifle it canted a little, as is frequently the case when a rifle is foul or dirty. Sometimes bullets turn clear around before striking. If a gun was not rifled the bullet would tip as soon as it left the muzzle.

This very interesting question of the wasting or dispersion of the ball was also given by Mr. Leet:

The questioning turning upon the percentage of waste resulting from the peculiar fragmentary condition of a bullet after it has reached its object, the witness said that he knew no way of gauging it. He judged that it was according to the resistance offered. He had seen 220-grain bullets lose more than half of their weight. The loss ranged from 1 to 137 grains. That was his experience for twenty years. It depends in a great measure upon the speed with which a bullet is started and the resistance it meets. A bullet will lose one grain when it strikes the resistance of a bullet about the same would gain weight, because the sand would adhere. He said that if a bullet should strike a glass point blank another ball cast in the same mould would not go through the hole without scraping the lead from its side.

With the guilt or innocence of the accused in this case we have nothing to do. We only bring the evidence in regard to rifles and ammunition as interesting to our readers, and as likely to settle quite a numerous category of questions.

For Forest and Stream and Rod and Gun. SHOOTING RUNNING GAME WITH THE RIFLE.

THE best of shotgun shooting is tame compared with rifle shooting on large game; and even of this the best standing shooting is tame compared with shooting it on the run. Not only is this the very acme of the pleasures of the field, but it is also a great necessity, and, on some kinds of ground, almost indispensable to success. But, in the whole line of shooting, there is nothing which at first is so provokingly puzzling. The number of deer which will bound away unharmed from the best of standing shots is amazing. Nor will skill with the shotgun be of any avail at first, but rather a hindrance. Col. Gildersleeve last spring, at the Creedmore running deer target, made only two hits out of thirteen shots, and this although all thirteen shots were on open level ground, all under precisely similar conditions and at a known distance, speed and jump of the deer.

Nearly all of the trouble comes, first, from a disregard of two simple principles; and, second, from ignorance of the extent of their influence, even when thought of. And this information nearly every one has to work out for himself through a long series of mortifying failures. Though nothing

can supply the place of practice, directions can still go a long way toward keeping one out of errors into which, if left to himself, he will certainly fall—which will surely be fatal to success, and which he will not learn from his own experience, except at a price that will make him mad every time he thinks of it. These principles are very simple in the abstract, but it is astonishing how one will overlook them in practice. The first is, that an aim that is close enough for the best of shotgun shooting is not close enough to hit one deer out of ten at any considerable distance. Nearly every deer hunter has found out to his disgust the wonderful ease with which a deer, standing broadside at only fifty yards, may be missed with a rifle. The least little carelessness in aim is apt to be fatal to success. Therefore, the very first thing to do when a deer starts is to recollect that you have a rifle, and not a shotgun, in your hands. Then throw the rifle ahead of the deer, and get your eye on the sights the very first thing; and before you keep it there, making the sights the most prominent object of attention. You will have no trouble in seeing your game plainly enough, but a great deal in keeping your eye properly upon the sights. It is best to throw the rifle ahead at first (unless in a straightaway run), because, if the sights come on him, you will find the temptation to pull almost irresistible.

The next principle is, that if the deer be at any distance, or going at any speed, it is not close enough to him, you will not touch him, unless he is running very low and nearly, or quite, straight away. Therefore, you must hold on the spot where he will be when the ball gets to him. This distance necessary to hold ahead is surprisingly great, even to one perfectly familiar with the distance necessary to hold ahead of crossing ducks with a shotgun. I have seen the ball strike behind a deer at about seventy-five yards when I held fully five feet ahead of him. But as I was usually running from two or three feet will be enough to reach him back of the shoulder at seventy-five yards; and this holding ahead must positively not be neglected, even when the game is running slowly or quattering, if it is at any distance over thirty or forty yards. Even on a deer walking at sixty or seventy yards you will be apt to make a "punch shot" unless you see a little strip of daylight between your sights and his breast. On hares running—often quattering at only twenty yards I have invariably struck behind them when holding on the body instead of a few inches ahead. The amount of margin necessary to allow at different distances can be learned only by practice; but with a small wheel rolled where you can see the balls strike you can learn a great deal about it, and if you can make the wheel bounce by obstructions on a hillside it will be much better.

Strict attention to sights and simply holding the right distance ahead will reach nearly all large game, except deer, which is the hardest of all to hit. So far, we have supposed him to be running low. But generally a running deer is a bounding deer and often a bounding deer. The black-tailed deer especially often runs as if bounding on India rubber, rising, apparently without effort, from one to two feet at every jump. Then running over ground that is rough, rocky, covered with logs or low brush, a deer is nearly always jumping with high and often irregular springs. Now (unless very close), just as surely as you shoot at where he is, just so surely will the ball strike where he is not. The best way is to catch him as he strikes the ground, and for this purpose, where you have time, you must keep the rifle ahead of him for several bounds, until you catch the length and height of his jump. Then, when he is at the highest point, point at the spot where he will be when he strikes the ground, and, above all, be sure and pull when he is in the air. To get the right distance ahead, and at the same time the right elevation, and pull just at the right time, is a very nice operation, and a miss is never discredit; but, with care and coolness, you will in this way make shots over which you will chuckle for a month. If a deer be running low you may disregard this up and down motion, and running very fast you must disregard it; but when bounding high you cannot overlook it with safety, and in straightaway shots you must hold about for his knees when he is up.

Nothing is so essential as care and coolness. Don't try any snap shots, unless it's your only chance. I have twice wiped the eye of a much better shot, whose anxiety to get first shot made him a little careless and made him miss each time a good chance with fifty yards. To quiet your mind, come to the point, and make it your main object to send the ball to the right spot, even if your game gets a few yards further off. In timber you may be edified by the "chup" of the ball into a tree when you thought you had a sure thing on the deer. Always look out for an open place to shoot through.

The sights should be moderately coarse, and the front one of ivory, except the one on snow, where brass or gold is the best. The best of the "back-horn" side of the back sight, so that you can get a clear view of your game when holding ahead of it. The "back-horns" are really of no use but to prevent reflection of light from the corners of the notch, and this you can do as well by rusting them with iodine or acid. I go so far as to cut down the sides until the notch stands in a little cupola in the middle, affording a perfect view all around it. I find such one worth a cartload of back-horn sights, though it takes a little practice to get used to it, when it is caught just as quickly by the eye as any other. The pull of trigger should be about one-half to two pounds. A set trigger is an abomination for running shooting; equally so is the Creedmore three-pound pull.

Try these directions and report progress. If they don't work it will be because you are deceived in distance, have a poor rifle or have the deer so nervous that he will bother any one until he has killed several deer.

Minor's Ranch, San Diego Co., Cal. T. S. VAN DYKE.

APOLLINARIS WATER COMPANY.—Some very untrustworthy and malicious articles having been written and circulated in regard to the Apollinaris Company, the agents desire us to convince the public of the falsity of all such assertions, advanced by rivals who are water manufacturers. Something has been printed, headed "U. S. Assay Office," derogatory to Apollinaris Water. The best proof for such statements pass unnoticed is that at present in all the U. S. hospitals Apollinaris Water is used in the large quantities recommended by the surgeons. The popularity of this water, in spite of jealousies and futile attempts to check its progress, is ever increasing. While in 1874 Great Britain used some 300,000 bottles, last year the amazing amount of 400,000 bottles were taken. The demand in the United States quite equals it. It does not surpass, the European figures. Apollinaris Water is induced by the long and successful history of its use, and by the fact that it is a pure natural water, unadulterated, untouched, and that it is bottled as it flows from the spring, is attested by the United States Consul at Cologne. Messrs. Frederick de Barry & Co., of New York, are the sole agents in the United States and Canada.

Rational Pastimes.

ARCHERY BOWS.

NEW YORK, Sept. 22.

EDITOR FOREST AND STREAM:

I see, in your article on archery last week, that your correspondent has broken a number of bows of Highfield's make. I presume some bows will break, the same as some guns will burst, even when made by crack makers. The trouble is, bows are made too cheap—that is, people are not willing to pay for a good article, and therefore the makers must slight their work to get it cheap enough. I have yet to hear of any of Aldred's bows breaking except one lady's bow out of about one hundred sold, but every one complains of the price of his bows, while admitting that they were splendidly. I have used a lancewood bow made by Aldred over five months, almost daily, and it is as perfect as the day it was bought.

"Archer" should remember that in the tie mentioned in his letter the greatest number of hits wins. I do not agree with him that forty yards is the best distance to test the shooting, but it is far from the best for the season's shooting. I hear of one club using a four-foot target at twenty yards! One might as well shoot at the side of a barn. The trouble is that three-fourths of the bows sold are not capable of sending an arrow with any accuracy over forty or fifty yards. The American bows are most always stamped with a weight beyond the true one. Probably they may pull up to weight when tested, but they soon lose their strength.

I believe Dr. Carver only uses a bow at short range. Any wood will do for that style of bow. Mr. Maurice Thompson, I believe, has never used a yew bow, and he wrote me he never heard of Aldred's make. The bows (lemon-wood and maplewood) he praises are among the poorest woods. Hundreds of years of experience have given the English a big start in these matters, and we must not expect to beat them the first season.

I do not doubt but split bamboo and cedar, or a combination of the two with hickory, may make a splendid bow. If the demand continues, some one will probably find the material among our native woods, but I doubt if a perfect bow can be furnished for \$3.

W. H.

ONITANT ARCHERS.—24-inch target; distance, 30 yards:

Wabash Merry Bowmen won by 201.

LACROSSE.—At Prospect Park, Brooklyn, last Saturday, a game of lacrosse was played by players chosen from the Brooklyn Lacrosse Club, the Brooklyn Athletic Club, and the New York University Club. One side was led by Captain Cluff and the other by Captain Calder. The result of the struggle was five goals won by Captain Cluff's side and three goals by Captain Calder's side. The members of the Brooklyn Lacrosse Club, the Ravenswood Lacrosse Club, the New York University Club, the Brooklyn Athletic Club, the Metropolitan Athletic Club and other associations that exercise in the open game, including base ball clubs, will unite in giving a grand lacrosse entertainment next Saturday afternoon at the Capitoline Grounds—in all twenty-seven different games—for the benefit of the yellow fever sufferers.

A championship match at Toronto, Sept. 21, between the Toronto and Caughnawaga Indians, was won by the latter, who took the first, fourth and fifth games.

NEW YORK VS. AUSTRALIA.—The eighteen cricketers of the George, Staten Island and Manhattan Clubs, who are to play in the grand match at Hoboken on Monday and Tuesday next, were selected on Tuesday, and they are as follows: S. T. Soutter, of the St. George Club, bowler; J. K. Cross, of the St. George Club, wicket keeper; A. Marsh, of the St. George Club, captain; E. W. Leonard, of the St. George Club, bowler and slip; C. W. Bance, of the St. George Club, point; J. B. Sleigh, of the St. George Club, cover point; J. B. Cashman, of the St. George Club, bowler and slip; J. Frazer, of the St. George Club, mid-wicket; P. Allen, of the St. George Club, mid-wicket; P. J. Conover, of St. George Club, long leg; G. Giles, of the St. George Club, bowler and short leg; A. G. G. of the Staten Island Club, bowler and slip; J. A. Moore, of the Staten Island Club, bowler and slip; J. A. Sprague, of the Staten Island Club, bowler; E. W. Stevens, of the Staten Island Club, square leg; W. Brewster, of the Manhattan Club, bowler and third man; B. Greig, of the Manhattan Club, bowler field; F. Rogan, of the Manhattan Club, long field. Substitutes—Messrs. Maynard, Eyre and R. Ronadson, of Staten Island.

THE ELEVEN OF PHILADELPHIA.—The following eleven has been selected to represent Philadelphia in the approaching match against the Australians, viz.: Francis L. Brewster,

R. Nelson Caldwell, Edward T. Comfort, John Hargrave, Thomas Hargrave, Edward Hopkinson, Sutherland Law, Charles A. Newhall, Daniel S. Newhall, George M. Newhall, and Robert S. Newhall.

AMATEUR CHAMPIONSHIPS OF AMERICA.—The ninth annual fall games and championships of the New York Athletic Club (grounds 150th street and Mott avenue, Mott Haven, New York City, 1878, to amateurs), will be held on Saturday, October 12th, 1878, commencing at two o'clock p. m., for which entries will close on Saturday, October 5th. The programme will be as follows, unless circumstances should demand a change: 100 yards run, running high jump, one mile run, putting lead, 440 yards run, running broad jump, 120 yards hurdle race (10 hurdles, 3ft. 6in.), throwing the hammer, 220 yards run, three mile run, pole leaping, throwing 50lb. weight, three mile walk, half mile run, tug of war (teams of four, two substitutes). Gold, silver, and bronze medals will be given in each championship game, excepting tug of war, where a set of colors will be given. An entrance fee (not refundable) of one dollar per man, for each and every game, must accompany all entries. No communication will receive attention unless addressed to the club box; and all persons, or particularly requested not to call upon the officers at their places of business. Handicap games will be given on election day. Entries can be made with the Secretary, N. Y. Athletic Club, P. O. Box 3101, New York.

SHORT HILLS ATHLETIC CLUB.—The annual fall meeting will take place Oct. 6, beginning at 3 p. m. The programme consists of ten events, the entries for which close on the 28th inst. All communications should be addressed to A. Noel, Jr., Secretary, P. O. Box 893, New York.

PLAINFIELD ATHLETIC CLUB.—The fifth annual games will take place on the new one-half mile track belonging to the club at Plainfield, N. J., Oct. 9. Entries close Wednesday, Sept. 25. Address J. A. Demarest, P. O. Box, 763, Plainfield, N. J.

MANHATTAN ATHLETIC CLUB.—This club held their annual games at the club grounds, Eighth avenue and Fifty-sixth street, this city, with the following programme:

100 Yards Run Handicap—Trial Heats.—First heat—H. I. Second New York, 11 yards; 1st. J. Lafon, M. B. C., 1 yard, 2. Second heat—E. Rube, New York, 4 yards; 1st. J. O. S. E. H. Van Arsdale, G. A. C., 8 yards; 2nd. Third heat—E. O. Gurney, M. A. C., 8 yards; 1st. Fourth heat—H. H. Morley, S. A. C., 8 yards; 1st. Fifth heat—C. F. W. Damburner, S. A. C., 11 yards; 1st. Sixth heat—H. F. Wilkinson, Adelphi A. C., 7 yards; 1st. Seventh heat—J. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Tenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eleventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twelfth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirteenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fourteenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifteenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixteenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventeenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighteenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Nineteenth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twentieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Twenty-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirtieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Thirty-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fortieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Forty-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fiftieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Fifty-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixtieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Sixty-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Seventy-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eightieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Eighty-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninetieth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-first heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-second heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-third heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-fourth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-fifth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-sixth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-seventh heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-eighth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. Ninety-ninth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd. One hundredth heat—J. F. B. Barnes, Greenpoint A. C., 8 yards; 2nd.

Running Broad Jump.—W. T. Livingstone, H. A. C., 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Shot.—W. T. Livingstone, H. A. C., 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Putting the Shot.—J. I. Smith, Xonkers Lyceum, 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Putting the Shot.—J. I. Smith, Xonkers Lyceum, 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Putting the Shot.—J. I. Smith, Xonkers Lyceum, 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Putting the Shot.—J. I. Smith, Xonkers Lyceum, 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Putting the Shot.—J. I. Smith, Xonkers Lyceum, 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

Putting the Shot.—J. I. Smith, Xonkers Lyceum, 1; 19ft. 4in. J. I. Smith, Xonkers Lyceum, 2; 10ft. 3 1/2in.

The proprietors of Beacon Park, Boston, are discussing the laying of a cinder path inside the trotting course. This is designed for the bicyclists, who are looking for a suitable track.

Why do we hear nothing of the bicycle in New York? Boston has a new club, making the third now organized.

BADGES, EMBLEMS.—Mr. N. M. Shepard, of No. 150 Fulton street, New York, has sent us his catalogue containing the innumerable different pieces of work made by him. As the catalogue shows, Mr. Shepard is the manufacturer of the major part of the medals presented by the Forester and Stream in this season to various rifle clubs and sportsmen's associations. The work made by Mr. Shepard is in the best of taste, of fine workmanship, and can be furnished at a reasonable price. Having competent artists, designs can be furnished with promptness.

HERMANN, THE PRESTIDIGITATOR.—Nothing can be more simple, more readily understood, than the tricks performed by Hermann at the Aquarium. This sleight-of-hand personage walks among the audience and asks for eggs and lemons. Now it is well known that ladies and gentlemen never, at least in New York, go to an evening's entertainment without eggs and lemons. It so happens, however, that the exact people Hermann asks to furnish him with eggs and lemons do not appear to have them. This makes little or no difference, for eggs and lemons are instantly forthcoming from ladies' hats and gentlemen's shirt collars. Hermann, having collected them a walnut, a lemon, an orange and a lady's gloves, puts all these articles on different labels, and then he passes the nut into the egg, and the egg into the lemon, and the lemon into the orange, and next with a knife he cuts the whole of the various things in two, and in the nut, which is in the middle, are the gloves. It is just as easy as that. All that is required is to know how to pour one thing into another. Something else he does so ridiculously commonplace that it is hardly worth repeating. Hermann shows you two white rabbits. There they are. Then he puts one rabbit into the other, and there is but one rabbit. Next he makes that single rabbit swallow itself, and there is not any rabbit at all. Of course there is nothing in that; anybody can do it. It is real child's play another manœuvre Hermann goes through. He walks right into the middle of the audience with a pocket-handkerchief, not an extra large one. He lifts it about and shows you that there is nothing in it, and the next minute he draws from under it a globe with gold fish swimming in it. You have only to go to any gentleman's furnishing store, and of course you can buy a dozen pocket-handkerchiefs with aquaria in them. All the things which Mr. Hermann does are of this easy matter-of-fact character. Of course there was a very large audience of people, who were amazed at what they saw, and laughed and wondered. Now we should like to know what there is strange in an old bald-headed man's hat, which when taken off the man's head is found to contain several bushels of cut flowers. Old gentlemen habitually go about New York this crowded with flowers. Just let people go to the Aquarium and see Hermann, and when they come home they will reason it all out and know quite as much about it as we do. But how the watermelon was found in our soft hat, or how a pair of brogans and a shovel came out of our neatly folded umbrella, we must confess slightly puzzles us. Maybe some of our readers can explain.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

W. T., New York.—Quite safe.

G. L. D., Boston.—A maker in excellent repair.

S. V., Warren.—Mr. J. J. Berry, Hockensack, N. J., wishes your address.

H. W. H., Montreal.—What you want is made by W. S. Goss, Neosho Falls, Kansas.

J. A. D., Cambridge.—The parties who advertise the goods you want in our paper are quite reliable.

R. E. D., Georgetown.—The gun used by Dr. Carver is a moderate choke. We never compare guns.

R. G. C., Bay Ridge, L. I.—In shooting glass ball matches the trap should be placed level on the ground.

KANA PIPIRE, New York.—We have restored the rights of the reed bird. The anecdote was unintentional.

W. B., Sndianapolis.—We know nothing about the responsibility of the house. We have declined their advertisement.

R. S., Pittsburgh.—We know nothing about the firm you mention nor of the guns they sell. We decline advertising them.

BASS, Norfolk.—We use here for striped bass shudder crab and shrimp, also spearing. Would be glad to hear from you.

W. L., Lowell, Mass.—For the "Rules of the National Association of Amateur Sportsmen" write to Weed, Parsons & Co., Albany. Price not over 50 cents.

ROCKY CROIX, Halifax.—Vols. 1, 2 and 3 of F. and S. we cannot furnish. Vols. 4, 5 and 6 at \$4 apiece, bound, and 7, 8 and 10 at \$5.50 apiece, bound.

PLEYTER, Boston.—You will find our report as full as any published. Write to T. Stagg, Chicago. Chilled shot is now used in pigeon matches and its use is increasing.

P. W. P., Syracuse.—Liver-white is a good color, and in selecting a dog try and keep to the same color. Could not tell you of any good dog in your neighborhood. Expense varies from \$25 upward.

O. E., Boston.—Best book obtainable is Hoyle. It is written up to date and embraces the annals of poker by the American Ambassador at the Court of St. James. Costs from forty cents to \$2, according to size.

ROVER, Philadelphia.—Deer hunting is not prohibited in Pennsylvania this year. That was the answer which should have been given last week, but the "not" was not, therefore it was not not. Certainly not.

J. V. M., Philadelphia.—The load for your gun would be 3 1/2 drs. powder, 1 oz. shot. Wet it on your oval-load by 1/2 dr. powder. Your wads are all right. Your make of gun is excellent, among the very best.

N. W., Hoboken.—Where could I see the English Kennel Club book? Are the Baltimore field trials to take place? Do you know the full pedigree of "1" Ans. 1. We have it. 2. Indefinitely postponed, we are sorry to say. 3. We do not know.

H. F. T., Concord.—About how many shot will a good 12 bore put in a 25in. circle, 9in. balls-eye at 40 yds., 4 drs. powder, 1 oz. No. 6 shot? Ans. Take two-thirds of the coated pellets as the maximum of pattern, and calculate from that. Gun mentioned is an excellent one.

B., Sterling Run, Pa.—We cannot procure the dog you wish. We hardly think a cur city dog would answer your purpose. Could not harry for freedom from disease in dogs taken from the pound. It might be curious to note the effect of a change to country scenes upon a dog which has been brought up in the city.

K. R. B., Newark.—Judges betting on the result of a boat race are not necessarily disqualified from acting thereby, though such conduct on their part should be avoided. If a boat's crew is not satisfied with the judges' decision, they may appeal to the referee, whose decision is superior to that of the judges and final. You must therefore carry your case to the referee, and abide by his decision.

M. F. A., Philadelphia.—Your seven-months dog has probably a commencement of distemper. Feed him low—no meat—and give him small doses of castor oil. If the apparent pain in passing water continues, let him take a few drops of ass's spirits of nitre. For the fleas wash him well, and rub some creosote on him, washing him afterward. If the sores continue, inform us. In the meantime, rub them with an ointment of flour of sulphur and lard.

M. S., Philadelphia.—The dimensions you send, 19 1/2 by 23 1/2 in., will make a fairly fast boat. Cannot give you further particulars, as you are not specific enough in your letter for what purpose you want the boat. A good book on boat building is "Nelson's Boat Building for Amateurs." Can send you one upon receipt of \$1.25 as soon as shipment arrives from England. Will give more information on the subject of boats in future numbers of this paper.

C. S. M., New York.—Desmond, of Peck Slip, is an excellent and reliable boat builder; also C. B. Elliot, cor. Quay and Franklin st., Greenpoint, L. I.; and John Kyle, 132d st., and 4th av., River View. Cost of light gal., \$75 to \$125, according to finish and workmanship. For books on training see "Oars and Sculls," price about \$2.50; Englehardt's "Rowing Almanac," 15c; or "Boat Racing," by Brickwood, 3c. Can procure you either.

BASS, Loch Haven, Pa.—Describe the proper tackle to use in trolling for black bass. Which is the best artificial minnow, and the proper size? What size and style of reel, and cost of above articles? Ans. For hand trolling, No. 1, braided line line, 100 yds.; for rod, a No. 6 line, same length, 100 yds. No. 5. Artificial minnow is good on special waters; use No. 4 Calceola. A No. 5 multiplying reel with drag line, \$1.50; minnow, \$1; reel, \$5.50; spoon bait, 75c.

M. W. C., Danville, Ala.—1. Will trout and black bass live and breed together (I don't mean cross), or would the black bass drive out or devour the trout? 2. Will trout and gold fish live and breed together in a pond fed by living springs? Ans. 1. This question has caused some discussion. We think if fish of equal size are introduced they will grow together well enough in ponds. Feeding trout prevents cannibalism and the predatory habits. 2. Sun fish might suffer, but not materially.

R. C., New York.—Since Courtney entered the rowing arena as a professional he has not been beaten, except through accident. One by Riley, on Greenwood Lake, when Courtney became sick, supposed to have had his face poisoned; and the second time by Frenchy Johnson, on Silver Lake, Boston, when Courtney was taken ill. He was also capsized out of his boat in a race with "Jemmy," on Seneca Lake, presumably through hidden obstructions, but the match was declared off by the judges.

G. W. W., Orange Lake, Fla.—We know of no builder of repute in your neighborhood. You had better write to Richard Wallen, John Mumm, or Pat. McElhann, in care of this office. They all build very fast boats, and we can obtain for you their lowest figures, if you send further particulars. There will not be much difference in freight, whether you ship from here or from New York. Cost of shipment by schooner will be nominal only, compared to price of boat. Send nearest seaport having connection by vessel with New York.

C. F. W., Minneapolis.—To make a salt lick for deer, of course must first have knowledge of the habits of the animal, and where he frequents. A rather marshy place is selected, and in the process of accumulating the deer to the new salt lick takes time, it is commenced in spring. A quantity of hard wood ashes is good to begin with. These may be rammed hard in a barrel, a little water poured on them so that they cake, and when dried broken up into pieces, and plentifully distributed around the place. Rock salt, rather hard to obtain, is, of course, the best. But as rock salt is soon lost by the action of water, it does not remain long. If used, put it in little openings in the trunks of trees. Hard salt cake, from some factories, is used with advantage. If started in the spring, the place ought to be visited every two weeks, in order to renew the salt. In the South and West the soil of old smoke houses, when the ground has been freely saturated, is much sought after for the purpose. It takes time and a great deal of trouble to make a salt lick.

E. A. M., Broadhead, Wis.—For flat-bottom boat 16ft. long, 3 1/2 ft. beam; make salt of stout drilling; use clothes-line stirr for gear. Place mast 5ft. from bow. Cut sail as a "standing luff," that is, a luff sail with gaff and boom. Make it 9ft. on foot, 6ft. 6in. on head. Cut the forward edge, or luff perpendicular to foot, and make it 1ft. Keep the forward end of boom down in its place about 8ins. above rail by means of light lashing to thwart, or eyebolt in mast 6in. below the boom. Have 100 lb. diameter at rail height. Hoist line, diameter one-third the length on, taper toward ends; gaff or yard 1 1/2 in., and one-third in. Sheet, single end of rope. Halliards rope through small block at mast-head, or through sheave in the spar. Have an iron ring with hook, or bill forged on its lower half and an eye above it. Slip it over the mast and splice lower end of halliards to the eye. Have a thimble strapped on the yard 10ins. from forward upper corner, or "knock" of the sail. When you want to hoist hook the yard to the bill on ring, or traveler, and sway up on the halliards. This traveler serves to keep yard close to mast. Or you may cut the halliards sheave close to where yard will come when check up, thereby doing away with the ring. What method is preferable. For tacking employ a "lee board." Take 3/4, or 1 1/2 in. board, cut it narrow on top and have 1 1/2 to 2 square ft. hinged. Hang it on a pin or peg on rail by a snort rope, both ends rope through holes close to each other in the board, knot the ends, leaving the right or eye on inside. By shifting the peg any balance desired may be obtained and the boat made to tack. Have a light guy from forward to lower part of the board to keep it in position, or make other device in hauling it.

BATH, September 13, 1878.

H. C. SQUIRE—Sir: I received the can of Dittman (C) powder you sent me, Aug. 28. It is the pleasantest I have ever used. I shot a pair of young Hareington gun at 60 yards 18 birds 1 1/2 oz. No. 8 shot out of sight with 3 1/2 drachms Dittman powder. My shooting is mostly sea shooting. Would not the B powder be better for me? Please send me the terms for it in quantities, and I will send cash. I gave most of the first can away, as none has been seen and he before.

1460.

C. H. GREENLEAF.

THE BICYCLE.—At the Attleboro, Mass., Farmers' and Mechanics' Association Exhibition, Oct. 3, there were bicycles of various makes on exhibition. First prize, an elegant diamond racer, valued at \$100; second prize, silver pitcher and goblet, valued at \$25. Entries to be made on or before Oct. 1 to Frank L. Barden, North Attleboro. For particulars apply to Albert A. Pope, 87 Summer street, Boston, or to Frank L. Barden, North Attleboro.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, SEPTEMBER 26, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,
Business Manager.S. H. TURRILL, Chicago,
Western Manager

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, September 27.—Cricket: Young America vs. Old Haverfordians. Trotting: Syracuse, N. Y.; Dover, N. H.; Quincy, Ill.; St. Louis, Mo.; Dover, Del.; Manhattan, Kan.; Columbia, O.; Albany, N. Y.; Youngtown, O.; Lewistown, Pa.; Kentville, N. S.

Saturday, September 28.—Nantux Boat Club Open Amateur Regatta, Reading, Pa. Cricket: Germantown vs. Young America, Nicetown; Belmont (2) vs. Merion (2), at West Philadelphia; Young America (Jr.) vs. Germantown (Jr.), at Turpike Bridge; Manhattan vs. Belmont, at Prospect Park; Longwood vs. Highlandville, at Longwood. Staten Island Athletic Club Games.

Sunday, September 29.—Hughes-O'Leary Walking Match, at Gilmore's Garden. Running Meeting at Syracuse, N. Y.

Tuesday, October 1.—Hughes and O'Leary Walk. Cricket: Eighteen of New York vs. Australian Cricketers, at Hoboken. Trotting: Syracuse, N. Y.; Parker City, Pa.; Rochester, N. Y.; Norwich, Conn.; Cincinnati, O.; Dover, N. H.; Philadelphia, Pa.

Wednesday, October 2.—Hughes and O'Leary Walk. New York vs. Australians, as above. Courtney-Hanlan Match, at Lachine, Canada. Trotting as above, and at Middletown, Del.

Thursday, October 3.—Hughes-O'Leary Walk. Philadelphia Eleven vs. Australian Cricketers, at Nicetown. Trotting as above, and at Danbury, Conn.

Mr. Hallock has returned, and is again at his post.

TWENTY-EIGHT PAGES.—Circumstances have compelled us to print twenty-eight pages again this week; indeed, our issues are now more frequently of twenty-eight pages than of twenty-four. Our advertisements press so seriously on our space that we have to cut our garment according to the cloth. It is prosperity which is bearing on us so heavily.

AGAIN.—We say it once more, and shall repeat it from time to time so long as there is need to do so: All drafts, checks, and postal money orders sent to us should be made payable to "The Forest and Stream Publishing Company." By observing this rule our subscribers and advertisers will save themselves and us much needless annoyance.

THE SCULLING CHAMPIONSHIP.

AFTER many delays and hitches the two best oarsmen in America are finally to meet each other and test their claim to the championship of America. From a strictly technical point of view, the championship is now held by Hanlan, of Toronto, he having defeated Evan Morris in a five mile race at Pittsburgh in June, this year. The coming contest over the Lachine course, near Montreal, will therefore go to show whether he is able to hold the title against all comers, or whether the United States can produce the man to show him over the course. The event must undoubtedly be set down as the most important in the annals of modern boat racing in America. The old line of champions, the Browns, Hammills, and other such gentry, some of whom are even now pulling in golden shells o'er tideless and glassy-smooth rivulets of milk and honey, are fast leaving this wicked world for a better one, where fools and hidden obstructions are not known. They and the oarsmen of their day belong to a race of the past. Rowing during the last few years has taken such an energetic start in new and more popular directions that the old knights of the short, choppy dip and blistering seat have been left a long way astern and cut a sorry figure alongside the handlers of the spruces of the present day, with their long swing of 23 or 29 and the far reach of the sliding seat. Never before have the people on this side of the Atlantic lent such favorable countenance and given so much encouragement to rowing men generally, whether amateurs or professionals. No other year can show the rapid succession of regattas and the numerous attendance therat, the public has witnessed during the season, now about drawing to a close with the great match of the Titans of the United States and Canada. It is to be hoped that the environs and circumstances may prove what we should have a right to expect, but what, unfortunately, we can only pray for. The Lachine course at this time of the year is especially unfitted for shell boat work, and already lumpy water is seriously interfering with the practice spins of both men. That such an utter lack of stamina and judgment in arranging the preliminaries of so important a race should have been displayed by the backers and friends of the man from Union Springs, is for Americans south of the St. Lawrence a most unfortunate mishap. Instead of pulling the race on some neutral, quiet water, Courtney is carried off across the border and, *no less volens*, pitted against as tough a customer as ever he met, over a course unfavorable to him in the extreme, and upon terms the like of which have never yet been heard of in the history of boat-racing. A strange land, strange water, and strange conditions will do much to neutralize what there may be in favor of the best man we can put up to fight our battle with the wonderful Canadian. A more bungling piece of diplomacy than that shown by Courtney's agents we have no ken of. The Canadians completely overreached him and his men, and carried all before them. So Courtney will have to tackle his man for a prospective \$11,000 or nothing! What are the chances of the two? They are very nearly evenly matched, we should say. Hanlan has the prestige of a greater number of races with the best scullers to be found among us on his side, while Courtney has a wonderful string of victories as an amateur. As a professional he has kept remarkably quiet, his victories, chiefly over second class men—Riley, Plaisted and other light timber—cutting no very great figure upon his record. About the best thing Courtney can point to is the victory he scored in 1876 on the Schuylkill. He has pulled but a few five-mile courses, and should he take the lead October 3, he will find all the work he wants to hold out with Hanlan, whose wonderful stay is perhaps the most remarkable feature of his splendid sculling, and upon which not a few among his friends count with justice.

CORRESPONDENTS: GOOD AND BAD.

LAST week, in our issue of twenty-eight pages, we published communications from seventy-four correspondents, distributed as follows: Maine, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Kentucky, Tennessee, Louisiana, Texas, Michigan, Illinois, Indiana, Minnesota, Kansas, Indian Territory, and California, Ontario, Quebec, and Holland. The communications were narratives of sporting adventure, articles of scientific discussion, minor notes, and short news items. Of their authors four-fifths are, personally, utter strangers to us. These letters came to us through the mails. For their authenticity and reliability we must depend upon the integrity and good faith of the men whose names are affixed to them. In the course of a year we receive thousands of such communications. It would be no difficult matter to deceive us, and, through us, our readers. We believe, however, that in very rare instances is this done. The contribution published in our columns, as a rule, bears the stamp of its frank and manly author. We (that "we" means editor and readers, too,) occasionally, however, are imposed upon, and not in a good humored way either. We can appreciate a joke; we cannot endure the imposition of a correspondent who habitually and intentionally exaggerates, falsifies and misleads. Our readers must understand that if the FOREST AND STREAM is deceived month after month as to the character of a correspondent, it is simply because the FOREST AND STREAM is human and, with all humanity, subject to imposition. Moreover, to show how much serious harm to a newspaper a malicious purveyor of misinformation may accomplish, we publish the following complaint, from a

gentleman who has been securing subscribers for us in a State not a thousand miles away. We may premise that the revelation was as unpleasant to us as it was unexpected, and that the matter has been promptly attended to:

I was completely beaten out in—. This is partly to be attributed to a cause which I have had thrown at me many times in the past two months, and of which I would have written to you before, if it had not been that I thought I had escaped its influence. But the matter was mentioned to me again before I had been in this hotel ten minutes. At—, in this State, resides a man who corresponds for the FOREST AND STREAM, and the fact that he does write for the paper has prevented me from securing a large number of subscribers in no less than six different places. He is known in all these towns as a most scientific and unscrupulous liar, with a tendency to assumption, and a total disregard of facts. More than fifty persons who now take the paper have assured me that if he continued to correspond they would stop their paper when their subscriptions expired. I tell you the facts just as I hear them, and vouch for the injury done to your paper. He is a young man of some talent, but with an utter disregard for truth and actual facts. A gentleman in his town told me about one one-hundredth part of his statements would bear sifting, which opinion was corroborated by all the other sportsmen of the vicinity.

KEEPING A LION IN BRUCE'S TIME.

THIS is what Mr. Arthur G. Brown, the Superintendent of the Zoological Society of Fairmount Park in Philadelphia, writes us: "A full grown lion should have about fifteen pounds of meat a day. This at 44 cents per pound, which the beef used to cost us, would amount to within a fraction of 70 cents. The horse meat which I now use averages a cost of 3/4 of a cent per pound, reducing the amount to 11 1/2 cents per diem. As lions are generally not fed on one day in the week, this cost is reduced 1-7 of the above figures. The horse meat answers as well as beef, and as the meat is freshly killed it is richer and more full of blood than any beef which could be procured for such purposes. The quantity of food should be cut down at least 3 in hot weather, or the livers of the animals might suffer. Traveling shows feed less than this, but this is our basis."

The query we had put to Mr. Brown arose from a quaint old description of a lion and how he was kept, which has lately been exhumed from the exchequer rolls of Scotland. Robert Bruce, the doughty king of Scotland, had a lion. Perhaps he who had been taught patience from studying a spider in his toil found instruction in a lion. Bruce was in the habit of going around from place to place accompanied by his pet. The archives tell us that it fell on the burgh of Perth to find a house for the brute, and though the lion had a mansion to himself, the Queen and her two sisters were lodged in a double bedded room. What interests us, however, is this fact, that to keep the lion for a year the kingdom was mulcted with a charge of £6 13s. 4d. Those not acquainted with the Scotch pound in the Fourteenth Century, might think this an extravagant charge; but the pound Scotch in those days was only 20d.; therefore, £6 13s. Scotch, was about \$2.50. As money in the Fourteenth century was worth ten times more than it is to-day—that is to say, that its purchasing power was ten-fold—it is apparent that the expense of keeping that lion was in fair proportion to the cost of beef or mutton. Anyhow, civilization has certainly advanced since the time when Bruce kept a lion, for feeding animals in zoological gardens has been brought down to a science. Some data on this curious subject can be found in old annals. The cost of keeping the wild beasts for the Roman gladiatorial combats is given somewhere. We sometimes think that one of the most interesting works which could be written would be one devoted to the keeping of wild animals in a state of captivity, and matter of the most useful character could be derived from it. We have looked in vain among libraries for a book of this kind, which would be philosophically constructed and thorough in its character. Returning to the lion of Perth and the Philadelphia lion: why the former cost some \$3 to keep, the latter could not be fed on beef for less than \$30 a year. We must remember, however, as has been before stated, that a value of \$3, gold or silver, five centuries ago would have had a buying or exchanging power of fully \$40. This little bit of antiquarian zoological lore, when the value of the Scotch pound is understood, is no longer puzzling to the political economist, and it is quite possible that Mr. Reiche, under similar circumstances, could not have fed a lion cheaper than King Robert Bruce's keeper.

A WELL MERITED HONOR.—Professor Spencer F. Baird has received the silver medal of the Society of Acclimation of Victoria, in recognition of his introduction of salmon in the Australian colonies.

THE SHARPS RIFLE MEETING.—The matches at the Sharps Rifle Range, Bridgeport, Conn., last Tuesday, were successful throughout, and the occasion a most pleasant one. The fund for the Yellow Fever Sufferers thus raised will in due time be forwarded through the FOREST AND STREAM.

THE YELLOW FEVER FUND.—We have to-day handed to Mayor Ely \$7, sent to "The Sportsman's Contribution"—J. C. Willetts, Skaneateles, \$5, and C. J. Kinyon, Owatonna, Minn., \$2. Total, so far, received by us, \$23. There are many weeks of suffering yet to be gone through in New Orleans, Memphis and many other places. We are still ready to receive money for the purpose designated. We are quite certain that many of our friends will respond. "He who gives quickly gives twice." So says a good old Latin proverb.

CARESMOOR.—We give to-day the whole story of the Fall Creedmoor Meeting. The American Team shot yesterday, and will shoot again to-day for the Trophy. The wonderful progress made by our people in practical and scientific rifle shooting is too manifest to require any further proof than that contained in our columns of the scores. The National Rifle Association has fostered the scientific rifle shooting of both soldier and civilian, and to this Association the gratitude of the country is due.

DEATH OF COL. T. B. THORPE.—Colonel Thorpe, the author of "Tom Owen, the Bee Hunter," and many other sketches of great brightness and humor, died on Friday last, September 20. Colonel Thorpe possessed talents of the most varied character, and not only wrote admirably well, but wielded the pencil with extraordinary talent. He was a natural historian of no small merit, and was among the first in the United States to declare that snakes were oviparous, a fact very much disputed some thirty years ago. Colonel Thorpe was among the earliest of our war correspondents, and his "Army of the Rio Grande," and "Our Army on the Rio Grande," are historical reminiscences of the Mexican war which are of great value. In his literary style Colonel Thorpe possessed to a marked degree wonderful clearness, brilliancy and force. Our pages have often been embellished by contributions from Colonel Thorpe, which were remarkable for their strength and vigor. Born in 1815, Colonel Thorpe was sixty-three years old at the time of his death. This passes away a true gentleman of the old school.

[FROM A STAFF CORRESPONDENT.]

ROCKY MOUNTAIN WANDERINGS. No. 3.

AS I sit down to detail to you the event of this our third trip in the mountains of Wyoming I cannot refrain from giving you a *coup d'œil* of our surroundings. I write by the flickering light of our fast-dying camp fire, and the inner man having being satisfied, the brain again begins to resume its sway, and in a meditative and retrospective mood I shall attempt to recall the not-very stirring events that have transpired since my last letter. The occasional snapping of the burning aspen logs, the "crunch, crunch" of our mules cropping the grass near at hand, and the dismal howl of the distant coyote are the only sounds that disturb my reveries. Close at hand lie my companions, stretched out at full length on the ground, gazing dreamily into the fire, their glowing pipes tightly clenched between their teeth. The wind whispers through the sage brush and sometimes throws up clouds of ashes, interfering not a little with my writing, and during the lull in the breeze we hear the subdued murmur of the stream by which we are camped. The grand old mountains, monuments of past convulsions and upheavals, tower on all sides and, while impressing us with our own insignificance, recall to our minds the tiresome clamberings of the last three days among their crags and cliffs and the results of our hunt in the Medicine Bow range.

Satisfied with elk, deer, antelope and bear hunting in the Freeze Out Mountains we, with the natural longing for the unattainable paramount ever in the human breast, had decided that mountain sheep alone would fill the cup of our enjoyment, and the day following our return to the Bow, Reed, Mort and myself started for the source of the Wagon Hound Creek. On the head of this stream, and on its tributaries, or among the rocky fastnesses from which they rise, we hoped to strike a band of sheep which, rumor told us, held their abode in that region. It is scarcely necessary to add that Tom, our teamster, completed the quartette, he being a most necessary part of the outfit, as indispensable, in fact, as mules wagon, tent and other impedimenta.

We camped the first night on Foot Creek, at the base of the range. Nothing of interest had occurred during a very tiresome day of jolting over twenty-five miles of rolling prairie in a springless wagon, with the exception of some poor shooting at sage-hens and antelope, and one excellent shot by Reed, who brought down a doe, on the "keen jump," at four hundred yards. One of the hams furnished us meat for supper which, with the excellent biscuit of Reed's concocting and a draught of crystal water from one of nature's fountains, completed a repast as acceptable to us as a far more pretentious banquet.

Next morning we were off shortly after sunrise, and by noon had reached the highest point in the canyon accessible by wagon, and made camp. The road lay throughout the whole distance, some fifteen miles, along the sides of Foot Creek, and the wooded slopes of the mountains reached high on either side. The timber was mostly dead, burned by the Indians when they deserted the hunting ground, but a second growth had sprung up and attained a height of about five feet, and its dark recesses looked very promising for deer. We saw no game, however, nor indeed any sign of it until far up the mountain, when an occasional elk trail crossed our path. Mountain birds, however, were noticed in godly numbers, and prominent among them were Clark's crow, whose grating cry was almost constantly heard, the fearless Lanner falcon, the dusky grouse, the violet green swallow and the broad-tailed humming bird with its gorgeous plumage. Our camp was advantageously placed in a small basin within fifty yards of a clear spring which gives rise to the main fork of the Wagon Hound and surrounded on three sides by timber, while just behind us rose a towering cliff of soft white sandstone, which stood out fierce and beetling like the prow of some le-

viathan ship. Its eroded faces, worn into a thousand fantastic shapes and pierced by many a hole and crevice, furnished resting and breeding places for the numerous birds seen sailing through the air about its summit. Close to the top on an inaccessible ledge, a pair of Lanner Falcons had reared their brood, and to this eyrie the family would repair at close of day sluting each other with the shrillest and most discordant screams. Above, below, and on both sides of the home of these fierce birds were hundreds of nesting places of the beautiful violet-green swallows (*Hirundo thalassina*), and these little fairy-like creatures flew hither and thither in clouds, utterly regardless of the presence of the falcons. It was a strange association, though one often seen in the West.

Immediately upon making camp we started out to inspect our surroundings. As one of the party remarked, "The country looked sheepy," but at a tramp of four hours through a most attractive region failed to disclose any recent sign of these animals. At one point we struck a fresh elk trail made by two or three wandering individuals, and later saw some tracks of deer, but were unsuccessful in our attempts to find either, and at last, tired, hungry and disgusted, we turned our steps campward. In Indian life we traversed our silent path over steep hills and down into deep, cool canyons. The sweet scent of the pines fills the air, and the dark, sodden ground beneath the green timber gives forth no sound. Now and then a pine rabbit jumps up in front, and scurrying away, stops short at fifty yards, and eyes us with amazement. A dusky grouse whirs up from beneath our feet, and skims down again into its leafy covert, surprised at the new animal that has invaded his quiet home. Just as we approach the camp a fine "black-tail" buck is sprung from a thicket of quaking aspens. He has made but a few jumps when a loud b-a-a-a-h from Reed stops him, and he turns his great, wondering eyes toward us. He lingers only an instant; but the stock has pressed the shoulder, the finger the trigger, and the bullet goes crashing through both shoulders and brings the noble animal to the ground. The deepening twilight gives us time only to butcher him and, admiring his fine antlers, still in the velvet we take some of the internal tibits with us to relieve the monotony of antelope diet, and hasten onward.

As we sit round our roaring camp fire that evening we listen to tales of former hunts and to stories of the Indian fights and white men's brawls of earlier days. Each in turn contributes his experience to the general fund, and scenes and incidents are narrated which took place in the mountains and on the plains, when game was more plenty and hunters fewer.

Before we sleep it has been decided to spend the following day in collecting bird skins and then to betake ourselves to other and more profitable fields. At break of day the deer is packed and brought into camp, and a fine fat fellow he is. Even as I write the sizzling, spluttering sound of his juicy chops, enjoyed at supper, still rings in my ears. Thursday is devoted to collecting and some valuable skins are added to our collection. No elk, deer, or sheep, however, are seen and so this morning we broke camp, and here we are.

The scarcity of game here is to be accounted for partly on the supposition that it is further south, as explained in a previous letter, and partly by the fact that last winter and spring there were many tree choppers on the head of Wagon Hound whose presence no doubt caused the animals to forsake the country.

It is a sad fact, but one that cannot be controverted, that even in the Rocky Mountains large game is each year becoming scarcer and more difficult to find, and certainly unless something is done to protect it we shall soon inhabit a country absolutely without large wild animals. The advocates of game protection should see to it that some steps are taken in the right direction before long. I shall have more to say on this subject in another place and at a future time.

This is a letter devoid of exciting incidents, but your readers must remember that the hunter takes the bad fortune with the good, and than in no breast does hope spring more persistently than in that of the ardent sportsman. Yo.

In Camp on Wagon Hound Creek, Wyoming.

YACHTING NEWS.

NOVA SCOTIA YACHT SQUADRON.—The race of September 7 of the Nova Scotia Yacht Club was, according to programme, to have been the last of the season, but the liberality of the R. A. and R. E., quartered at Halifax, provided for a final race, which was sailed subsequently, Saturday, September 14. The wind was strong from the N. E., but became fluky to windward afternoon. At 1:30 P. M. the yachts got away, as follows:

	H.	M.	S.
Lily, sloop, 5 tons, W. H. Weeks, M. D.	1	30	58
Pathe, sloop, 7 tons, L. L. Cape, Rev. 20th.	1	30	58
Nova, sloop, 5 tons, L. L. Hussey, R. E.	1	30	58
Seafan, schooner, 20 tons, Capt. Larcom, H. E.	1	40	33

Seafan, from her size, should have given the rest the slip, but she had to lug an extra ton of ballast, taken aboard just before the start, and was not up to her usual form. It was a turn to windward to the Ferry Buoy, and in making for it the
